Seminar 1 9:00 AM-3:00 PM

THE “NUTS AND BOLTS” OF BEHAVIORAL INTERVENTION DEVELOPMENT: STUDY DESIGNS, METHODS AND FUNDING OPPORTUNITIES

Susan M. Czajkowski, Ph.D.[1], Sylvie Naar, PhD[2], Deborah Ellis, PhD[2], Elizabeth Towner, PhD[2], Lynda Powell, PhD[3], Walter Dempsey, Ph.D. (Statistics); B.S (Math w/ Honors); B.A. (Economics, Statistics) all at the University of Chicago[4], Jesse Dallery, Ph.D.[5], Kenneth E. Freedland, PhD[6], Christine M. Hunter, PhD[7], Frank Perna, EdD, PhD[8]

[1]National Cancer Institute, NIH, Bethesda, MD; [2]Wayne State University, Detroit, MI; [3]Rush University Medical Center, Chicago, IL; [4]University of Michigan, Ann Arbor, MI; [5]University of Florida, Gainesville, FL; [6]Washington University School of Medicine, St Louis, MO; [7]Division of Diabetes, Endocrinology, and Metabolic Diseases, Bethesda, MD; [8]National Cancer Institute, Rockville, MD

This seminar will provide investigators who are interested in the design and preliminary testing of health-related behavioral interventions an opportunity to (1) learn about a new framework for behavioral treatment development -- the ORBIT model (see http://psycnet.apa.org/psycinfo/2015-03938-001/); (2) learn about appropriate study designs and methods for early-phase behavioral intervention research, including which methods are appropriate at each phase of the behavioral intervention development process; (3) apply the ORBIT model and knowledge about relevant methodologies to their own behavioral treatment development projects; and (4) identify early-phase translational research funding opportunities and develop grant applications to support intervention development research. The format will include didactic presentations, question and answer sessions, and small group discussion in which participants will be provided with advice to help them design their own behavioral intervention development project. NIH scientists will provide information on suitable funding opportunity announcements and advice on how to develop applications for NIH support. Extramural behavioral scientists will describe their own experiences in designing behavioral intervention development studies, bringing these “lessons learned” to bear in advising seminar attendees on their individual projects.

Didactic presentations will provide detailed information about methodologies and study designs most applicable to the early phases of behavioral intervention development (e.g., qualitative research, single-case designs, dose-finding studies, adaptive and fractional factorial designs, and pilot and feasibility studies), with ample time allotted for questions and discussion. In addition, experiential and small-group activities will deepen participants’ knowledge of and skills needed for designing a behavioral intervention development program, allowing time for tailored advice and feedback. Participants will also be asked to submit in advance a 1-2 page synopsis (e.g., abstract, research aims, hypotheses, methods) of a behavioral intervention development project, which can be one they are considering submitting for funding, along with specific questions they may have regarding the process of behavioral intervention development. These will be discussed in small groups led by NIH staff and senior investigators, allowing participants to receive detailed feedback and advice to enhance the quality of their grant applications for designing and optimizing behavioral interventions.

CORRESPONDING AUTHOR: Susan M. Czajkowski, Ph.D., National Cancer Institute, NIH, Bethesda, MD, 20892; czajkows@mail.nih.gov

Seminar 2 9:00 AM-3:00 PM

DETERMINING THE APPROPRIATE MIND-BODY MODALITY FOR GREATER CLINICAL OUTCOMES

Brad S. Lichtenstein, Doctorate of Naturopathic Medicine

Bastyr University, Lake Forest Park, WA

Mindfulness and mindfulness-based approaches have increased in popularity over the past decade as useful modalities for stress reduction. However, it is important to remember that mindfulness is only one of many self-soothing mind-body medicine strategies. Unfortunately, researchers and clinicians typically focus on one particular method, failing to address variations in individual stress response patterns. Acknowledging the necessity for a person-centered approach to care, determining which of the numerous mind-body approaches that is best suited for the individual is paramount. To address this issue, Smith proposed a self-stress theory recognizing that individuals maintain heightened nervous system arousal by responding to stressors in one of six particular psycho-physiological patterns. Each of these patterns, interestingly, corresponds to a group of mind-body techniques. To obtain optimal improvement, selecting the mind-body strategy that best matches the self-stressed target is imperative. This does not suggest that only one mind-body approach alone should be reserved for one particular stressed response target. Instead, patterns can be considered guidepost to navigate the field of mind-body practices.

This workshop will introduce 6 self-stress psycho-physiological patterns (posture, muscles, breathing, body focus, emotions, and attention) and how to identify them. Next the corresponding mind-body medicine techniques will be examined and experienced. The mind-body modalities covered will include: 1) movement/therapeutic exercise/yoga, 2) progressive muscle relaxation, 3) breathwork, 4) autogenic training, 5) guided imagery/hypnosis/self-talk, and 6) mindfulness.

Seminar 3 9:00 AM-3:00 PM

EVALUATING MEASURES USING ITEM RESPONSE THEORY

Ruben Castaneda, NA

University of California, Merced, Merced, CA

Eager to roll out a research project, researchers often overlook the importance of proper measurement. Taking a measure at face value may be tempting, but improper measures may result in a low powered study at best, and reaching a completely wrong conclusion at worst. This course will introduce you to topics in IRT. I will go over the basics of measurement starting from selecting a proper model, evaluating the impact of each item and evaluating the measure as a whole. We will go over strategies for getting the most out of your measure using data in the behavioral sciences.

CORRESPONDING AUTHOR: Ruben Castaneda, NA, University of California, Merced, Merced, CA, 95340; rcastaneda2@ucmerced.edu

Seminar 5 9:00 AM-3:00 PM

THE NUTS AND BOLTS OF DEVELOPING, TESTING, & IMPLEMENTING DYADIC INTERVENTIONS FOR CANCER PATIENTS & THEIR INFORMAL CAREGIVERS

Hoda Badr, PHD[1], Erin Kent, PhD[2], Wendy Demark-Wahnefried, PhD RD[3], Betty Ferrell, PhD, MA, FAAN, FPCN[4], Karen Kayser, PhD, MSW[5], Jean-Philippe Laurenceau, Ph.D.[6], Matthew Loscalzo, LCSW[7], Julia H. Rowland, PhD[8], Tracey A. Revenson, PhD[9], Deborah A. Kashy, Ph.D.[10]

[1]Baylor College of Medicine, Houston, TX; [2]National Cancer Institute, Rockville, MD; [3]UAB, Birmingham, AL; [4]City of Hope, Duarte, CA; [5]University of Louisville, Louisville, KY; [6]University of Delaware, Newark, DE; [7]City Of Hope-National Medical Center, duarte, CA; [8]National Cancer Institute, Bethesda, MD; [9]Hunter College, New York, NY; [10]Michigan State University, East Lansing, MI

Traditional approaches for addressing health outcomes and health behaviors after the diagnosis of cancer have focused on either the patient or his/her primary caregiver (often the patient's partner or another close family member). However, cancer often exacts a heavy toll on both patients and their caregivers, as well as their relationships by challenging established communication patterns, roles, and responsibilities. Interest in the development of psychosocial and behavioral interventions that address the patient-caregiver dyad as a unit is growing. These dyadic interventions often seek to leverage the relationship between patient and caregiver to affect behavioral change or to enhance the quality of life of one or both partners. Despite growing interest in dyads as a promising focus of intervention, little guidance regarding the development and design of dyadic interventions or how to implement and disseminate them in oncology clinical care settings is currently available.

This seminar will provide attendees an opportunity to:

1. Learn about the growing field of dyadic interventions in cancer, including accomplishments and remaining research/practice knowledge gaps, theoretical models, and therapeutic approaches;
2. Examine appropriate study designs for different phases of the intervention development and testing process (e.g., qualitative research, dose-finding studies, pilot studies, RCTs, and effectiveness-implementation hybrid designs) as well as approaches for analyzing dyadic data;
3. Identify methodological challenges involved in dyadic research (e.g., recruitment/retention issues, choice of control group, tailoring for the individual vs dyad);
4. Discuss challenges related to clinical uptake/implementation;

5. Apply knowledge gained about relevant approaches and methodologies to their own research questions.

The format will include didactic presentations from NIH and extramural researchers, question and answer sessions, and small group activities/discussions in which participants will be provided with advice to help them in designing their own dyadic intervention project. Throughout the workshop, the emphasis will be on designing programs with an eye toward implementation. Toward that end, presenters will describe their own experiences in developing, testing, and implementing different types of dyadic interventions, bringing these “lessons learned” to bear in advising seminar attendees on their individual projects. In addition, experiential and small-group activities will deepen participants’ knowledge and skills needed for designing dyadic interventions, allowing time for tailored advice and feedback from both the presenters and the group. Funding opportunities will also be discussed.

CORRESPONDING AUTHOR: Hoda Badr, PHD, Baylor College of Medicine, Houston, TX, 77021; hoda.badr@bcm.edu

Seminar 6 9:00 AM-11:45 AM

THE FOUNDATIONS OF IMPLEMENTATION SCIENCE: TOPICS, OUTCOMES, AND METHODS

Paul A. Estabrooks, PhD[1], Samantha Harden, PhD[2], Mark Stoutenberg, PhD, MSPH[3]

[1]University of Nebraska Medical Center, Omaha, NE; [2]Virginia Tech, Blacksburg, VA;
[3]University of Miami, Miami Beach, FL

Implementation science is generally defined as the study of methods to promote the integration of research findings and evidence-based interventions within healthcare policy and practice—though the methods and scientific contributions for implementation science can also be generated in community and other organizational contexts outside of healthcare systems. The National Institutes of Health Dissemination and Implementation Research in Health program announcement describes research objectives that include supporting innovative approaches to identify, understand, and overcome barriers to the adoption, adaptation, integration, scale-up and sustainability of evidence-based interventions, tools, policies, and guidelines. Unfortunately, scientists that focus on implementation research are confronted by the challenge of identifying epistemological approaches, developing research methods that balance internal and external validity in their work, and attempting to speed the translation of evidence into clinical and community practice settings. The purpose of this workshop will be to review implementation science theories, research methods, and outcomes and provide opportunities to apply these concepts to an ongoing program of research. Specifically, Dr. Mark Stoutenberg will provide an overview of implementation science definitions and concepts from the perspective of addressing the health of underserved populations in Miami. He will also review the Consolidated Framework for Implementation Research and highlight advances in measurement and tools to assess implementation initiation and sustainability. Dr. Samantha Harden will present on implementation science outcomes, including a focus on the RE-AIM framework and applications for physical activity promotion. In addition, she will focus on pragmatic measurement of implementation outcomes as they relate to adaptation over time. Dr. Paul Estabrooks will provide examples of hybrid effectiveness implementation designs developed to reduce the delay between the identification of efficacious clinical approaches and translation into typical practice. He will provide examples of HEI designs that blend effectiveness and implementation research into three distinct, but overlapping trial types. This blending may lead to confusion in that often there may be 2 distinct levels of scientific manipulation—one, at the level of the patient or participant that is intended to change a behavioral or health outcome and one at the level of the practitioner that is intended to improve the implementation quality of the clinical practice. Finally, Drs. Stoutenberg, Estabrooks, and Harden will lead workshop participants through key considerations in developing an implementation science grant proposal using sound theory, methods, and outcomes.

CORRESPONDING AUTHOR: Paul A. Estabrooks, PhD, University of Nebraska Medical Center, Omaha, NE, 68198-4365; paul.estabrooks@unmc.edu

Seminar 7 9:00 AM-11:45 AM

WHAT YOU NEED TO KNOW ABOUT WRITING GRANTS: TIPS AND TECHNIQUES FROM EXPERTS

Lara Traeger, PhD[1], Felicity Harper, PhD[2], Jamilia Sly, Ph.D.[3], Qian Lu, Ph.D.[4]

[1]Massachusetts General Hospital/Harvard Medical School, Boston, MA; [2]Karmanos Cancer Institute/Wayne State University, Detroit, MI; [3]Icahn School of Medicine at Mount Sinai, New York, NY; [4]University of Houston, Houston, TX

This session focuses on how to integrate successful grantsmanship strategies into your career. First, a panel of experts in cancer and ethnic minority & multicultural health research will address key tips for developing grant proposals, with specific attention to NIH R03s, R21s, R01s and similar mechanisms. Then, we will demonstrate a study section review for two previously-selected proposals. Finally, we will host three roundtables on 1) balancing grant writing with other work demands, 2) interpreting grant critiques: when to keep trying and when start fresh, and 3) lessons learned: rookie mistakes and strategies for success. Attendees will be able to discuss their questions with diverse clinical research experts; observe the study section process; gain insight into research career considerations; and participate in the roundtables.

CORRESPONDING AUTHOR: Lara Traeger, PhD, Massachusetts General Hospital/Harvard Medical School, Boston, MA, 02114; ltraeger@mgh.harvard.edu

Seminar 9 9:00 AM-11:45 AM

THE NEW ACCEPTANCE AND COMMITMENT THERAPY APPROACH FOR CHRONIC PAIN AND HEADACHE

Maria Karekla, Ph.D.

University of Cyprus, Nicosia, Nicosia, Cyprus

The application of Acceptance and Commitment Therapy (ACT) for the treatment of chronic pain is well established and indeed ACT is considered an empirically supported treatment for such chronic and debilitating problems. This workshop will present the latest developments in ACT manuals for the treatment of chronic pain and headache for increasing well-being of sufferers. The latest application of these new protocols will be discussed based on findings from the European Union funded research project “ALGEA” (the Greek word for suffering). The main aim of the project was to examine the efficacy of ACT for the treatment of chronic pain and examine the mechanisms and processes of change in this approach. Concepts will be illustrated using live demonstrations, experiential exercises, metaphors, and worksheets. This workshop is designed to teach skills needed to explore ACT as an assessment model and intervention method for chronic pain. It will be mostly experiential and will balance an understanding of the model with a personal connection with the issues raised in ACT, and with skill development.

CORRESPONDING AUTHOR: Maria Karekla, Ph.D., University of Cyprus, Nicosia, Nicosia, 1678; mkarekla@ucy.ac.cy

Seminar 10 9:00 AM-11:45 AM

HARD TO MAINTAIN BEHAVIOR CHANGE: AN INTRODUCTION TO CEOS THEORY

Ron Borland, PhD

Cancer Council Victoria, Melbourne, Victoria, Australia

This seminar provides a brief introduction to CEOS theory, with a focus on how it reconceptualises a range of challenging issues within behavioral medicine. The theory is elaborated in Borland, Understanding Hard to Maintain Behaviour Change: A Dual Process Approach. Oxford, Wiley-Blackwell. 2014). Behaviour is theorised to be the result of the moment by moment interaction between internal needs (operational processes) in relation to environmental conditions, and for humans this is augmented by goal-directed, executive action which can overcome immediate contingencies to create net affective force for action which is the end pathway to action. This conceptualisation postulates a key role for emotions as signals to executive processes about internal states and relationships with the context. Affective force can come from memories of direct experience, vicarious experience, emotionally-charged communications mediated through stories the person generates and are available to them at the point of action. Executive behaviour, ie, goal seeking, can only occur when the operational processes have been activated to support it, and this requires overcoming any competing action tendencies. This seminar outlines the key postulates of the theory, then shows via examples taken from the authors 30 years of experience in tobacco control, how the theory helps make sense and provide new insights around how to communicate most effectively, and how to facilitate self-regulatory processes, which it conceives as much more than self-control. It also will show how the theory provides a framework for understanding the contributions and limitations of virtually all existing behaviour change techniques. It is hoped attendees will come away with a heightened understanding of the potential of dual process approaches to behaviour and behaviour change and new insights into their areas of practice and research.

Seminar 11 9:00 AM-11:45 AM

DYNAMIC SYSTEMS MODELING FOR HEALTH IN A SOCIAL CONTEXT

Jonathan E. Butner, Ph.D., Cynthia Berg, Ph.D.

University of Utah, Salt Lake City, UT

Real-time, daily diary, longitudinal methodologies to health research have generated a boon of data through time. For example, intensive measurement has been applied to health behaviors broadly (e.g., healthy eating, exercise, smoking) and for managing chronic illnesses (adherence, coping). Such data are complicated to analyze in a coherent, theory-driven manner. This seminar examines dynamical systems modeling with the goal of preparing participants to apply these techniques in their own research.

Attractor dynamics depict health data over time as a function of temporal patterning within a larger system. For example, many individuals with a chronic illness coordinate multiple behaviors numerous times in a day to promote adherence. Such behaviors occur within multiple social relationships (parents, friends, spouses) that can support or interfere with adherence behaviors. Dynamic systems models capture how these elements may be coordinated to either maintain homeostasis or create changes in how health behaviors are regulated.

Dynamic systems modeling captures the patterning among these elements of the system. The simplest of these patterns is a homeostatic one, where stability is examined as to how quickly the system returns to homeostasis after being perturbed. This simple representation can be captured within regression for a single time series, and multilevel modeling for multiple time series, by treating change in a variable as the dependent variable and the current value of the variable as the predictor.

Moving from a single outcome in time to two simultaneous outcomes expands homeostasis to include cyclical patternings. Such is the case when we examine the relationship of two behaviors (e.g., adherence and support of a close relationship). Analytically, this takes the regression and multilevel models and expands them to a form of the actor-partner model.

Some discussion will be provided of further expansions including continuous time model equivalents, models where there are more than one underlying temporal pattern (e.g. two different homoeostatic points, moving between them), and more complex patterning. Examples and code will be illustrated in SPSS and R.

The advantage of these models is that they can identify factors that may drive change toward better or worse health behaviors and capture the dynamic nature of these behaviors within the social context.

Seminar 13 12:15 PM-3:00 PM

ADVERSE CHILDHOOD EXPERIENCES AND ADULT HEALTH OUTCOMES: EPIGENETICS, PSYCHONEUROIMMUNOLOGY, AND BRAIN-BASED THERAPY

John B. Arden, PhD, ABPP

Institute of Brain Potential, Sebastopol, CA

The Adverse Childhood Experiences (ACEs) seminar presents a wide variety of factors having multidirectional causal relationships between ACEs: resulting in stress, depression, anxiety, the immune system, and gene expression. The interaction between all these factors has been by illuminated by studies examining ACEs and the effects of life style factors on the incidence of health and psychological problems. There are significant relationships between immune system function, stress, insecure attachment, anxiety, depression, poor nutrition, bad quality sleep, physical inactivity, and neurophysiological dysregulation. For example, insecure attachment, deprivation, and child abuse contribute to anxiety and depression in far more extensive ways then was believed. Some of these dysregulating effects includes the epigenetic down regulation of the cortisol receptors, the stress induced activation of the sympathetic nervous system, and the breakdown of the neuroendocrine system. The excessive release of cortisol can result in the eventual development of hypocortisolism with the simultaneous excessive levels of epinephrine and norepinephrine which in turn, stimulate the release of proteins called pro-inflammatory cytokines. Chronically high levels of these cytokines adversely affect the central nervous system, resulting in autoimmune diseases, as well as physiological symptoms including lethargy, achiness, and disturbances in mood, cognition, and promoting withdrawal behaviors that contribute to major depression and anxiety. This seminar will address recovery from all these problems.

Seminar 14 3:15 PM-6:00 PM

APPLICATION OF BEHAVIOR CHANGE PRINCIPLES IN APP-BASED, MOBILE HEALTH INTERVENTIONS

Kirstin Aschbacher, Ph.D. & Licensed Psychologist

UCSF/ Jawbone, San Francisco, CA

This seminar will introduce you to the skills needed to translate empirically supported behavior change techniques to a mobile health, or App-based setting. You will learn through concrete examples of how lifestyle & weight loss interventions have been designed, deployed, and tested in the context of a major Silicon Valley company's App and wearables.

The facilitator holds experience as a licensed Clinical Psychologist, an Assistant Professor at University of California, San Francisco (UCSF), and a Behavioral Data Scientist employed with a major Silicon Valley company. This seminar will discuss the challenges of deploying interventions in an integrated system, which includes an App and a tracking band, united by machine learning algorithms. Key objectives of the system are to provide users with personalized behavior change strategies.

The seminar will be geared so as to benefit both trainees and established investigators. The facilitator will discuss specific examples of how he/she developed and implemented longitudinal weight loss interventions in an industry setting. These examples will provide you with *content knowledge*, including: 1) Tips for translating behavior change principles to App settings, 2) Best practices in experimental design for A/B tests (or App-based randomized controlled trials (RCTs)), and 3) Key considerations in the analysis of your results: The pros and cons of machine learning versus traditional statistical techniques. You will also gain *process knowledge*, including: 1) What to focus on when pitching collaborations with industry, 2) How scale changes everything, and 3) Using a "Minimum Viable Product (MVP)" orientation to rapidly scale mini-interventions to larger interventions. Finally, attendees will obtain an overview of the terminology and concepts needed to bridge the gap and develop productive collaborations between academia and industry.

CORRESPONDING AUTHOR: Kirstin Aschbacher, Ph.D. & Licensed Psychologist, UCSF/ Jawbone, San Francisco, CA, 94117; kirstin.aschbacher@ucsf.edu

Seminar 15 3:15 PM-6:00 PM

PUTTING PATIENT DATA INTO ACTION: THE USE OF PATIENT-GENERATED HEALTH DATA IN CLINICAL CARE AND RESEARCH

Robin R. Austin, DNP, DC, RN-BC[1], Katherine Kim, PhD, MPH, MBA [2], Ellen Beckjord, PhD, MPH[3], Bradford W. Hesse, PhD[4], Ashley Wilder Smith, PHD, MPH[5], Sherri Sheinfeld Gorin, PhD, FSBM[6], Julie A. Wright, PhD[7], Jessica Y. Breland, PhD[8], Miho Tanaka, PhD, MPH[9], Pei-Yun Sabrina Hsueh, PhD[10]

[1]University of Minnesota, School of Nursing, Minneapolis, MN; [2]UC Davis, Sacramento, CA; [3]UPMC Health Plan, Pittsburgh, PA; [4]National Cancer Institute, Rockville, MD; [5]National Cancer Institute, Bethesda, MD; [6]New York Physicians Against Cancer, http://nypac.center/, New York, NY; [7]UMass Boston, Boston, MA; [8]VA Palo Alto & Stanford University School of Medicine, Menlo Park, CA; [9]Department of Veterans Affairs, Falls Church, VA; [10]IBM - Thomas J. Watson Research Center, Yorktown Heights, NY

Patient generated health data (PGHD), produced either directly through patient reported outcome tools or indirectly through passive sensing devices, has become an important behavioral consideration in healthcare. According to the Department of Health and Human Services, PGHD can provide information about how patients are doing between clinical visits; it can be gathered on an ongoing, longitudinal basis; it can provide relevant information for preventive and chronic care management; and it can improve patient safety through ongoing monitoring of adverse events during treatment. PGHDs are increasing in recognition and usage across health systems. The focus of this preconference is designed to inform, educate, and update colleagues on PGHD used for behavior medicine research. We will present the current state-of-the-science and related evidence for PGHD. This preconference will explore three areas: (1) presentations from individuals currently working with PGHD for research; (2) presentations from individuals currently working to implement PGHD within clinical settings and systems for use by providers and clinicians; and (3) discussions (in small groups, led by the presenters) about the potential barriers to implementing the use of PGHD and about innovative solutions to these PGHD barriers. Participants will also be able to work in small groups to develop strategies for implementing and using PGHD in their own healthcare settings. Through this workshop, participants will be able to engage in deeper discussion and dialogue with leaders in the field as well as fellow participants related to best practices and barriers to the use of PGHD in research, clinical care, and policy.

Goals/Objectives for the Pre-conference:

- Understand the use and current state of patient generated health data
- Describe current trends and opportunities for research using patient generated health data
- Identify best practices in and potential barriers to the use of patient generated health data.

CORRESPONDING AUTHOR: Robin R. Austin, DNP, DC, RN-BC, University of Minnesota, School of Nursing, Minneapolis, MN, 55455; quis0026@umn.edu

Seminar 16 3:15 PM-6:00 PM

HOW CAN SOCIAL NETWORK ANALYSIS HELP ME UNDERSTAND THE INFLUENCE THAT THE FAMILY ENVIRONMENT HAS ON INDIVIDUAL HEALTH BEHAVIORS?

Enrique Ortega, PhD / MPH[1], Emily Coviello, B.S.[2], Karen Carranza, BS[3]

[1]CSU Dominguez Hills, Alhambra, CA; [2]California State University Dominguez Hills, Alhambra, CA; [3]California State University Dominguez Hills, Lawndale, CA

Research in the health sciences has traditionally focused on assessing individual attributes to understand and predict individual health outcomes. Social Network Analysis (SNA) methods allow investigators to inquire how such individual attributes develop and become normative by considering the individual within a social context. This seminar will discuss and demonstrate how to apply SNA assessment methods to the field of family dynamics in order to investigate the potential effects that family social relationships may have on individual health decision making processes, and the evolvement of individual health practices.

SNA involves the study of how individuals monitor their social networks and make use of the information presented within these networks to modify, among other aspects, their health attitudes and behaviors. SNA research conceptualizes the individual's environment as a network to understand the reference points that an individual faces in their daily lives. SNA research allows researchers to describe the patterns of interactions that an individual perceives within their social network and to investigate how these interactions may affect their health choices. These research domains are important for investigators interested in assessing group health factors and outcomes such as those possibly tied to community and public health efforts. Social network analyses investigations are currently benefiting from advances in computer science and graphing technologies that allow researchers to visually depict the social networks of individuals and how networks influence individual conditions. While such visual depictions are at the forefront of other fields such as geography and biology, applications to the field of behavioral health can allow social health scientists to further understand the links between individual health and its link with group health patterns.

The present seminar will discuss SNA methods of assessment to understand how individuals perceive and cognitively represent the family networks that surround them; and how these perceptions inform their individual health knowledge and behaviors. The application of SNA methods will be discussed and demonstrated through 3 case studies which have utilized such methods to inquire how family network dynamics inform the development of health promotion practices, emotional regulation, and healthy lifestyle choices.

Seminar 17 3:15 PM-6:00 PM

VARIANCE MODELING OF ECOLOGICAL MOMENTARY ASSESSMENT (EMA) DATA

Donald Hedeker, Ph.D.

University of Chicago, Chicago, IL

For longitudinal data, mixed models include random subject effects to indicate how subjects influence their responses over the repeated assessments. The error variance and the variance of the random effects are usually considered to be homogeneous. These variance terms characterize the within-subjects (error variance) and between-subjects (random-effects variance) variation in the data. In studies using Ecological Momentary Assessment (EMA), up to thirty or forty observations are often obtained for each subject, and interest frequently centers around changes in the variances, both within- and between-subjects. Also, such EMA studies often include several waves of data collection. In this seminar, we focus on an adolescent smoking study using EMA at both one and several measurement waves, where interest is on characterizing changes in mood variation associated with smoking. We describe how covariates can influence the mood variances, and also describe an extension of the standard mixed model by adding a subject-level random effect to the within-subject variance specification. This permits subjects to have influence on the mean, or location, and variability, or (square of the) scale, of their mood responses. Additionally, we allow the location and scale random effects to be correlated. These mixed-effects location scale models have useful applications in many research areas where interest centers on the joint modeling of the mean and variance structure. Computer application using SAS NLMIXED and the freeware MIXREGLS program will be described and illustrated.

60 MINUTES FOR HEALTH: PILOTING AN INNOVATIVE BEHAVIORAL INTERVENTION PROMOTING RETENTION IN HIV CARE

Laramie R. Smith, PhD[1], K. Rivet Amico, PhD[2], Chinazo Cunningham, MD, MS[3]

[1]Division of Global Public Health/UCSD, La Jolla, CA; [2]School of Public Health/ University of Michigan, Ann Arbor, Ann Arbor, MI; [3]Albert Einstein College of Medicine, Bronx, NY

Sustained retention in HIV medical care is a key health behavior for the long-term health of people living with HIV (PLWH) and reduced HIV transmission via viral suppression. In the US, the CDC estimates 60% of PLWH are not retained in HIV care, yet to date, the few evidence-based retention-promoting interventions available are resource and time intensive to implement. The current study piloted *60 Minutes for Health*, a theory-based, low-resource single-session intervention designed to be implemented in a busy clinic setting by a health educator, to PLWH who have had a recent (≥6-months) gap in care. Intervention content was informed by the Information Motivation Behavioral Skills model and delivered via Motivational Interviewing. A series of guided activities aimed to identify and reduce faulty heuristics guiding HIV care attendance, enhance motivation to maintain care via personal health goals, and build skills for coping with negative affect towards living with HIV and increase self-efficacy for navigating the logistics of maintaining care amidst competing priorities. Participants were randomized to *60 Minutes for Health* (n=8) or a theory-based, diet and nutrition time-and-attention control intervention (n=8). Medical records were abstracted to measure number of quarters (3-month intervals) with an HIV care visit, and group differences in visit attendance over time were characterized and evaluated with independent group t-tests. Groups did not differ in the number of quarters with a visit 12-months prior to baseline ($t_{(14)=}0.894$, $p_{(2\text{-tail})=}0.386$). A substantial trend identified 75% of the retention arm vs. 50% of the control arm had at least one visit in the first two quarters ($t_{(14)}=0.149$, $p_{(1\text{-tail})}=0.167$). Over the entire 12-month follow-up, retention intervention participants had dramatically more quarters with documented care visits (M=2.75, SD=1.28) than those in the comparison condition (M=1.38, SD=1.60), which did reach significance ($t_{(14)}=1.898$, $p_{(1\text{-tail})}=0.039$; Cohen's d=0.946). Findings suggest the *60 Minutes for Health* intervention may promote better adherence to HIV care among PLWH with a history of poor retention.

Health coaching can promote health behavior change in contexts including health insurance plans, workplace wellness programs, and primary care clinics. Online coaching programs may offer additional flexibility for patients who need it. Little is known, however, about people's preferences for health coach terminology or the characteristics and services they expect from coaching. This formative study was conducted to inform the design of an online health coaching program. We interviewed 25 adults enrolled in employer-sponsored health insurance plans (mean age = 42, age range 28-63; 68% women; 76% white). A semi-structured interview was conducted to explore associations with, and preferences for, health coaching terminology. Card sort exercises elicited reactions to 31 coaching terms (e.g., navigator, guide). Participants also answered open-ended questions about coaching. Interviews were transcribed and coded by two trained coders. Preferred terms for people assisting with behavior change included coach, advisor, counselor, specialist, and consultant. One dimension that differentiated terms was education/training (expert) vs. life experience (supporter). Most participants expected coaches to have extensive experience, but none believed a coach had to have lived through the same experience as the person being coached. Many participants believed coaches are successful in motivating health behavior change when they hold people accountable to their goals. Participants valued coaches' empathy, listening skills, and ability to motivate. Most participants did not anticipate negative consequences of working with coaches, but a few expressed reservations about data security, poor advice, or too-frequent contact. Results suggest that some coaching terms are more strongly endorsed than others, and that people generally have positive expectations of coaching. Future research will compare this sample with Medicaid-insured individuals to explore whether and how

preferences differ. Online coaching programs should reflect participants' preferences for coaching terms and attributes of coaches, and find ways to reassure participants about perceived negative effects of coaching.

A NOVEL MODEL TO SUPPORT LIFESTYLE INTERVENTIONS IN CANCER SURVIVORS: UNDERGRADUATE STUDENTS AND MULTIMODAL SOFTWARE PLATFORM

Angela Yung, RDN[1], Tracy Crane, BS: MS; PhD[2], Amanda Younger, MS, CE-P, CHWC, EIM[2], Loescher J. Lois, PhD, FAAN[3], Lindsay Bingham, B.S.[4], Cynthia Thomson, PhD, RD[2]

[1]Behavioral Measurement and Interventions Shared Resourc, Tucson, AZ; [2]University of Arizona, Tucson, AZ; [3]The University of Arizona, Tucson, AZ; [4]Arizona Smokers' Helpline, Tucson, AZ

Background: There are an estimated 15.5 million cancer survivors in the U.S. Lifestyle interventions that promote healthy eating and physical activity hold promise to improve survival and quality of life. Efforts to test and develop scalable, cost-efficient models for the delivery of lifestyle behavior interventions is an active area of research.

Purpose: To describe the integration of a health coaching training program developed for undergraduate (UG) students and its effect on cancer survivors.

Methods: The University of Arizona Behavioral Measurements and Interventions Shared Resource (BMISR) at the University of Arizona (UA) Cancer Center in collaboration with Arizona Research Labs developed a cloud-based software platform for the delivery of eHealth coaching (telephone, SMS, email) for lifestyle intervention research. A 120 hour standardized health coaching training program was developed for UG students in nutrition science and public health for the delivery of lifestyle interventions. Training for health coaches is grounded in cognitive behavior theory with integration of the health belief model utilizing motivational interviewing to guide behavior change. In addition, health coaches are trained in nutrition and physical activity areas specific to cancer survivors including GI health, neuropathy, and fatigue.

Results: Since 2012, over 900 patients (predominantly cancer survivors) have received health coaching from 20 trained UG health coaches at BMISR. Evidence for behavior change within one cohort of survivors, when comparing baseline to 12 month data suggests average increase in 5.2 MET-hour /week, reduction in dietary fat of 14 grams/day as well as increases of 3 servings/day in vegetable/fruit and 8.5 grams fiber. UG students trained utilizing this model have been highly successful in achieving professional goals with 5 securing dietetic internships and 4 entering graduate training programs. Importantly, this model for intervention delivery is cost-effective, with each coaching session costing less than $12.00.

Conclusion: Novel, student-engaged approaches that integrate resources and expertise across academic campuses can result in the provision of lifestyle interventions that are mutually beneficial for patient populations, researchers and students.

A PILOT STUDY TO EVALUATE A HEALTHY LIFESTYLE BEHAVIOR CHANGE PROGRAM

Linda Gotthelf, Ph.D.[1], Carol Addy, M.D., MMSc[2], Steven May, PHD Licensed Psychologist California[3]

[1]HMR, Boston, MA; [2]HMR Weight Management Services Corp., Boston, MA; [3]Health Management Resources, Palm Springs, CA

Data consistently show that few Americans are physically active and follow a healthy diet even though these behaviors have been shown to be associated with maintaining normal body weight, reduced risk of chronic diseases, and overall health. It is important to identify programs to help people be engaged in and reinforced for making healthy lifestyle changes.

HMR, with over 30 years of experience in weight management, conducted a 12-week pilot study to evaluate the effect of a novel healthy lifestyle behavior change program on health and quality of life. A lifestyle survey was developed to create a Healthy Eating & Physical Activity Profile. Individual profiles had activity and healthy diet scores as well as a total Healthy Lifestyle Score (HLS). The lifestyle survey was completed at baseline, weeks 4, 8 and 12. Quality of life (QoL) was evaluated at baseline and week 12 using the RAND 36-item Health Survey. The primary endpoint for the study was change from baseline in HLS, an indication of change in measured healthy lifestyle behaviors.

Participants kept simple records on physical activity (PA) and vegetable/fruit servings (V/F) each day using an HMR mobile app. Participants who expressed interest in weight loss (98%) were sent a wireless scale and were instructed to weigh weekly. Hour-long weekly group coaching sessions were conducted over the phone by trained health coaches.

62 participants enrolled (56 women, 6 men) with a mean starting weight of 218.3 lbs. (range: 149-364). 93.5% completed the 12 week pilot. Preliminary data (n=50) show a mean of 1054 and 2636 PA calories/wk and 9.9 and 34.3 V/F servings (full-cup) at baseline and at week 12, respectively. The total HLS score was 50.1 at baseline and 92.0 on the post-survey (range of possible scores is 0-120). The mean weight change was 8.2 lbs. On the post-study survey, 96.5% felt somewhat or very much more optimistic about their overall health and QoL and 94.6% were more optimistic about managing their weight. 91% said they would recommend the program to family, friends or colleagues. On the RAND Survey, all 8 scales improved from baseline with the greatest improvement in role capabilities due to physical health and energy.

Overall, participants were able to use the HLS as a tool to identify specific steps in making lifestyle changes. Despite modest weight loss, participants made dietary and PA changes and the improvement in QoL was substantial for most.

A THEORY-BASED SMART PHONE APP TO PROMOTE SAFETY BEHAVIORS

Andrea Gielen, ScD ScM

Johns Hopkins Bloomberg School of Public Health, Baltimore, MD

BackgroundThe leading cause of death to children after the age of 1 is motor vehicle crashes, and child safety seats (CSS) are known to reduce this risk by between 50-80%. Parents' use of CSS with their older children (> 4years) is low, and misuse is widespread. Health care settings offer an ideal time to communicate with parents, yet there are many missed opportunities to do so, especially in emergency departments (EDs) where clinicians' time is very limited. Therefore we developed a theory-based, stand-alone, smart phone app to promote correct CSS use that does not rely on clinicians to communicate potentially life-saving information. We tested the efficacy of the app in an RCT conducted in a pediatric ED in Maryland and one in Arkansas

Methods Parents with children 4-7 years old were recruited in the ED waiting rooms where they downloaded the Safety in Seconds app to their smart phone, and completed a baseline assessment of behavior and beliefs. Based on their responses, a personalized feedback report with tailored education was immediately delivered in the app. Those randomized to the intervention group received CSS messages; those in the control group received fire safety messages. The assessment and messages were developed following the Precaution Adoption Process Model. Development of the app and the application of behavioral theory to messaging will be further described in the presentation. A follow-up survey was conducted 3 months later.**Results**A total of 707 parents completed follow-up, and there were no demographic differences between the two study groups. Compared to the control group, the intervention group was significantly more likely to report using the correct type of car seat for their child's age and size (77% vs. 68%; $p < 0.01$), more likely to report their child rides in the back seat (96% vs. 91%; $p < 0.01$), and more likely to report having had their seat inspected by a car seat technician (41% vs. 20%; $p < 0.01$). Significant results were maintained when adjusted for behaviors reported at baseline. **Conclusions** A theory-based, tailored educational program delivered via smartphone app can improve parents' use of car safety seats to protect their children.

AN ONLINE DAILY FEEDBACK INTERVENTION IMPROVES SUN PROTECTION AMONG PATIENTS WITH AN ELEVATED RISK OF SKIN CANCER

Tammy Stump, PhD[1], Lisa G. Aspinwall, PhD[2]

[1]Feinberg School of Medicine, Northwestern University, Chicago, IL; [2]University of Utah, Salt Lake City, UT

Every year, over two million people are diagnosed with skin cancer. The primary method recommended for skin cancer prevention is reducing ultraviolet radiation (UVR) exposure. However, sun protection is often inadequate, even among higher risk patients. To assist patients' efforts to reduce their skin cancer risk, the present study provided daily personalized feedback on UVR exposure.

This study tested 1) the effectiveness of a 14-day online intervention that provided daily color-coded feedback illustrating duration of UVR exposure on specific body sites, and 2) theoretically derived predictions on how feedback impacts the process of reducing UVR exposure. Participants (*N*=47; 53.3% women, mean age=49.87) were recruited from dermatology clinics and had an elevated risk of skin cancer; most (63.8%) had a skin cancer history, including 44.7% with melanoma. Participants were randomly assigned to a feedback, self-monitoring, or control condition. For feedback participants, the 14-day intervention included daily sun-protection reminders, self-reports of sun exposure, color-coded feedback diagrams, and survey items on health-relevant cognitions and emotions. To control for the potential benefit of reporting one's behavior, self-monitoring participants completed these assessments but did not receive feedback. Control participants only received daily reminders.

At baseline, then 1 and 2 months later (and during the intervention, if applicable), sun exposure was measured by the Minutes of Unprotected Sun Exposure (MUSE) Inventory, which assesses the duration of sun exposure after accounting for the use of any sun protection methods (e.g., sunscreen, hat). During the intervention, feedback participants reported less sun exposure than self-monitoring participants. In both of these conditions, participants reported higher perceptions of goal fulfillment for sun exposure on intervention days when their sun exposure was lower, and these perceptions predicted higher self-efficacy for sun protection. Only feedback participants reported a decrease in sun exposure from baseline to the 2-month follow-up; significant decreases were reported for the lower face, arms, and lower legs, which are common sites for melanoma. Tanning was also assessed by reflectance spectroscopy, an objective measure of skin color. These measurements did not change over time or by condition, potentially because they were taken on a limited number of

body sites (wrist, upper face) for which reported exposure did not decrease substantially.

This study supports the feasibility and effectiveness of an online, daily feedback intervention for sun exposure among higher risk patients. Future directions include testing it among other populations and investigating additional mechanisms (e.g., changes in goals) through which feedback operates.

ASSESSING THE THEORETICAL FIDELITY OF BEHAVIOR CHANGE INTERVENTIONS USING TAXONOMY CODING

Shirley M. Moore, PhD[1], Clara Adegbite-Adeniyi, BA[1], Oluwatomisin Olayinka, MPH, RN[2]

[1]Case Western Reserve University, Cleveland, OH; [2]School of Nursing, Case Western Reserve University, Cleveland, OH

Background: In studies of head-to-head comparisons of theoretically-different behavior change interventions it is important to have good theoretical fidelity of the interventions designed and tested. The development of a taxonomy coding system for 93 behavior change techniques (Michie, 2013) provides a standardized approach to determining the types and dose of behavior change techniques used in interventions.

Purpose: **The purpose of this report is to** describe the use of taxonomy coding to assess the theoretical fidelity of behavior change interventions currently being tested in a randomized trial for weight management in adolescents. One intervention was based on cognitive-behavioral theory, the other intervention was based on system process improvement theory.

Methods: Following training in the coding process and the establishment of acceptable interrater reliability, the Behavior Change Technique Taxonomy (BCTTv1) was used by two coders to independently code intervention materials (teaching plans, handouts) of two 12-month family-focused interventions for adolescent weight management (25 90-minute face-to-face sessions each).

Results: Findings showed that there were distinct differences in the types of behavior change techniques used in the two interventions. The cognitive behavioral intervention predominately used behavior change techniques associated with goal setting and problem-solving, whereas these techniques were negligibly used in the system process improvement intervention. Alternatively, the use of behavioral experiment, behavioral instruction, behavioral practice, behavioral contract, and commitment were used to a much greater extent in the system process improvement intervention. Thus, the behavior change techniques used in the two interventions did reflect the different theoretical foundations of the interventions.

Conclusions: In conclusion, the use of a behavior change technique taxonomy was useful to assess the extent to which intervention components reflected the underlying theories of different interventions. Greater application of intervention taxonomy coding has the potential to assist behavioral scientists to design more efficient and effective behavior change interventions.

ASSOCIATION BETWEEN SPIRITUALITY AND INTERVENTION ADHERENCE IN A MIND-BODY PILOT STUDY AMONG AFRICAN AMERICANS

Nishat Bhuiyan, B.S.[1], Scherezade K. Mama, DrPH[2], Jornae Rideaux, MPH[3], Lorna McNeill, PhD, MPH[4]

[1]The Pennsylvania State University, State College, PA; [2]The Pennsylvania State University, University Park, PA; [3]MD Anderson Cancer Center, Pearland, TX; [4]University of Texas MD Anderson Cancer Center, Houston, TX

Mind-body (MB) practices have been shown to be effective for improving various health outcomes. Spirituality is an important cultural component in the African American community, and culturally-adapted MB interventions have potential for reducing health disparities. However, little is known about the role of spirituality in MB intervention adherence. A mixed-method approach was used to examine the association between spirituality and intervention adherence in an MB pilot study among African American churchgoers. Participants were recruited through an existing church partnership, and eligible participants (*N*=50) were randomized to an MB intervention (*n*=26) or wait-list control (*n*=24) group. Participants in the MB intervention (*M* age=50.1 years, *M* BMI=33.9 kg/m^2) attended 16 MB sessions over 8 weeks. Spirituality was assessed at baseline (T1) and post-intervention (T2) with the Functional Assessment of Chronic Illness Therapy Spiritual Wellbeing Scale (FACIT-Sp). A subsample of MB participants (*n*=6) completed an optional in-depth exit interview consisting of questions assessing motivators and barriers to intervention attendance. Among those in the MB intervention, increases in spirituality were associated with increased session attendance (β=.697, *p*=.033). A thematic content analysis of the interview transcripts identified spirituality as a key motivator for participants' intervention attendance. Results suggest that spirituality may play an important role in intervention adherence in an African American church-based population. Church-based MB interventions should aim to incorporate and foster spirituality as a strategy to overcome barriers to intervention adherence among African Americans.

BIDIRECTIONAL LONGITUDINAL ASSOCIATIONS BETWEEN SMOKING AND AFFECT IN CANCER PATIENTS USING VARENICLINE TO QUIT SMOKING

Allison J. Carroll, M.S.[1], Anna K. Veluz-Wilkins, MA[1], Nancy C. Jao, MS[1], Frank Leone, MD MS[2], Robert A. Schnoll, PhD[2], Brian Hitsman, Ph.D.[1]

[1]Northwestern University Feinberg School of Medicine, Chicago, IL; [2]University of Pennsylvania, Philadelphia, PA

Background: During a quit attempt, low positive affect (PA) and high negative affect (NA) predict relapse to smoking. In this study we evaluated bidirectional longitudinal associations between smoking and PA/NA in cancer patients treated with varenicline. Methods: Smokers (≥5 cigarettes/week) who were diagnosed with cancer within 5 years were recruited for an ongoing 24-week trial of extended duration varenicline plus behavioral counseling. Data were drawn from the 12-week open-label phase. Smoking was assessed via self-reported number of cigarettes in the past 24 hours (CPD). PA/NA were assessed using the Positive and Negative Affect Scale. Data were collected at pre-quit (PQ), target quit day (TQD), week 4 (W4), and week 12 (W12). We evaluated cross-lagged panel models for NA and PA using PROC CALIS in SAS. We assessed autocorrelations (e.g. PQ CPD to TQD CPD) and cross-lagged associations (e.g. PQ CPD to TQD NA). Error covariances (e.g. PQ CPD and PQ PA) were included in each model. Results: Participants (N=93 with complete data) were 48% female, 33% racial minority, and 59 years old on average. Goodness-of-fit statistics were adequate for both models (NA: SRMR=0.09, AGFI=0.71, RMSEA=0.18, BCFI=0.87; PA: SRMR=0.07, AGFI=0.81, RMSEA=0.12, BCFI=0.96). Autocorrelations were strong within PA (path coefficients: 0.81-0.85) and NA (0.52-0.66), *p*spspspsConclusion: Using novel statistical methodology we found that self-reported smoking within the past 24 hours accounted for up to 22% of variance in later NA, but not PA, through 12 weeks of treatment. Neither NA nor PA predicted later smoking. Among cancer patients treated for nicotine dependence, the lack of association between PA and smoking suggests that varenicline may especially modulate PA, independent of smoking status.

BRIEF COUNSELING AND EXERCISE REFERRAL SCHEME: A PRAGMATIC TRIAL IN MEXICO.

Katia Gallegos Carrillo, PhD MSc[1], Carmen Garcia Peña, PhD MSc MD[2], Jorge Salmeron, PhD MSc MD[3], Nelly Salgado-de-Snyder, PhD, MPH[4], Felipe Lobelo, PhD MD[5]

[1]University of Southern California, Glendale, CA; [2]Instituto Nacional de Geriatria Mexico, Ciudad de Mexico, N/A, Mexico; [3]Instituto Mexicano del Seguro Social, Cuernavaca, N/A, Mexico; [4]National Institute of Public Health. Mexico., Cuernavaca, Morelos, Mexico; [5]Emory University, Atlanta, GA

Introduction: The effectiveness of clinical-community linkages for the promotion of physical activity (PA) has not been explored in low and middle-income countries (LMICs). It was assessed the effectiveness of a primary-care based, 16-week intervention rooted in behavioral theory approaches to increase compliance with aerobic PA recommendations.

Methods: Pragmatic cluster randomized trial.Patients with diagnosis (< 5 years) of hypertension, 35-70 years of age, self-reported as physically inactive, with a stated intention to engage in PA, and attending primary health care centers (PHCC) in the Social Security health system in Cuernavaca, Mexico. Out of a total of 23 PHCCs, four were selected based on proximity (5 km radius) to a center with PA programs and trained personnel and randomized to a brief PA counseling (BC) (n=2) or an exercise-referral (ER) (n=2) intervention. The study was conducted between 2011 and 2012. Change in objectively-measured PA levels (ActiGraph GT3X accelerometers) at baseline, 16 and 24 weeks. Intention-to-treat analyses were used to assess the overall effectiveness of the intervention overall and according to ER intervention attendance. Longitudinal multilevel mixed-effects analysis considering the interaction (time by intervention) were conducted, each model was also adjusted by baseline value of the outcome measure, demographic and health variables, social support, PA self-efficacy and barriers.

Results: Minutes/week of moderate-to-vigorous physical activity (MVPA) objectively-measured increased by, 40 and 53 minutes in the ER and BC groups, respectively ($p=0.59$). Participants attending> 50% of ER program sessions increased their MVPA by 104 minutes/week and their compliance with aerobic PA recommendations by 23.8%, compared to the BC group (both $p < 0.05$).

Conclusions: Both BC and ER led to modest improvements in PA levels, with no significant differences between groups. Adequate adherence with the ER program sessions led to

significant improvements in the compliance with aerobic PA recommendations compared to BC. These results provide evidence to help guide the development and implementation of programs integrating standardized PA assessment, counseling and referrals via clinical-community linkages in Mexico and other LMICs in the region.

CELL PHONE USE WHILE DRIVING: DOES PEER-REPORTED USE PREDICT EMERGING ADULT BEHAVIOR

Neha Trivedi, MPH[1], Denise Haynie, PhD, MPH[2], Joseph Bible, PhD[2], Danping Liu, PhD[2], Bruce Simons-Morton, EdD, MPH[2]

[1]University of Maryland, Adelphi, MD; [2]National Institute of Child Health and Human Development, Bethesda, MD

Secondary task engagement such as cellphone use while driving is a common public health concern among adolescents and emerging adults. Cell phone use among this population contributes to the high rates of fatal car crashes. Peer engagement in similar risky driving behaviors, such as cell phone use, could affect adolescent driving behavior. The present study investigates the association between peer and emerging adult cell phone use while driving. Binomial logistic regression analyses, adjusting for gender, race/ethnicity, parental education, and family affluence, showed that participants with peers who reported the first year after high school frequently texting while driving, were significantly more likely to text while driving the following year (odds ratio, 3.01; 95% CI, 1.19 to 7.59; P=0.05) . The findings are consistent with peer influence on the prevalence of texting while driving among emerging adult.

CHANGES IN SEDENTARY BEHAVIORS AMONG LATINAS IN A PHYSICAL ACTIVITY INTERVENTION

Sheri J. Hartman, PhD[1], Shira Dunsiger, PhD[2], Dori Pekmezi, PhD[3], Britta Larsen, PhD[4], Bess H. Marcus, Ph.D.[5]

[1]Department of Family Medicine and Public Health, UC San Diego, La Jolla, CA, USA, La Jolla, CA; [2]The Miriam Hospital and Brown University, Portsmouth, RI; [3]University of Alabama at Birmingham, Birmingham, AL; [4]University of California, San Diego, San Diego, CA; [5]University of California, San Diego, La Jolla, CA

Greater time spent in sedentary behaviors is associated with increased risk for poor health outcomes. Emerging research has demonstrated that sedentary behaviors are distinct from physical activity and that existing interventions to increased physical activity do not meaningfully impact sedentary behaviors. The purpose of this study was to examine changes to sedentary time among Spanish-speaking Latinas in a randomized controlled trial of a physical activity intervention.

Sedentary time and moderate to vigorous physical activity (MVPA) were measured via accelerometer at baseline, 6 and 12 months. Using a series of generalized linear models, we examined intervention effects on mean sedentary time at follow-up, controlling for baseline and wear time.

Participants (n=205) were a mean age of 39 years (SD=10.5) with the majority self-identified as Mexican (84.4%), White (51.7%) and First Generation (81%). Overall, participants were sedentary an average of 62.03 hours per week (SD=18.18). Results showed significant intervention effects such that those randomized to the Intervention arm had significantly higher mean minutes of objectively measured sedentary time at 6 and 12 months, p's < .05. Compared to the control group, participants in the Intervention arm were sedentary for 146 more minutes/week at 6 months and 254 minutes/week at 12 months (p=.02). As a subsequent step, we added MVPA into the model as the Intervention group had significantly greater increases in min/week of MVPA than the control group (mean differences=31.0, SE=10.7, p < .01). The Intervention group spent significantly more minutes being sedentary than the control group even after controlling for time in MVPA. Furthermore, more time spent in MVPA was positively associated with more sedentary time (p=.04).

These results emphasize that sedentary behavior and physical activity are distinct behaviors,

and suggest that, as participants increase MVPA, they may compensate by also increasing sedentary time. Physical activity interventions may need to simultaneously address decreasing sedentary time in order to maximize health benefits.

COPING STYLE AND DIABETES DISTRESS AS PREDICTORS OF HABIT STRENGTH FOR INSULIN USE AMONG ADULTS WITH TYPE 2 DIABETES

Rachel Burns, PhD[1], Sonya Deschênes, PhD[2], Bärbel Knäuper, PhD[1], Norbert Schmitz, PhD[2]

[1]McGill University, Montreal, PQ, Canada; [2]McGill University/Douglas Mental Health University Institute, Montreal, PQ, Canada

Habits are important processes for health behavior maintenance. Strong habits are automatic and are formed by repeating a behavior in a stable context. Coping styles can influence how often a behavior that is perceived to be stressful is performed and thus may influence the formation of strong habits. In particular, an avoidance-oriented coping style may hamper the formation of strong habits because behaviors that are avoided are repeated less frequently. In contrast, task-oriented styles involve problem-solving and planning and may facilitate the development of strong habits by promoting behavioral repetition. This study tested prospective associations between dispositional coping styles (avoidance-, task-, and emotion-oriented) and habit strength for insulin use. Coping strategies are activated under conditions of stress, so diabetes distress was tested as a moderator. Diabetes distress was hypothesized to moderate the association between avoidance-oriented coping and habit strength for insulin use, and the association between task-oriented coping and habit strength. The association between emotion-oriented coping and habit strength was explored. Participants were 77 adults with type 2 diabetes who were insulin-naïve at baseline and initiated insulin therapy during the 3- or 4-year follow-up waves. Coping styles and diabetes distress were measured at baseline. Habit strength for insulin use was measured at the follow-up wave that insulin use was first reported. Diabetes distress moderated the association between avoidance-oriented coping and habit strength ($p = .02$, $\Delta R^2_{interaction} = .07$); avoidance-oriented coping was inversely associated with habit strength if diabetes distress was relatively high, but not if diabetes distress was average or low. Diabetes distress also moderated the association between task-oriented coping and habit strength ($p = .0497$, $\Delta R^2_{interaction} = .05$). Contrary to expectations, task-oriented coping was inversely associated with habit strength if diabetes distress was relatively high or average, but not when diabetes distress was low. This may be attributable to the vigilance and deliberative decision-making that accompanies task-oriented coping. Emotion-oriented coping was not associated with habit strength. Results indicated that specific coping styles were prospectively associated with habit strength for insulin use if diabetes distress was relatively high. Previously, studies have generally examined if properties of the target behavior influence the development of habits. This study highlights the utility of exploring dispositional characteristics as predictors of habit formation. Future research could

explore the effectiveness of delivering simple habit formation interventions to individuals with task- or avoidance-oriented coping styles who are experiencing high levels of diabetes distress.

CORRELATES OF FLU VACCINE BEHAVIOR AND VACCINE INTENTIONS AMONG COLLEGE STUDENTS

Kara M. Magane, MS[1], Gregory M. Dominick, PhD[2]

[1]Division of Adolescent/Young Adult Medicine, Boston Children's Hospital, Portsmouth, NH;
[2]University of Delaware, Newark, DE

Background. Influenza (flu) vaccination rates are lowest among college students, yet research in this population is limited. This study examined correlates of flu vaccine behaviors and intentions, and reasons for not getting vaccinated.

Methods. An online survey was emailed to a random sample of 3,201 full-time undergraduate students between 18 and 25 years of age. Multivariate logistic regression was used to determine associations between demographic (n=5), psychosocial (n=3), and environmental (n=10) influences on past flu vaccine behaviors and flu vaccine intentions.

Results. Of the 450 respondents, 36% received a flu vaccine in the past year, and nearly 45% intended to get vaccinated for the coming season. Being Hispanic (AOR=0.36, 95%CI 0.15-0.90), having very good health (AOR=0.47; 95%CI 0.26-0.86), and using pharmacy/health department (AOR=0.55, 95%CI 0.36-0.85) or family/friends (AOR=0.53, 95%CI 0.34-0.82) as sources of flu vaccine information were associated with lower odds of receiving the flu vaccine in the past year. Belief that advertising increased one's likelihood of getting vaccinated was associated with higher odds of receiving the flu vaccine in the past year (AOR=2.18, 95%CI 1.41-3.35). Flu vaccine intentions were lower for African Americans (AOR=0.37, 95%CI 0.15-0.91) and those using Internet/social media as a source of flu vaccine information (AOR=0.38; 95%CI 0.38-0.93). Flu vaccine intentions were higher among those concerned about flu (AOR=1.97, 95%CI 1.10-3.53) and those aware of the cost and location of campus flu vaccine services (AOR=1.67, 95%CI 1.11-2.52). The most frequently reported reasons for not getting vaccinated were never getting the flu (33.73%), unlikely to get sick from the flu (32.13%), and concerns that the vaccine causes the flu (31.33%).

Discussion. Flu vaccination behaviors and vaccine intentions in this sample are below the national target of 70%. Results revealed differences in correlates of past flu vaccine behaviors and intentions that could inform campus-wide programs to promote flu vaccination rates, particularly among racial/ethnic minorities. Given that most college students are in good health, behavioral intervention messages should target perceived flu susceptibility and severity, while accurately addressing misconceptions about flu vaccine safety, as well as vaccine cost and location to reduce barriers and increase accessibility.

DEPRESSION AND ANXIETY PREDICTING RUMINATION’S IMPACT ON HEALTH BEHAVIORS: A DAILY DIARY STUDY

Kristen E. Riley, Ph.D. [1], Crystal L. Park, PhD[2], Dean Cruess, PhD[3], Jean-Philippe Laurenceau, Ph.D.[4]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]University of Connecticut, Storrs Mansfield, CT; [3]University of Connecticut, Storrs, CT; [4]University of Delaware, Newark, DE

Rumination, or thinking passively, negatively, and repetitively, is a common cognitive process, and is associated with poor health behaviors. Rumination may impact health behaviors through two distinct behavioral pathways: acting too quickly (impulsivity) or not acting at all (amotivation). Anxiety and depression may be differential predictors of the behavioral manifestations of rumination, and may be able to predict its effect on health behavior patterns. Our purpose was to test whether individuals reporting anxiety who ruminate will then act impulsively and those reporting depression who ruminate will then not act (amotivation) in the context of daily health behaviors. We recruited 285 college students (mean age=19.3; 76.8% female; 79.4% Caucasian) and had them complete a baseline survey and an 11-day online daily diary survey. Variables assessed included baseline trait depression and anxiety (DASS-21), and daily rumination (RRS), impulsivity (BIS-11), and amotivation (GMS-28), all specifically in the context of daily health behaviors, such as fruit, vegetable, and alcohol intake, exercise, and sexual risk taking behavior. Participants completed an average of 9.72 of 11 daily diary days, or 88.3% compliance. Results showed that rumination predicted health behaviors through both impulsivity and amotivation. Mediation models revealed that baseline anxiety predicted daily rumination ($\beta = .060$, p = p = .051), and that baseline depression predicted rumination ($\beta =.057$, p = p = .055). We found that 17% of the association between rumination and exercise was explained by impulsivity, and 29% of the association between depression and motivation was explained by rumination. In additional post-hoc analyses, rumination was shown to predict health behaviors above and beyond depression and anxiety, demonstrating that rumination is an important, and perhaps more proximal, predictor of health behaviors. These results showed that those who report depression or anxiety are likely to experience more daily rumination and the deleterious behavioral manifestations of that rumination, which the affects health behavior engagement or avoidance. Future behavioral health interventions can perhaps specifically target impulsivity in those reporting anxiety and amotivation in those reporting depression in order to promote healthy behaviors.

DESCRIPTIVE ASSESSMENT OF IMPLEMENTATION INTENTIONS IN A MOBILE ECOLOGICAL MOMENTARY INTERVENTION FOR SMOKING CESSATION

Vincent Puga-Aragon, MPH[1], Katherine L. Sarina, Psychology, B.A.[2], Sheila Yu, MPH[3], Christian Cerrada, BS[3], Kathleen Colao, BS, MPH[4], Eldin Dzubur, MS[3], Jimi Huh, PhD[3]

[1]MyQuit USC, Duarte, CA; [2]University of Southern California, Huntington Beach, CA; [3]University of Southern California, Los Angeles, CA; [4]University of Southern California Keck School of Medicine, Venice, CA

Introduction: The present study explores the types of implementation intentions (IIs) that young Korean smokers enact to avoid smoking lapse during a cessation attempt. Though IIs have demonstrated success in previous smoking cessation studies, assessment of the types of IIs smokers select and whether or not they have been enacted *in situ* has been rare. Mobile health applications delivering ecological momentary assessments (EMA) have enabled researchers to observe this process in real-time, allowing for exploration of II enactment, adjustment, and failure to enact during high-risk smoking situations (HRSS) associated with smoking.

Methods: Korean American emerging adult (KAEA) participants (N=16) responded to EMAs (n=1,351) following at least five self-scheduled HRSS each day over 4 weeks using “MyQuit USC”, a mobile smoking cessation app. Following each HRSS, participants indicated whether or not they completed the specific II they scheduled with each HRSS at baseline. IIs were categorized based on the primary method for avoiding lapse and HRSS were categorized by types of smoking contexts: social, emotional, and habitual. We report descriptive statistics on the most commonly enacted IIs overall and by HRSS type. Patterns of II completion over time are also summarized.

Results: II enactment was assessed using EMA during 1,351 HRSS. Among those, 712 IIs were enacted, with 71.5% completed during the initially scheduled, i.e. “congruent”, HRSS. The distraction/substitution methods (e.g., chew gum) were the most commonly enacted IIs, accounting for 41.5% of the total IIs completed across all congruent HRSS types. Among the original IIs that were not followed, 67.3% were replaced with an alternate method, with 37% of them being performed during the congruent HRSS. The averaged proportion of overall II completion across participants increased over the 4 weeks from 48.3% to 59.4%. IIs in congruent HRSS had an increase in completion proportion from 60.1% to 71.2% over the 4 weeks.

Conclusions: These preliminary results provide insight on commonly enacted IIs for each HRSS type during a cessation attempt among KAEA smokers. Future versions of MyQuit USC will incorporate these findings to develop a more context-relevant cessation aid. Specifically, information about an individual’s II enactment patterns may be leveraged to adapt the provision of real-time individualized support, e.g. alternative IIs, according to personally relevant HRSS.

A LONGITUDINAL ANALYSIS OF SOCIAL SUPPORT RECEIVED FROM AN ONLINE COMMUNITY FOR CANCER SURVIVORS AND CAREGIVERS

Tenbroeck Smith, M.A.[1], Bennett R. McDonald, MPH[1], Elizabeth Fallon, Ph.D.[1], J. Lee Westmaas, PhD[1], Robert E. Kraut, PhD[2], Kenneth M. Portier, PhD Biostatistics[3]

[1]American Cancer Society, Atlanta, GA; [2]Carnegie Mellon University, Pittsburgh, PA; [3]American Cancer Society, Global Headquarters, Atlanta, GA

Introduction: Cancer survivors and caregivers increasingly use online communities, but little research has shown the efficacy of these communities for improving social support. The American Cancer Society's Cancer Survivors Network (CSN) is an online social networking community where survivors and caregivers can exchange information and emotional support regarding the cancer experience. The purpose of this study was to examine whether CSN use increases social support among cancer survivors and caregivers.

Methods: CSN members completed web surveys at baseline (T1) and 3-months (T2; N = 821). Perceived Emotional/Informational Social Support from CSN (SSCSN) was measured using items adapted from previously validated instruments. Member-reported use of CSN features was summarized in two scores: 1) *Interactive Use* involved contributing to the community (e.g., posting to discussion boards, chatting, writing blogs); 2) *Reading* was limited to information consumption (e.g., reading discussion boards or blogs). Dichotomized *Interactive* scores from T1 and T2 were used to create four groups reflecting patterns of use: Low-Low (low use at T1 and T2), Low-High (low use at T1 and high use at T2), High-Low or High-High. Similar groups were created for *Reading*. Two separate generalized linear models were used to assess whether patterns of *Reading* or *Interactive Use* predicted SSCSN at T2, controlling for SSCSN at T1 and covariates (age, gender, race, marital status, education, perceived health, cancer status).

Results: The sample was mostly female (72%), white (87%), survivors (90%) with a mean age of 54.9 (sd = 10.4) years. Using LS-means with Low-Low *Interactive Use* as the referent group, the Low-High group was 0.58 points higher on SSCSN (95%CI: 0.15-1.00), and the High-High group was 0.42 points higher on SSCSN (95%CI: 0.14-0.70). For *Reading*, only the High-High group had a higher LS-means SSCSN (.31; 95%CI: 0.10-0.53) than the Low-Low group.

Discussion: Our results show that CSN use leads to higher levels of social support from that community by approximately half a point on the 5-point SSCSN scale. Interactive use (e.g.,

posting to discussion boards) seems particularly important, whereas passive reading, alone, was associated with greater perceived social support only when reading levels were consistently high. The literature suggests that the perceived social support provided by CSN helps survivors and caregivers adapt to and cope with cancer.

A MODEL OF LONELINESS, SLEEP, AND DEPRESSION AMONG LUNG CANCER PATIENTS ON ACTIVE ONCOLOGIC TREATMENT: A DAILY DIARY STUDY

Timothy J. Williamson, M.A., MPH[1], Alyssa K. Choi, B.A. (in progress)[1], Julie C. Kim, B.A.[1], Annette L. Stanton, Ph.D.[2]

[1]University of California, Los Angeles, Los Angeles, CA; [2]UCLA, Los Angeles, CA

Background: Loneliness predicts important health outcomes such as depression and mortality in both healthy and medical populations. Hawkley and Cacioppo (2010) suggest that sleep quality and daytime functioning (i.e., alertness, fatigue) may be mechanisms through which loneliness predicts health morbidity. Loneliness has been associated with poor sleep quality and subsequent impaired daytime functioning among older adults. Yet, no study has investigated associations between loneliness, sleep quality, and daytime functioning within a medical population. Loneliness is a prevalent concern among lung cancer (LC) patients, who also evidence high rates of sleep disturbance and depression. As such, it is important to 1) understand the extent to which loneliness predicts depression among LC patients and 2) investigate whether sleep quality and daytime dysfunction mediate the posited relationship between loneliness and depression. **Method:** Participants (n=33) were men and women receiving treatment for LC. Participants completed a sleep diary at home for seven days. They answered questions about sleep quality at the start of every morning and about loneliness and daytime functioning at the end of each day. Participants also completed the Center for Epidemiologic Studies-Depression scale (CES-D) at the end of the week. Serial mediation was conducted to test the hypothesis that loneliness predicts poor sleep quality, which in turn predicts daytime dysfunction, which in turn predicts higher depressive symptom severity. **Results:** Loneliness and CES-D scores were significantly related (r = .53, p = .001). The relationship between loneliness and depression symptom severity was significantly mediated by daytime dysfunction (b = 4.05, SE = 2.47, 95% CI [0.57, 11.66]) but not by sleep quality (b = 0.40, SE = 2.40, 95% CI [-0.99, 3.75]). Loneliness was unrelated to sleep quality (b = -4.85, SE = 9.20, 95% CI [-23.56, 13.87]), and sleep quality was the only variable in the serial mediation model that was not a significant predictor of depressive symptom severity (b = -0.08, SE = 0.06, 95% CI [-0.20, 36.52]). **Conclusions:** Findings indicate that loneliness is a significant predictor of depressive symptom severity among LC patients and that daytime dysfunction, but not sleep quality, partially mediates this relationship. Although many LC patients evidence poor sleep quality, our results suggest that daytime dysfunction is a more potent predictor of depression in this sample.

A SYSTEMATIC REVIEW OF THE EFFECT OF PATIENT NAVIGATION ON SATISFACTION WITH CANCER CARE

Kevin W. Campbell, Bachelor of Arts [1], Kristen Wells, Ph.D., MPH[1], Ambuj Kumar, M.D., MPH[2], Tatianna Clark, NA[3], Pascal Jean-Pierre, Ph.D.[4]

[1]San Diego State University, San Diego, CA; [2]Morsani College of Medicine, University of South Florida, Tampa, FL; [3]San Diego State University, Chula Vista, CA; [4]University of Notre Dame, Notre Dame, IN

Cancer is a leading cause of death in the United States, with disparate effects on racial-ethnic minorities and lower socioeconomic groups. Patient navigation (PN) is a supportive patient-centered model in which an individual guides a patient through the medical system and helps him or her overcome barriers to healthcare. It is not known whether PN is associated with increasing satisfaction with cancer care. A systematic review was conducted to assess studies between the years 1995 and 2016 to integrate findings pertaining to the effectiveness of patient navigation in the context of satisfaction with cancer care. To be included, studies were required to evaluate patient navigation related to cancer care, include a comparison group, and measure patient satisfaction with care after the PN intervention. Nine studies met inclusion criteria, but only five (one randomized controlled trial [RCT] and four observational studies) had adequate data for meta-analysis. Sample sizes for each individual study at baseline ranged from 44 to 1,788 participants, with 4,210 patient satisfaction surveys completed. Additionally, the type of cancer care (i.e., head and neck cancer, breast cancer) among studies was greatly varied, as was the methodological quality of studies. Results from the pooled observational studies' data showed a statistically non-significant association between PN and satisfaction with cancer care [standardized mean difference (SMD)=0.39; 95% Confidence Interval (CI):-0.02, 0.80, p=.06]. Additionally, results from the only RCT included in the final analysis showed a significant increase in satisfaction with cancer care when PN was implemented (SMD: 2.30; 95% CI:1.79, 2.80, $p < .001$). The contrast in findings, in addition to the fact that half of the studies were rated as being weak methodologically, indicates a need to conduct studies of higher quality to further investigate whether patients who receive PN are more satisfied than those who do not.

“I DIDN’T KNOW THERE WERE OTHER OPTIONS”: USING BRECONDA TO ASSIST WOMEN AT HIGH BREAST CANCER RISK WITH SURGICAL DECISION MAKING

Kerry Sherman, PhD[1], Christopher J. Kilby, MRes (Psy)[2], Laura-Kate Shaw, BA Psych Hons[1], Kathy Tucker, MBBS[3], Judy Kirk, MBBS[4], Elisabeth Elder, PhD[5]

[1]Macquarie University, Sydney, New South Wales, Australia; [2]Macquarie University, North Ryde, New South Wales, Australia; [3]Prince of Wales, Sydney, New South Wales, Australia; [4]Westmead Hospital, Westmead, New South Wales, Australia; [5]Westmead Breast Cancer Institute, Sydney, New South Wales, Australia

Introduction: Women at risk for hereditary breast cancer may opt for risk reducing mastectomy. Part of this decision-making entails preference-based decisions regarding whether, and how, to restore breast shape after mastectomy. We developed an online decision aid, BRECONDA, to assist with this decision-making. In a randomised controlled trial we compared the efficacy of BRECONDA with a general educational booklet.
Methods: Women at risk (N=87), who were recruited into the multicentre web-based trial from hereditary cancer clinics, completed baseline questionnaires including measures of decisional conflict, satisfaction with information and knowledge. Participants were then randomly assigned to either: 1) Intervention (INT) - received unlimited access to BRECONDA and an information booklet about breast reconstruction; or, 2) Control (CONT) - received the information booklet alone. At 2-months participants completed a follow-up questionnaire re-assessing satisfaction with information, knowledge, and decisional conflict regarding the choice to have risk reducing mastectomy. INT participants also completed user acceptability ratings for BRECONDA.
Results: Linear mixed model analyses demonstrated significant time x condition effects so that by 2-months INT participants reported greater increases in satisfaction with information (F=9.98, $p < .005$) and knowledge (F=12.23, p=.001) than controls. By 2-months there was a significant effect for time, and condition, but not time x condition, with both INT and CONT experiencing similar reductions in decisional conflict. However, by 2-months mean scores of decisional conflict for INT participants (M=17.68) indicated that they had implemented their decision, whereas the mean score of CONT participants (M=27.39) indicated that they were still indecisive. The majority (73%) of INT participants reported high to very high satisfaction with the intervention.
Conclusions: These findings indicate that participants receiving BRECONDA benefitted through having greater satisfaction with information and knowledge about breast reconstruction

options, and reduced decisional conflict. Along with high user acceptability, these findings support the feasibility of implementing BRECONDA into hereditary breast cancer clinics.

“I DON’T WANT TO LIVE WITH THE REGRET”: UNDERSTANDING SURGICAL DECISIONS MADE BY YOUNG WOMEN WITH BREAST CANCER

Shoshana Rosenberg, ScD, MPH[1], Mary L. Greaney, PhD[2], Andrea Patenaude, PhD[1], Meghan Meyer, N/A[3], Ann Partridge, MD, MPH[1]

[1]Dana-Farber Cancer Institute, Boston, MA; [2]University of Rhode Island, Kingstom, RI; [3]Dana Farber Cancer Institute, Boston, MA

Background: Due to an increasing number of young women with unilateral breast cancer (BC) choosing contralateral prophylactic mastectomy (CPM), there is a need to better understand this choice of a procedure which is of limited medical benefit for most women. Using a series of focus groups (FG), we sought to explore surgical decision-making in young BC survivors.

Methods: Women diagnosed with stage 0-3 BC in the past 1-3 yrs at age ≤40 who had undergone BC surgery were recruited. Four FG were conducted: 2 with women after bilateral mastectomy, 2 with women who kept their contralateral breast (lumpectomy or unilateral mastectomy). FG were recorded and transcribed with identifiers removed. Emergent themes were identified by thematic content analysis using NVivo 11. Participants also completed a demographic/clinical survey.

Results: Of 20 participants (4-6 per FG) median age at diagnosis was 37; 10% (2/20) identified as Hispanic; 70% had Stage 1 (4/20) or 2 (10/20) disease. Few were carriers of a BC pre-disposing mutation, with a higher proportion of carriers in the CPM (3/11) vs other surgical group (1/9). Concern about contralateral BC and recurrence were common among women who chose CPM. Women stated they “sleep better at night” due to their decision, did not “want to take chances,” and that if BC recurred, they “had tried at least everything.” Other contributors to choice of CPM included cosmetic symmetry and anxiety about surveillance. For women who kept their contralateral breast, identified themes associated with their choice included a desire to breastfeed in the future and “to look normal and look my age.”

Conclusions: Young women who choose CPM often are concerned about future BC events, despite the fact that risk of future breast events is low and CPM does not improve survival, suggesting some have difficulty accepting even a small level of risk and gain peace of mind as a result of choosing more extensive surgery. There is a need to develop novel, targeted interventions to help women to manage their concerns in the short and long-term, ensuring decisions are patient-centered and evidence-based.

“THE EYE OF THE HURRICANE”: AN INTEGRATED MIND-BODY MEDICINE PROGRAM FOR INDIVIDUALS TREATED IN A UNIVERSITY CANCER CLINIC (UCC)

Brian Arizmendi, MA[1], Mark Gilbert, MD[2], Catherine Shisslak, Ph.D.[3]

[1]Department of Psychology, University of Arizona, Tucson, AZ; [2]Department of Psychiatry, Banner University of Arizona Medical Center, Tucson, AZ; [3]University of Arizona, Tucson, AZ

Considerable evidence has emerged supporting the benefits of mind-body medicine techniques adjuvant to traditional medical interventions. Many studies have examined various aspects of this practice including meditation, relaxation, and psychoeducation. However, few programs utilize a truly integrated approach that interweaves psychoeducation, experiential practice, and group process elements simultaneously – leaving participants to synthesize separate components on their own. Extant studies are conducted in structured research settings which lack the veridicality of a multidisciplinary UCC. We examined the effectiveness of an integrated mind-body medicine program in cancer survivors treated at a UCC. Methods: Utilizing a quasi-experimental pre-post design, this study examined the effect of a 10-week mind-body medicine program combining aspects of the traditional skill-building model, with psychoeducation and group process elements. Changes in psychological symptomatology and well-being were measured in 45 individuals at various stages of cancer treatment. Results: Paired-sample T-tests comparing patients pre- and post-intervention yielded consistent program effects for decreased generalized anxiety (GAD-7), $t(44) = 5.24$, $pt(43) = 3.87$, $p < .001$, and increased well-being (WHO-5) $t(44) = -4.27$, $p < .001$. Average change on these measures are all considered to be clinically meaningful changes based on extant normative data. Discussion: This study supports the effectiveness of a comprehensive mind-body medicine group that simultaneously incorporates skill-building, psychoeducational, and group process components towards significant positive shifts in patient well-being. Results reflect statistically reliable and clinically meaningful improvements in anxiety, perceived stress symptomatology and quality of life, adding to the literature supporting mind-body medicine practices. Methods for implementing such a group in a multidisciplinary community environment will be discussed.

ACUTE EXERCISE EFFECTS ON ANXIETY IN BREAST CANCER SURVIVORS

Elizabeth Awick, MS[1], Arthur Kramer, PhD[2], Kendrith Rowland, MD[3], Edward McAuley, PhD[4]

[1]University of Illinois at Urbana-Champaign, Urbana, IL; [2]Northeastern University, Boston, MA; [3]Mills Breast Cancer Institute, urbana, IL; [4]University of Illinois at Urbana Champaign, Urbana, IL

Many women report increased levels of anxiety and depression after a breast cancer diagnosis. While past research suggests that acute bouts (i.e., single sessions) of exercise may be beneficial in reducing such emotional distress, much of this work is grounded in high intensity exercises. However, negative side effects of the disease such as fatigue and reduced physical function make it difficult for many survivors to engage in such activities. The purpose of the present study was to examine the effects of moderate-intensity walking on anxiety and depression in breast cancer survivors. Breast cancer survivors (N=25; M age=49.81) engaged in 30 minutes of supervised, moderate-intensity aerobic exercise that consisted of walking on a treadmill at 40-60% of their maximal heart rate, as determined by a graded maximal exercise test. Immediately before and after the exercise session, participants completed the Hospital Anxiety and Depression Scale (HADS). Repeated measures analyses of variance revealed a significant time effect for the anxiety subscale [$F(1,23)=8.78$, $p=.007$, $\eta^2=0.28$], such that the women demonstrated significantly reduced anxiety post-exercise. There were no significant changes in the depression subscale ($p=.21$). Additional between-subjects analyses revealed a significant time by age interaction [$F(1,23)=3.36$, $p=.039$, $\eta^2=0.17$], suggesting that women over the age of 50 demonstrated greater reductions in anxiety compared to women aged 50 and younger. The present findings are encouraging in light of the host of negative psychosocial consequences that accompany a cancer diagnosis. This study suggests that breast cancer survivors who suffer from increased anxiety levels may engage in a moderate intensity walk for 30 minutes for positive mood changes. Additionally, survivors over the age of 50 may benefit more from such an exercise bout. Future studies should determine how long these effects may last for prolonged anxiety relief.

AN EXAMINATION OF MEDIATORS IN THE RELATIONSHIPS BETWEEN PERCEIVED CANCER RISK, HEALTHY EATING, AND PHYSICAL ACTIVITY

Tya M. Arthur, PhD, MPH, CPH, Cassie Maxwell, BS

Ball State University, Muncie, IN

Background: Cancer continues to be a major health problem in the U.S. There were an estimated 1.69 million new cases of cancer in 2016. Approximately one-third of the most common cancers could be prevented through maintaining a healthy weight and engaging in health promoting behaviors (e.g., healthy eating, physical activity). There is some evidence that perceived cancer risk influences engagement in health promoting behaviors; however, the mechanisms behind this relationship need further examination. The purpose of this study was to (a) examine the associations between perceived cancer risk (PCR), fruit and vegetable (F&V) consumption, and physical activity (PA), and (b) separately test the indirect effects of PCR on F&V consumption and PA as mediated by cancer worry (CW) and the belief that health promoting behaviors (HPBs) matter in cancer prevention. Methods: The study sample included 3,677 participants (Mean Age=51.95, *SD*=21.17) from the fourth cycle of the 2014 Health Information National Trends Survey. More than half of the sample self-identified as non-Hispanic White (53.3%) and had a household income of < $75,000 per year (62.4%). Path analysis was used to test the direct and indirect effects of PCR on F&V consumption and PA while controlling for race/ethnicity, age, and income. Results: PCR was inversely associated with F&V consumption (r=-0.24, $p < .001$) and PA (r=-0.23, $p < .001$). The indirect effects of PCR on F&V consumption and PA through CW were both statistically significant as well as the indirect effects of PCR on F&V consumption and PA through the belief that HPBs matter in cancer prevention. Conclusions: The results have implications for health messages and intervention strategies to increase health promoting behaviors and prevent cancer. Cancer prevention researchers and practitioners should not only educate people about the threat of cancer but also consider strategies that build affect with regard to cancer (e.g., cancer worry emotions) and promote the belief that health promoting behaviors have an influence on preventing cancer.

AN INTERVENTION TO IMPROVE SYMPTOMS OF DISTRESS IN CAREGIVERS OF PATIENTS WITH STEM CELL TRANSPLANT: FINAL RESULTS

Alaina Carr, BA[1], Tanisha Josi, PhD[2], Kristin Kilbourn, PhD, MPH[3], Jean Kutner, MD, MSPH[4], Mark L. Laudenslager, PhD[5], Nicole Amoyal Pensak, PhD[2]

[1]University of Colorado at Denver, Denvwr, CO; [2]University of Colorado Anschutz Medical Campus, Aurora, CO; [3]University of Colorado at Denver, Denver, CO; [4]University of Colorado School of Medicine, Auora, CO; [5]University of Colorado Denver Anschutz Medical Campus, Aurora, CO

Purpose: Caregivers of patients with Autologous Hematopoietic Stem Cell Transplant (auto-HSCT) experience significant burden and distress including anxiety and depression. This qualitative study explored valuable feedback of caregivers regarding a psychoeducation and skills-based (Pep-Pal) program. We aimed to identify caregiver perspectives in terms of the look and feel, acceptability, usability, and feasibility of Pep-Pal as a web-based intervention for reducing caregiver distress.

Methods: We conducted individual qualitative interviews with 9 caregivers of patients with auto-HSCT. Each caregiver participated in a semi-structured interview that consisted of watching an introduction video and three full-sessions. The interview guide encompassed five primary domains 1) look and feel 2) content 3) usability 4) acceptability and 5) feasibility of the program. Applied thematic analysis was conducted on each interview to draw out themes. The authors (NAP and TJ) independently reviewed the transcripts and discussed themes emerging from the data. They applied open coding to the transcripts and developed an initial codebook. After discussing the codebook and agreeing upon the codes, author TJ coded all transcripts independently and identified broad themes within each domain. These themes used further developed the Pep-Pal program.

Results: Many themes emerged from the interviews. In terms of look and feel, an overwhelming response felt the animation was off-putting or “*cheapened*” the message the video had to provide. Many caregivers felt different aspects of several videos took away from the messages being communicated, for example, the background music being too loud during a body can exercise or intimacy video. In terms of content, several caregivers reported feeling validated by the intervention because they felt it accurately reflected their experiences and the challenges associated with their role. Many caregivers requested more specific examples about the caregiver experience related to cancer and that the program be used in addition to

one on one support. All caregivers felt they could navigate the sessions on their own with little to no difficulty and some even went further and said it was convenient and easy to use. Themes emerged regarding improvements for the program and included adding pauses or instructions on how and when to complete exercises. Participants felt using the Pep-Pal mobilized program would be an acceptable way to get support. Caregivers noted the brevity of the sessions, especially the mini-peps, and the semi structured nature of the sessions with flexibility to move around from topic to topic make it more acceptable to use.

Conclusion: The qualitative results from the caregiver individual interviews were integrated into the final development of Pep-Pal with the goal of enhancing dissemination, engagement, acceptability, and usability.

ANALYSIS OF NATURAL LANGUAGE: A NOVEL APPROACH TO UNDERSTANDING THE THEMES OF BREAST CANCER SURVIVORSHIP

Amelia Stanton, BA, Jennifer Currin-McCulloch, LMSC, OSW-C, Barbara Jones, PhD

The University of Texas at Austin, Austin, TX

When individuals are diagnosed with breast cancer, they receive an onslaught of information about medical treatments, potential changes to their body image, future side effects, and shifts in their familial and occupational roles. Post-diagnosis, some may turn to social media for resource information and peer support. Social media offers unique advantages for health professionals seeking to answer complex research questions. Namely, the quantity of natural language data that can be gleaned from social media is enormous, and the anonymity of the Internet may help facilitate the discussion of difficult subjects. The purpose of this study was to assess themes that emerge when individuals talk about breast cancer in a “real-world” setting—that is, outside of the laboratory—in order to inform practitioners who are providing treatment to this population. Natural language (*n* = 1051 posts) was extracted from a breast-cancer related subsection of a popular social media website and analyzed via the meaning extraction method (MEM), an advanced computerized text analysis technique that identifies words that relate to specific implicit themes across texts. The procedure extracted seven unique themes germane to breast cancer: diagnosis, social support, risk, existentialism, treatment process, information seeking, and surgery. Each of these themes was comprised of frequently used words across posts. This approach validated other themes that have been noted in previous qualitative studies and uncovered specific nuances of the breast cancer experience that have not yet been explored in laboratory-based research. These results also offer health care providers with insight on relevant topics to address with this population during treatment or therapy.

BELIEFS ABOUT CANCER DIAGNOSIS AND THEIR IMPACT ON COMORBID DIABETES MANAGEMENT

Kimberly Muellers, MPH, Juan Wisnivesky, MD, DrPH, Jenny J. Lin, MD, MPH

Icahn School of Medicine at Mount Sinai, New York, NY

Background

With improved survival and prognosis for many cancers, it is increasingly important to understand how a cancer diagnosis may impact patients' long-term health and how beliefs about cancer impact management of comorbidities. We undertook this study to assess the effect of beliefs about cancer on comorbid diabetes management.

Methods

We recruited patients with type II diabetes who were newly diagnosed with early-stage breast, prostate, lung or colorectal cancer and enrolled age-, gender- and hemoglobin A1c-matched diabetes patients. All patients completed the Beliefs and Illness Perceptions Questionnaire (BIPQ) for diabetes, and cancer patients also answered the BIPQ for cancer. Diabetes management behavior was based on the Summary of Diabetes Self-Care Activities (SDSCA) questionnaire ("On how many of the last seven days did you test your blood sugar?" and "On how many of the last seven days did you test your blood sugar the number of times recommended by your health care provider?"). Non-parametric analyses were used to assess the relationship between beliefs about cancer (or diabetes) and diabetes self-management behaviors.

Results

To date, we have recruited 141 patients, of which 55 were newly diagnosed with cancer. The average age was 62.3 years and 57% were male. Of the cancer patients, 53% had prostate cancer, 34% had breast cancer, 3% lung cancer and 9% colon cancer. Compared to non-cancer patients, cancer patients tested their blood glucose levels (2.9 vs. 4.1, p=0.018) or followed recommended glucose monitoring (3.6 days vs. 4.9 days, p=0.017) on fewer days in the past week. However, there was no significant difference between cancer and non-cancer patients' diabetes beliefs, including perceived control and effectiveness of treatment. Beliefs about diabetes were also not associated with blood glucose monitoring frequency or adherence. Among cancer patients, perceived control over cancer was associated with blood glucose monitoring adherence. Those with low perceived control over their cancer reported blood glucose testing 1.6 days per week (SD=2.29) compared to 3.9 days among patients with high perceived control (p=0.003). Patients with low perceived control over cancer also monitored as recommended fewer days per week (2.3 vs. 4.8, p=0.007).

Conclusion

Our results indicate that patients with newly diagnosed cancer and comorbid diabetes had poorer adherence to glucose monitoring recommendations than patients with no cancer history. While cancer and non-cancer patients did not differ significantly in their beliefs about diabetes, cancer patients who felt they had less control over their cancer were less adherent to glucose monitoring. This finding suggests that beliefs about cancer, rather than beliefs about diabetes, may have a stronger impact on cancer survivors' management of their comorbid diabetes.

BEYOND DISTRESS ASSESSMENT: LEVERAGING TECHNOLOGY FOR PSYCHOSOCIAL SCREENING AND DYNAMIC REFERRAL

Cori McMahon, Psy.D.[1], Tina Harralson, PhD[2], Laura Dietzen, M.S.[3], Rebecca Watson, BA[3], Philip Fizur, MA[4], Kelly Lynn. Gilrain, PhD[5], Mark Redlus, BA[6]

[1]Cooper University Hospital, Department of Medicine, Woodbury, NJ; [2]Polaris Health Directions, Wayne, PA; [3]Polaris Health Directions, Inc, Wayne, PA; [4]MD Anderson Cancer Center at Cooper, Cooper University Hospital, Camden, NJ; [5]Cooper University Hospital, Camden, NJ; [6]Polaris Health DIrections, Inc, Wayne, PA

Based on the American College of Surgeons Commission on Cancer (CoC) standards, all accredited cancer centers were required to implement procedures for distress screening by the year 2015. As distress is often unrecognized and greatly impacts quality of life and cancer outcomes, effective screening for and management of distress can improve overall health functioning. Nationally, accredited cancer centers have implemented distress screening procedures in a variety of ways based on resources and efficiency of work flow, including paper-and-pencil questionnaires or face-to-face report with medical providers, for example. Given the opportunity to achieve regular distress screening procedures, MD Anderson Cancer Center at Cooper University Hospital established a more comprehensive psychosocial screener system by leveraging technology for patient report and dynamic referral to appropriate providers. The purpose of this study is to determine the utility of a computerized psychosocial screener that employs iPads, interfaces with the electronic medical record, and assesses distress as well as other important issues. Using the Polestar™ platform, 379 subjects were screened with mean age 61.3 (range: 21-90); with top 3 disease sites: 35% breast cancer, 13% lung cancer, and 13% unknown. Seventy-seven % were Caucasian, 19% African American; and 55% married. 59% reported moderate to severe distress, 23% screened positive for both anxiety and depression (PHQ2 & GAD2); 53% reported at least a little functional disability due to physical issues and 31% due to emotional issues. The majority of subjects reported good social support (82% always get help, 78% someone listens) and few problems with personal relationships (86% no problems). Regarding substance use, 21% acknowledged risky drinking, 21% reported smoking and 11% of those are interested in quitting smoking. Finally, other problems reported include financial (27%) and transportation (7%). Based on specific criteria, referrals were triggered to appropriate services, including: Behavioral Medicine (62%), Social Work (50%), Dietician (31%), and Spiritual Counseling (6%). Implementation of this screening system significantly increased the number of referrals sent to various supportive care services (Behavioral Medicine increased by 41-623% monthly in a

two-year period), thus demonstrating the ability to identify patients in need and to do so efficiently via dynamic electronic referral and report placed in EMR for ease of use for providers.

BODY IMAGE CHANGES IN BREAST CANCER SURVIVORS DURING A WEIGHT MAINTENANCE INTERVENTION

Rebecca L. Hunter, Ph.D.[1], Christie Befort, PhD[2]

[1]Rush University Medical Center, Downers Grove, IL; [2]University of Kansas Medical Center, Kansas City, KS

Breast cancer treatments can have significant effects on a woman's body image due to the treatment itself (e.g., surgery) or due to treatment-related side effects (e.g., weight gain). While previous work suggests improvements across dimensions of body image during a weight loss intervention, little is known about subsequent changes in body image during weight maintenance or weight regain. This study evaluated changes in body image dimensions in breast cancer survivors during a weight maintenance intervention and predictors of those changes, including demographic characteristics, breast cancer treatment history, baseline depressive symptoms, percent weight regain, and physical activity change. The Body Image and Relationships Scale (BIRS) assessed 6 dimensions of body image relevant for breast cancer survivors: changes in social activities due to treatment-related symptoms, energy and strength, discomfort/embarrassment due to treatment-related appearance changes, body integrity (feeling natural and whole), sense of control over health, and sexual attractiveness. While enrolled in a weight control trial, participants lost an average of 13.6±5.7% of baseline weight during the 6-month group phone-based weight loss intervention. All 6 body image dimensions and total score improved upon completion of the weight loss intervention (effect sizes ranged from d=0.5 to 1.4), although percent weight loss and physical activity were not significant predictors. Participants (n=75, age=58.6±8.1 years, time since treatment=3.6±2.4 years, baseline BMI=34.4±4.1 kg/m^2) regained an average of 36.4±44.8% of lost weight during a 12-month randomized phone- and newsletter-based weight maintenance intervention. Five body image dimensions with the exception of changes in social activities worsened upon completion of the weight maintenance intervention (effect sizes ranged from partial η^2=0.06 to 0.18). Multiple linear regressions revealed that married women experienced less worsening of discomfort due to appearance (t=2.0, p < .05) and sense of control (t=2.1, p < .05) than their single counterparts. Higher baseline depressive symptoms predicted greater loss of control (t=-2.1, p < .05). Notably, women who regained more weight experienced greater worsening of energy and strength (t=-2.5, p < .05), discomfort due to appearance (t=-4.0, p < .001), and body integrity (t=-2.0, p < .05). Treatment history and changes in physical activity were not significant predictors. In contrast to the impact of weight loss, weight regain may directly impact dimensions of body image in breast cancer survivors. However, the magnitude of

change was less profound during the weight maintenance intervention, suggesting that survivors may still benefit from improved body image when compared to their body image prior to engaging in the weight loss intervention.

BREAST AND OVARIAN CANCER RISK MANAGEMENT FOLLOWING TELEPHONE VS. IN-PERSON GENETIC COUNSELING AND TESTING

Hannah Segal[1], Beth N. Peshkin, MS, CGC[2], Marc D. Schwartz, PhD[3], Heiddis Valdimarsdottir, PhD[4]

[1]Georgetown University Medical Center, Alexandria, VA; [2]Georgetown University, Washington, DC; [3]Georgetown University/Lombardi Cancer Center, Washington, DC; [4]Reykjavik University, Reykjavik, N/A, Iceland

Genetic counseling and testing is central to the clinical care of women at risk for hereditary breast and ovarian cancer (HBOC). Women at high risk following testing can reduce their risk through surgery or increased screening. In a multi-site randomized noninferiority trial, we compared telephone genetic counseling/testing (TC) to standard in-person counseling/testing (SC) for HBOC. TC was noninferior to SC on all genetic counseling/psychosocial outcomes. Here, we compare TC to SC on cancer risk management outcomes 12-months post-randomization.

Women 21-85, referred for genetic counseling at one of the study sites, without a new or metastatic cancer diagnosis were randomized to TC vs. SC. Of 669 women randomized, 514 completed the 12-month follow up. We found no differences in attrition between TC and SC.

Although not powered to test noninferiority on risk management outcomes, we compared TC vs. SC on use of risk reducing mastectomy (RRM) and oophorectomy (RRO), and breast and ovarian cancer screening (mammography; MRI; CA125; ultrasound). In bivariate analyses, TC and SC did not differ on any risk management outcome ($p>.10$). In separate multivariate logistic models, we included significant bivariate predictors of the outcome along with test result and group assignment. RRM was predicted by: positive test result (OR=2.5, 95% CI = 1.04, 6.2) and cancer distress (IES; OR=1.3, 95% CI = 1.04, 1.5); mammogram was predicted by: positive test result (OR=4.1, 95% CI = 1.8, 9.4), being married (OR=2.7, 95% CI = 1.4, 5.4), being above age 50 (OR=5.2, 95% CI = 2.2, 12.5), and having a lower a priori mutation risk (OR=.74, 95% CI = .58, .94); MRI was predicted by: positive test result (OR=7.4, 95% CI = 3.8, 14.9) and being affected with BrCa (OR=3.7, 95% CI = 2.1, 6.7); RRO was predicted by: positive test result (OR=16.7, 95% CI = 7.2, 38.5) and being married (OR=6.2, 95% CI = 2.2, 17); ultrasound was predicted by: positive test result (OR=2.6, 95% CI = 1.3, 5.4), being affected with BrCa (OR=2.4, 95% CI = 1.4, 4.2) and higher cancer distress (OR=1.2, 95% CI – 1.1., 1.4); CA125 was predicted by positive test result (OR=2.8, 95% CI = 1.5, 5.5). We also evaluated the

group by test result interaction effect in each model. This effect was significant for CA125. SC participants with a positive BRCA test result were more likely to obtain a CA125 than TC participants who tested positive.

Despite being underpowered for noninferiority analyses on risk management outcomes, these traditional analyses are consistent with our prior findings indicating that TC is a safe and cost effective approach to increase access to genetic testing. The finding that mutation carriers in the TC arm were less likely than those in the SC arm to undergo ovarian cancer screening should be interpreted in light of the fact that ovarian cancer screening is <u>not recommended</u> for BRCA mutation carriers given evidence that it does not reduce ovarian cancer mortality.

BREAST DENSITY KNOWLEDGE AND INTENTIONS FOR BREAST CANCER SCREENING IN A DIVERSE SAMPLE OF WOMEN AGE ELIGIBLE FOR MAMMOGRAPHY

Marimer Santiago-Rivas, PhD[1], Shayna Benjamin, BA[1], Janna Andrews, MD[2], Lina Jandorf, MA[1]

[1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Hofstra School of Medicine, Hempstead, NY

While there is considerable evidence showing the association between breast density and breast cancer risk and detection, little is known about women’s awareness and knowledge of their own breast density, and its effect on the likelihood of completing breast cancer screening. The objective of this study was to assess breast density knowledge, breast density awareness, and intention to complete screening for breast cancer in a diverse sample of women age eligible for mammography. We quantitatively assessed breast density awareness and knowledge in black, Latina, and white women recruited online (N=164) and in the community (N=100). The majority of the participants reported having heard about breast density (69.2%), but less than one third reported awareness regarding the New York State Breast Density Notification Law (30.9%) and less than one third knew their own breast density status (30.4%). Language preference for data collection (English), site of data collection (online), breast density awareness, knowledge of own breast density, and responding yes to “Would knowing your breast density make you feel informed to make decisions regarding your breast health?” predicted higher likelihood of intending mammogram completion in the future. An important implication of these findings is that many women may not have access to important health information that may influence their decision making regarding their breast health care.

CANCER DISTRESS SCREENING AT AN URBAN SAFETY NET HOSPITAL: PATIENT CONSIDERATIONS AND ITS IMPACT ON SUPPORT SERVICES

Stephen Lo, MA[1], Leanne Ianniello, BS/MPH[2], Malti Sharma, RN[3], Diane Sarnacki, RN, MSN, AOCN[4], Kathleen T. Finn, MSN, ANP, AOCN[5]

[1]Boston Medical Center, Columbus, OH; [2]Boston Medical Center, Brighton, MA; [3]Boston Medical Center, somerville, MA; [4]Boston Medical Center, Framingham, MA; [5]City of Hope, Duarte, CA

Background:

Distress screening and providing support services to cancer patients were points of emphasis made by the US Institute of Medicine. This study explored the relationship between Distress Thermometer (DT) screening, support service usage, and other patient characteristics at an urban safety-net hospital.

Methods:

From January 2009 to December 2013, medical records of 3485 patients with complete data, a cancer diagnosis and pursued care with radiation and/or medical oncology at an urban safety-net hospital were retrospectively reviewed; the DT was implemented in 2011. x^2 tests were used to evaluate differences in DT usage, patient characteristics (race/ethnicity, gender, language, marital status, education, insurance and number of chronic illness) and support service utilization (patient navigation, social work, and behavioral health) between patients starting care before and after the implementation of the DT. In post-DT implementation patients, multiple regression analyses were conducted to evaluate whether DT screening and other patient characteristics predicted the use of support services and an ANOVA with post-hoc Tukey's tests were used to find differences in support service and DT usage on based on insurance type. Opinions on the experience using the DT were evaluated 27 oncology staff from June to August 2014.

Results:

DT usage significantly increased in patients who started care after DT implementation, but only one-third of patients were successfully screened for distress in a span of 3 years since the implementation. Patients screened for distress had greater odds of utilizing patient navigation

(OR=2.3; 95% CI=1.7-3.0) and social work (OR=1.6; 95% CI=1.2-2.0) after controlling for patient characteristics. More patients on Medicare and Medicaid utilized patient navigation and social work than those with private insurance. No difference in the DT screening based on insurance type was found. The majority of staff reported the DT to be helpful in deciding referral to support services; however, patient interviews were thought to be more effective than using the DT. Patient language and literacy were reported to be the largest barriers to screening.

Conclusion:

The impact on DT usage on support service usage is unclear given a potential selection bias in the study and additional support service staff is needed to address cancer distress. Future research to efficiently operationalize distress screening when caring for vulnerable populations is warranted.

CANCER PATIENT PERSPECTIVES REGARDING PREPAREDNESS FOR END-OF-LIFE CARE: A QUALITATIVE STUDY

Allen C. Sherman, PhD, Stephanie Simonton-Atchley, PhD, Cindy W. Mikeal, MS, Kendra Anderson, MS, Konstantinos Arnaoutakis, MD, Laura F. Hutchins, MD, Issam Makhoul, MD, Fade Mahmoud, MD, Natasha Milojkovic, MD, Sarah E. Harrington, MD, James Y. Suen, MD

Winthrop P. Rockefeller Cancer Institute, University of Arkansas for Medical Sciences, Little Rock, AR

The extent to which patients feel prepared for end-of-life care may be associated with important clinical outcomes, such as decisions about aggressive treatment, receipt of care consistent with preferences, healthcare costs, and quality-of-life. Despite growing interest in the concept of "preparedness," however, there is insufficient information about what cancer patients actually need to feel prepared. This qualitative study examined patient perspectives re: preparedness for end-of-life care, in a cohort with terminal disease.

In-depth interviews were conducted with cancer patients who had advanced-stage disease and limited life-expectancies. Enrollment continued until data saturation. Mean age of participants was 63.7 years, 39.8% were non-white, and the sample was diverse with respect to type of malignancy and socioeconomic status. Interviews were audiotaped and transcribed. Thematic analysis was undertaken by 3 investigators, each of whom coded all transcripts. Derivation of codes and themes was facilitated by use of NVivo 11 software.

Six overarching themes emerged. These included concerns about: (1)) end-of-life decisions (e.g., aggressive treatment vs. comfort care, location of care); (2) interactions with the medical team (e.g., pursuit vs. avoidance of prognostic information, symptom control, availability of resources); (3) interactions with family/friends (e.g., burdening the family, support vs. conflict, communication); (4) emotional well-being (e.g., distress, life completion, existential suffering); (5) spiritual well-being (e.g., comfort vs. alienation); and (6) financial well-being (e.g., estate planning, medical expenses).

Findings highlight areas that patients themselves regard as necessary for a sense of preparedness. The ability to manage these challenges was seen as critical at this phase of care. Results offer an important foundation for further research regarding instrument development, prediction of clinical outcomes (e.g., care concordant with preferences, ICU admissions, quality-of-life), and development of targeted interventions.

CHILDHOOD ADVERSITY PREDICTS TRAJECTORIES OF INFLAMMATION, FATIGUE, AND DEPRESSION DURING BREAST CANCER SURVIVORSHIP

Avelina C. Padin, MA[1], Stephanie J. Wilson, PhD[2], Janice K. Kiecolt-Glaser, PhD[2]

[1]The Ohio State University, Columbus, OH; [2]The Ohio State University Wexner Medical Center, Columbus, OH

Breast cancer survivors commonly experience symptoms such as depression, fatigue, and inflammation during and after treatment. For many women, symptoms improve in the months following treatment, but a subset of survivors experience persistent symptoms years after treatment ends. Prior research indicates that childhood adversity predicts elevated symptoms before, during and in the year following cancer treatment; however, studies have not assessed whether adversity produces differential trajectories of symptoms over longer periods of time. The current study assessed childhood maltreatment as a risk factor for poorer short-term and long-term psychological and physical recovery during survivorship. In a parent study, breast cancer survivors stages 0-IV (N = 112) provided data prior to primary cancer treatment (i.e., surgery, radiation, or chemotherapy) and 6 and 18 months post-treatment. The current study utilized scores from the Childhood Trauma Questionnaire, Center for Epidemiological Studies-Depression (CES-D) scale, and Multidimensional Fatigue Symptom Inventory (MFSI-SF), as well as inflammatory marker plasma C-reactive protein (CRP). Women who reported more physical abuse ($b = 0.04$, $SE = 0.02$, $p = .047$), emotional abuse ($b = 0.04$, $SE = 0.02$, $p = .014$), and emotional neglect ($b = 0.04$, $SE = 0.02$, $p = .023$) evidenced greater increases in CRP from baseline to 6 months post-treatment compared to women who reported fewer adversities. Women who reported more childhood physical abuse also had greater increases in fatigue ($b = 0.29$, $SE = 0.12$, $p = .014$) and marginally persistent depressive symptoms ($b = 0.37$, $SE = 0.22$, $p = .091$) from baseline to 18 months post-treatment compared to those who reported less abuse. Sexual abuse and physical neglect did not predict symptom recovery. Given these results, it appears that childhood adversity, particularly physical abuse, has lasting effects on depression, inflammation, and fatigue following breast cancer treatment. For women with a history of adversity, these symptoms may persist up to 18 months after treatment, long after the physical and psychological repercussions of cancer treatment are expected to dissipate. Identifying childhood adversity as a risk factor for persistent inflammation, fatigue, and depression has important implications for survivorship, as these symptoms have been associated with increased risk for metastasis, recurrence, and morbidity among cancer survivors.

CLINICAL AND PSYCHOSOCIAL RISK FACTORS FOR RESIDUAL PAIN IN ADULTS ON A LONG-ACTING OPIOID FOR CANCER-RELATED PAIN

Emily Wright, BA[1], Areej El-Jwahri, MD[2], Jennifer S. Temel, MD[3], Lara Traeger, PhD[2]

[1]Massachusetts General Hospital, Boston, MA; [2]Massachusetts General Hospital/Harvard Medical School, Boston, MA; [3]Massachusetts General Hospital Cancer Center/Harvard Medical School, Boston, MA

Two thirds of U.S. adults with advanced cancer experience cancer-related pain, despite the clinical use of opioids in this population. Given multiple opioid formulations and recent widespread media coverage of opioids, patients' medication taking behaviors and their perceptions of medications may be related to pain outcomes. This study examined clinical and psychosocial risk factors for residual pain among patients on a long-acting (LA) opioid for cancer-related pain.

We analyzed cross-sectional data from ambulatory adult patients (n=100) with locally advanced or metastatic cancer who had a LA opioid prescription for nociceptive cancer pain and were responsible for administering their medications. Participants reported demographic information, perceptions of pain medications (e.g., concerns about efficacy, addiction, side effects), LA opioid adherence in the past week (0-100%), and pain severity (Brief Pain Inventory). Cancer type and LA opioid regimen were obtained from health records. Clinical and psychosocial risk factors for pain were explored using multiple linear regression at $p < .05$.

Participants (53% female, 89.7% non-Hispanic white, M age=57.5 years [SD=12.3]) were diagnosed with diverse cancers (thoracic 27%, genitourinary 22%, sarcoma 20%, breast 17%, gastrointestinal 13%, gynecologic 1%). LA opioid regimens included oral medication (8, 12 or 24 hrs; 74%) or duragesic patch (48 or 72 hrs; 26%), with morphine equivalent dose M=109.3 mg (SD=127.8). 46.4% of participants reported at least moderate pain (≥4/10). In a linear regression model that controlled for patient age, gender, and racial/ethnic minority status, more negative perceptions (B=.32[SE=.12], p=.009) and use of an oral LA opioid (vs. duragesic patch; B=1.18[SE=.53], p=.027) were associated with higher pain. Opioid dose (B=.001[SE=.002], p=.49) and self-reported LA opioid adherence (B=.24[SE=.82], p=.77) were not associated with pain.

Almost half of patients reported at least moderate pain. Patients who had more concerns about pain medications and who were on daily oral doses reported greater pain, regardless of opioid dose or self-reported adherence. These findings support that patients' attitudes and medication taking patterns may be related to pain outcomes. Longitudinal studies are needed to examine pain medication taking behaviors and identify modifiable targets for improving pain management in patients with chronic cancer pain.

CLINICAL EVALUATION OF EMOTIONAL RESPONSES IN PATIENTS WITH CANCER: DIAGNOSTIC ACCURACY COMPARED TO TWO REFERENCE STANDARDS

Wendy Aerts, MSc[1], Joost Dekker, PhD[2]

[1]VU University Medical Center, Amsterdam, Noord-Holland, Netherlands; [2]VU University Medical Centre, Amsterdam, Noord-Holland, Netherlands

Objective. Previous research has suggested that the clinical evaluation by doctors and nurses of emotional responses in patients with cancer is not always adequate. However, we hypothesize that doctors and nurses may be differentiating between emotional responses that do or do not necessitate professional care. The aim of this study was to explore the diagnostic accuracy (sensitivity and specificity) of clinical evaluation of emotional responses compared to two reference standards: (i) emotional distress as reference standard, and (ii) care needs related to emotional problems as reference standard.

Methods. This study was designed as a retrospective cohort study. The clinical evaluation of emotional responses was derived from the medical and nursing file. The Distress Thermometer and Problem List were used to assess emotional distress and care needs related emotional problems. Sensitivity, specificity and the diagnostic odds ratio (DOR) of clinical evaluation were calculated, compared to two reference standards, i.e. (i) emotional distress and (ii) care needs related to emotional problems.

Results. The sample included 120 patients: in 35.7%, the doctor or nurse made notes describing fear, anxiety, stress, low mood or depression, or referred the patient to a mental health professional. According to the Distress Thermometer, 36.8% of the patients experienced emotional distress; and 11.3% expressed a need for care related to emotional problems. The sensitivity of clinical evaluation was 51%, specificity 65% and DOR 1.94 with emotional distress as reference standard. With care needs as reference standard, the sensitivity of clinical evaluation was 77%, specificity 63% and DOR 5.77.

Conclusions. As expected, we found indications that when using care needs as reference, sensitivity of clinical evaluation of emotional responses is higher compared to emotional distress as reference. This provides preliminary support for our hypothesis that doctors and nurses distinguish between emotional responses that do or do not necessitate professional care.

MERITORIOUS AWARD WINNER

COMMUNITY IMPLEMENTATION OF THE BIOBEHAVIORAL INTERVENTION FOR CANCER PATIENTS: A COLLABORATIVE STUDY OF PATIENT OUTCOMES

Claire C. Conley, MA, Barbara L. Andersen, PhD

The Ohio State University, Columbus, OH

Objective: Evidence-based treatments (EBTs) for cancer patients are available, but have not been disseminated for wide use among community mental health practitioners. In a dissemination effort, mental health professionals were trained to deliver the Biobehavioral Intervention (BBI) at their home institutions. A collaborative group reports the effects of BBI on patient outcomes.

Methods: Therapists from 11 sites (82% community settings; hospitals [n = 5, 46%], Cancer Support Community facilities [n = 3, 27%], oncology practice [n = 1, 9%]) delivered the BBI as part of standard care. To maximize external validity, therapists in each setting determined the BBI format (i.e., individual therapy, open group, or closed group), duration, and components of treatment delivered. Therapists reported treatment integrity data at each session. Cancer patients (N=110) completed self-report measures (including the Profile of Mood States [POMS]) pre- and post-BBI. Intervention effectiveness was tested using hierarchical linear multiple regression analyses. Exploratory analyses examined the relationship between significant patient outcomes and treatment integrity variables.

Results: As in BBI efficacy studies, patients' POMS scores significantly decreased from pre-to-post (R^2=0.1, β=-0.3, *p*r=-0.3, *p* < .01). Using the Reliable Change Index, 26% of patients demonstrated clinically significant improvement on the POMS. POMS scores correlated with BBI group type (*r*=-0.3, *p* < .05). M = -22 v. -8). Open group participants evidenced larger decreases than closed group participants (*M*=-22 v. -8). POMS scores also correlated with receipt of BBI in individual format (*r*=0.2, *p* < .05). Participants in individual treatment evidenced smaller decreases than participants in group treatment (*M*=-2 v. -17).

Conclusions: This is the first study to report patient-level data in the context of multi-site therapist implementation of an EBT for cancer patients. Data from this collaborative group provides evidence of the feasibility and effectiveness of the BBI on patient outcomes when delivered by newly trained mental health providers in the community.

COMPARISON OF CANCER BELIEFS BETWEEN APPALACHIANS AND NON-APPALACHIANS AND RELATED SOCIODEMOGRAPHIC CHARATERISTICS

Katrina J. Serrano, PhD[1], Elise L. Rice, PhD[2], Minal Patel, PhD, MPH[3], Chan Thai, PhD, MPH[4], Kelly D. Blake, ScD[5], Robin Vanderpool, BS, MPH, DrPH[6]

[1]National Cancer Institute/Behavioral Research Program, Bethesda, MD; [2]National Cancer Institute, Bethesda, MD; [3]National Cancer Institute, Rockville, MD; [4]Santa Clara University, Santa Clara, CA; [5]Behavioral Research Program, Division of Cancer Control and Population Sciences, National Cancer Institute, National Institutes of Health, Bethesda, MD; [6]University of Kentucky College of Public Health, Lexington, KY

Background: Residents of the 13-state Appalachian region experience poorer health outcomes compared to other geographic populations, including higher rates of cancer incidence and mortality. Studies suggest that cultural beliefs and practices may influence these health disparities. Previous research shows that Appalachians have higher cancer risk perceptions and negative beliefs about cancer but few studies have examined the associations between Appalachian residence, socio-demographics, and cancer belief variables.

Objective: This study examines cancer-related beliefs between Appalachians and non-Appalachians, as well as correlates (i.e., Appalachian residence, socio-demographics, and health status) of those beliefs.

Methods: Data from four administrations (2011-2014) of the National Cancer Institute's Health Information National Trends Survey were combined and analyzed (n=14,451). Descriptive analyses were conducted to examine four items related to cancer beliefs between Appalachians and non-Appalachians. Regression analysis with the entire sample was conducted to examine the correlates of a composite variable representing cancer beliefs.

Results: About 8% (n=1,015) of the survey respondents were from Appalachia. A higher percentage of Appalachians vs. non-Appalachians agreed with statements such as everything causes cancer (69.8% vs. 64.4%) and there were too many recommendations about cancer prevention (79.4% vs. 72.7%). A higher percentage also believed that they were likely to get cancer in their lifetime in general (44.0% vs. 41.6%) as well as compared with people their age (23.1% vs. 18.7%). Regression analyses with the entire sample showed that Appalachians had higher overall negative cancer beliefs than non-Appalachians ($\beta=0.37$, $p < 0.05$). Older vs. younger respondents had lower negative cancer beliefs ($\beta=-0.03$, $p < 0.05$). Additionally, all

other racial/ethnic groups had lower negative cancer beliefs compared with non-Hispanic Whites ($p < 0.05$). Those with a lower education (e.g., high school: $\beta=0.25$, $p < 0.001$) and health status (e.g., poor health: $\beta=1.32$, $p < 0.001$) had higher negative cancer beliefs compared with those with a bachelor's degree and excellent health, respectively.

Conclusions: Appalachians held more negative beliefs about cancer than non-Appalachians, and residing in Appalachia was significantly associated with greater negative cancer beliefs. Tailored communication strategies and interventions for certain socio-demographic groups are needed to provide individuals with accurate information about cancer risk, and to dispel negative cancer beliefs that may be associated with and contribute to Appalachian cancer disparities.

CONFIRMING RESEARCH RESULTS AND OBTAINING CANCER SCREENING 6 MONTHS AFTER LEARNING CDKN2A VARIANT MUTATION STATUS

Carmen Radecki Breitkopf, PhD[1], Emma Leof, BA[2], Jennifer B. McCormick, PhD, MPP[3], Kari G. Chaffee, M.S.[1], Gloria M. Petersen, PhD[1]

[1]Mayo Clinic, Rochester, MN; [2]University of Minnesota Twin Cities, Minneapolis, MN; [3]Pennsylvania State University College of Medicine, Hershey, PA

This study examined whether participants who agreed to learn genetic research results would pursue confirmatory testing in a clinical laboratory of a germline *CDKN2A* mutation (as recommended), which predisposes to pancreatic cancer and melanoma. Post-disclosure behavioral intent to pursue pancreas and skin exams was assessed via self-report immediately after disclosure and at 6 months. Participants were enrollees in a Mayo Clinic Pancreas Research registry and who gave a blood sample. Samples were tested in a research laboratory for the *CDKN2A* mutation*.* 133 at-risk individuals without pancreatic cancer were invited by mail into the disclosure study and to complete a baseline survey, followed by a telephone call in which they would learn their result. Eighty individuals (60%) returned a baseline survey, and 73 (91.3%) learned their mutation status and participated in semi-structured interviews immediately post-disclosure; 72 completed the interview, and one withdrew prior to completion. Six months following disclosure, a survey was mailed which asked about confirmatory genetic testing and uptake of cancer screening (response rate of 87.3% (n=62)). Of 62 participants with complete (interview and survey) data, 14 (22.5%) were mutation carriers and 48 (77.5%) were non-carriers. In the post-disclosure interviews, 29 (46.8%) participants (71.4% (n=10) carriers and 39.6% (n=19) non-carriers) indicated intent to pursue confirmatory testing. At the 6-month follow-up, 21.4% (n=3) of carriers and 2.1% (n=1) of non-carriers reported obtaining confirmatory testing. With regard to cancer screening, 84.6% (11/13) of carriers stated they were “definitely planning” on getting a pancreas check in the next 6 months, as compared to 12.5% (n=6) of non-carriers (p < 0.0001). All carriers indicated that they “definitely planned” to get a skin exam in the next 6 months, compared to 59.6% (28/47) of non-carriers (p=0.003). Six-month follow-up data revealed that 29.4% (n=5; all were carriers) of those with a strong intention to get a pancreas check did, while 56.1% (n=23; 9 carriers and 14 non-carriers) of those with a strong intention to get a skin exam did. Eleven (78.6%) carriers stated that they were “definitely planning” to get a pancreas check in the next year, compared to 4.2% (n=2) of non-carriers (p < 0.0001), and 84.6% of carriers compared to 31.9% of non-carriers intended to get a skin exam in the next six months (p=0.001). Recipients of genetic research results relating to cancer predisposition may not follow-through with their intentions to pursue recommended confirmatory testing, yet carriers at potentially increased risk of pancreatic cancer and melanoma appear to use the genetic information to motivate participation in cancer detection/screening behaviors.

COPING AND ENDOCRINE THERAPY ADHERENCE AMONG WOMEN WITH BREAST CANCER

Emma E. Bright, M.A.[1], Annette L. Stanton, Ph.D.[2]

[1]University of California, Los Angeles, Los Angeles, CA; [2]UCLA, Los Angeles, CA

Rates of non-adherence to endocrine therapies (i.e., tamoxifen, aromatase inhibitors) among women with breast cancer remain high despite their demonstrated effects on survival. In this longitudinal study, we examined contributors to adherence among survivors of breast cancer (N = 130). Participants with breast cancer receiving their initial endocrine therapy prescription were recruited from a large community oncology breast clinic. Participants took part in three interview and questionnaire sessions at the clinic at prescription initiation, one month and four months later. Participants completed a final interview and questionnaire session by phone 12 months later. Questionnaires addressed coping processes used to manage the cancer experience. At the initial appointment, participants were provided a Medication Event Monitoring System (MEMS) cap to assess adherence; the MEMS cap was collected at the four-month follow-up appointment. The MEMS cap measurement, the percent of days a dose was taken, was regressed on hypothesized predictors of adherence. The final regression model accounted for 22.1% of the variance in adherence. Changes in coping accounted for 18.5% of the variance ($p < .05$), and relevant medical/demographic factors accounted for 3.6% of the variance ($p > .05$). An increase in coping through emotional support seeking from study entry to one month was significantly associated with lower adherence at 4 months ($r = -0.26$, $p < .05$), while an increase in coping through positive reinterpretation and growth from study entry to one month was significantly associated with higher adherence at 4 months ($r = .19$, $p < .05$). Increases in coping through seeking emotional support may reflect a deficit in emotional support provided. Taken collectively, these findings addressing women's cognitive appraisals and support needs regarding the cancer experience might promote endocrine therapy adherence.

DESCRIPTION OF PHYSICAL ACTIVITY LEVELS AMONG MYELOPROLIFERATIVE NEOPLASM PATIENTS ENGAGING IN AN ONLINE YOGA INTERVENTION

Ryan Eckert, B.S.[1], Jennifer Huberty, PhD [2], Krisstina Gowin, D.O[3], Linda Larkey, Ph.D.[1], Matthew Buman, Ph.D.[1], Ruben Mesa, M.D.[3]

[1]Arizona State University, Phoenix, AZ; [2]Arizona State University School of Nutrition and Health Promotion, Phoenix, AZ; [3]Mayo Clinic Cancer Center, Phoenix, AZ

Introduction: Cancer patients report lower physical activity (PA) levels than those that are not diagnosed with cancer, particularly during treatment and often times persisting into cancer survivorship. Myeloproliferative neoplasm (MPN) cancer patients are unique in the sense that these individuals often spend the rest of their life undergoing treatment to manage disease progression and symptom burden. MPN patients report a high symptom burden (i.e., fatigue, depression, anxiety, sleep disturbance, etc.) with inactivity reported as a symptom in upwards of 60% of patients. It has been demonstrated that PA can improve a variety of physical and psychosocial side effects of cancer and its treatment. To date there is no information regarding PA levels in MPN patients. Therefore, the purpose of this abstract is to summarize the objective PA levels of MPN patients participating in a 12-week online-streamed yoga intervention.

Methods: Participants were MPN patients (n=38) enrolled in a 12 week online-streamed yoga intervention. Participants were instructed to wear a Fitbit Flex on their non-dominant wrist throughout the study. The Fitbit Flex provides an estimate of daily step counts as well as time spent in sedentary, light, moderate, and vigorous activity. Trajectories of objectively-measured PA were tested using linear mixed models with fixed and random effects for time included in the model.

Results: At baseline, MPN patients averaged 871.8±41.5 min/week of sedentary time, 204.8±13.9 min/week of light activity, 19.3±3.5 min/week of moderate-vigorous physical activity (MVPA), and 6466.9±652.3 steps/day. Throughout the course of the 12-week study, there were no changes in sedentary time, light activity, or steps. However, there was a significant downward trend in daily MVPA (-0.05±0.02; p=.034) over the 12 weeks.

Conclusion: MPN patients engaged in only 19.3±3.5 min/week of MVPA at baseline (as measured by a Fitbit) of the 12-week yoga intervention, and the time spent in MVPA decreased significantly over the course of the study. However, time spent in sedentary and light activities did not change over the course of the study, nor did daily step counts. Future

research is warranted to objectively measure PA in a larger sample of MPN patients, examine unique methods to improve PA behavior, and to identify if increased PA is efficacious for improving symptom burden in MPN patients.

DETERMINANTS OF MULTIPLE HEALTH BEHAVIOR CHANGE IN CANCER SURVIVORS WHO SMOKE

Emily Cox-Martin, PhD[1], Karen Basen-Engquist, PhD, MPH[2], Janice A. Blalock, Ph.D.[3]

[1]Department of Medicine, University of Colorado Anschutz Medical Campus, Denver, CO; [2]The University of Texas MD Anderson Cancer Center, Houston, TX; [3]University of Texas MD Anderson Cancer Center, Houston, TX

Objective: This project investigated associations between determinants of health behavior change for smoking cessation and physical activity (PA) in cancer survivors. Improving our understanding of the relationships between common psychological determinants for different health behaviors may help improve intervention efficiency and effectiveness through multiple health behavior change. Methods: Participants included cancer survivors who were current smokers and had an initial assessment at the Tobacco Treatment Program at MD Anderson Cancer Center. Patients who had been abstinent for over six months (i.e., in “maintenance”) were excluded. Measures of self-efficacy and stage of change were administered for smoking cessation and PA. Results: Participants (n = 76) identified mostly as white (79%) and male (58%) with a variety of cancer diagnoses. For smoking cessation stage of change participants were mostly in contemplation (20%) or preparation (70%); none were in precontemplation and few were in action. For PA, participants showed a wide range of stage of change: precontemplation (9%), contemplation (21%), preparation (38%), action (15%) and maintenance (16%). A significant correlation was demonstrated between self-efficacy for smoking cessation and self-efficacy for PA ($r = .445$, $p = .002$). Stages of change for smoking cessation and PA were not related. The relationship between self-efficacy and stage of change for PA was significant [F(4,55) = 4.058, p =.006], but not for smoking cessation [F(2,52) = 1.399, p=.256]. Relationships for stage of change and self-efficacy across behaviors were non-significant. Conclusion: A significant relationship was found between self-efficacy for these two behaviors but not for stage of change. Furthermore, a relationship between these two determinants was evidenced for PA but not across behaviors. Survivors approaching smoking cessation may have generalized efficacy for health behavior change, but low motivation for changing more than one behavior at a time. Motivational interventions to capitalize on high levels of self-efficacy for both behaviors and influence stage of change might be applicable.

EXAMINING POSTTRAUMATIC GROWTH AS A PREDICTOR OF HEALTH-RELATED OUTCOMES IN PROSTATE CANCER SURVIVORS

Elizabeth L. Addington, PhD

Northwestern University Feinberg School of Medicine, Chicago, IL

Background: Due to high incidence and survival rates of prostate cancer, survivors’ outcomes are important public health issues. Some men with prostate cancer experience positive psychological changes known as posttraumatic growth (PTG), which is posited to operate through psychophysiologic and behavioral pathways to ameliorate survivors’ health and well-being. However, scant research has tested outcomes of PTG, particularly those related to physical health. This study therefore examined PTG as a predictor of health and health behaviors in a sample of 168 prostate cancer survivors. Methods: On average, participants completed baseline measures at 6 months post-diagnosis and follow-up surveys at 5 years post-diagnosis. Demographic and medical covariates were obtained from self-report and medical records. Using the PTG Inventory-Short Form, participants indicated the extent of positive changes in 5 domains (relationships, spirituality, new possibilities, personal strength, appreciation for life) as a result of their prostate cancer. Physical activity was measured with 6 items that assess aerobic activity and strength training, allowing for calculation of weekly MET minutes. Fruit and vegetable consumption was measured with the NCI Food Frequency Questionnaire. Participants rated their general health from poor to excellent. Results: The sample included 58% White and 42% Black men; 99% were diagnosed with locally or regionally confined prostate cancer. Average levels of PTG were moderate (M=2.75). Health behaviors tended to decline over time, such that less than half the sample at 5 years post-diagnosis met activity and dietary guidelines for cancer survivors. In multiple regression analysis controlling for socioeconomic status and medical/health indicators (e.g., education, income, baseline health, Charlson comorbidity index), PTG (b=.12, p=.005) independently predicted prostate cancer survivors’ self-rated health at approximately 5 years post-diagnosis (total R^2=.41, change in R^2=.03, p=.005). PTG was not significantly related to physical activity or to fruit and vegetable consumption, nor did those health behaviors mediate the relationship between PTG and health. Conclusions: Among 5-year survivors of prostate cancer, PTG positively predicted self-rated health, above and beyond socioeconomic and medical indicators. Future studies should continue to examine outcomes related to PTG in diverse samples of cancer survivors, using objective measures when possible. In addition, interventions are needed to improve and sustain health behaviors among prostate cancer survivors, many of whom failed to meet recommended levels of physical activity and fruit and vegetable consumption.

A FORMATIVE EVALUATION STUDY OF AGENCY LEADERS WHO SERVE VULNERABLE POPULATIONS AS PART OF THE CALIFORNIA FIRST FIVE INITIATIVE

Kristen T. Ruckstuhl, MS, BA[1], Stephanie A. Brito, BS[1], Mengyu Liu, MS[1], Chih-Ping Chou, PhD[1], Lourdes Baezconde-Garbanati, PhD, MPH, MA[1], Susana Ramirez, PhD, MA[2], Mary Ann Pentz, PhD, MA[1]

[1]University of Southern California, Department of Preventive Medicine, Institute for Health Promotion and Disease Prevention Research, Los Angeles, CA; [2]University of California, Merced, Public Health Communication, Merced, CA

Background: This pilot study aims to address health disparities research on chronic disease prevention in low-income Hispanic/Latino families with children under the age of five. Agency leaders were randomly selected from a larger list of health care agency directors and providers who are charged with delivering evidence-based prevention programs as part of the California First Five Initiative in counties that include a focus on vulnerable populations in urban and rural communities in Southern and Central California, respectively. The main objective was to learn about their ideas and experiences in an effort to determine how to best engage and keep such families enrolled in health programs. **Methods:** Two members of the research team conducted phone interviews from July–September 2016. One member facilitated the phone interviews, while another recorded the responses in separate, de-identified Word documents for qualitative analysis in ATLAS.ti. Interview questions sought to assess the perceived usefulness of 12 different health programs that are either already part of the California First Five Initiative or are being considered on a pilot basis. The response rate was 100% for all organizations interviewed. Both team members then analyzed key words and phrases in all interviews for each of the nine questions. In order to assess inter-rater reliability, kappa coefficients were computed across all participants (N=24) for each interview question. A score of 0.8 was used as a cutoff to demonstrate high agreement. The kappa coefficients for questions 1-9 ranged from 0.8042-1.0 with a total kappa coefficient of 0.9356. **Results:** 13/24 (54.2%) agency leaders were from rural communities, while 11/24 (45.8%) were associated with urban environments. **Conclusions:** Of the 12 health programs, these 5 garnered the most support: 14/24 (58.3%) endorsed working together in groups to improve access to health programs; 12/24 (50%) endorsed discussing family health needs at home with a promotora (i.e., a trained person from the community); 11/24 (45.8%) endorsed taking 10 minutes a day to do easy physical activity at home; 12/24 (50%) endorsed learning about ways to relax and reduce stress for mothers; and 13/24 (54.2%) endorsed assisting mothers with family weight management and infant eating. Increased implementation of such

health programs is likely to reduce health risk behaviors (e.g., sedentary behavior, low physical activity, and poor nutrition).

THE IMPACT OF CUMULATIVE RISK ON ASTHMA OUTCOMES IN CHILDREN AND ADOLESCENTS LIVING IN AN URBAN ENVIRONMENT

Samantha A. Miadich, M.A. [1], Jeremy Barsell, B.S.[1], Lariel V. Turner, Student[2], Robin S. Everhart, PhD[1]

[1]Virginia Commonwealth University, Richmond, VA; [2]Viriginia Commonwealth University, Hopewell, VA

Objective: Children and adolescents with asthma from low-income, urban families are more likely to experience high levels of stress, which can further compound their risk for poor asthma outcomes. A cumulative risk model may be a more accurate depiction of how risk factors impact health outcomes in that risk exposures do not occur in isolation. This ongoing study investigated the association between a cumulative risk model (comprised of poverty, caregiver stress, family functioning, child discrimination, neighborhood stress) and child asthma outcomes (quality of life [QOL], asthma control, functional severity, quick-relief medication use). This study also assessed whether the cumulative risk model was a stronger predictor of asthma outcomes than a single risk exposure.

Methods: Participants included 94 children/adolescents (64% male) with asthma 7-17 years of age (*M*=11.85 years, *SD*=2.86) and their primary caregivers (92% African American). Children and caregivers completed questionnaires at an initial research session.

Results: The cumulative risk model significantly predicted child QOL (R^2=.17, $F(1,93)$=18.54, $p < .001$),), asthma control (R^2=.09, $F(1,93)$=9.35, p=.003), functional severity (R^2=.06, $F(1,93)$=6.09, p=.015), and quick-relief medication use (R^2=.08, $F(1,93)$=7.95, p=.006). Higher cumulative risk indices were associated with worse asthma outcomes. Additionally, the cumulative risk model predicted QOL above and beyond any single risk factor. However, the cumulative risk index was not a stronger predictor than neighborhood stress when assessing functional severity, quick-relief medication, and asthma control. In addition, it was not a stronger predictor than poverty when assessing functional severity and quick-relief medication use.

Conclusions: Findings suggest that an accumulation of stress related to urban living may be associated with poorer QOL, worse asthma control, worse functional severity, and more quick-relief medication use in children and adolescents with asthma. Healthcare providers and clinicians may need to focus on family-based strategies that reduce the accumulation of stress

to improve child asthma outcomes. Future research is also needed to further examine the independent impact of neighborhood stress and poverty on asthma outcomes, as these factors were found to be most robust in associations with several asthma outcomes (e.g., functional severity, quick-relief medication use).

TRAJECTORIES OF WEIGHT FOR LENGTH GROWTH FOR INFANTS DURING THE FIRST YEAR OF LIFE

Andrea Lopez-Cepero, BS, MHSN, Lisa Nobel, MSc, Tiffany A. Moore Simas, MD, MPH, MEd, FACOG, Milagros C. Rosal, PhD

University of Massachusetts Medical School, Worcester, MA

Background: Childhood obesity is a major public health problem. Studies of patterns of child growth contributing to the development of obesity are scarce, particularly in infancy. Group-based trajectory analyses among infants are a novel procedure that may help characterize subgroups of infants with similar longitudinal growth profiles.

Objective: To identify trajectories of weight for length growth during the first year of life.

Methods: Subjects were singleton infants and their mothers (N=90 mother-infant pairs) who participated in the Pregnancy and Postpartum Observational Dietary Study. Women completed assessments throughout their infant's first year of life and included socio-demographic characteristics and feeding behaviors. Infant weight for length measures from birth to 12 months were abstracted from pediatric office records. Weight for length percentiles were calculated according to the World Health Organization guidelines for infants. Group-based trajectory analysis was done to identify subgroups of infants with similar growth profiles.

Results: Infants were from mother’s with average of 28 years (SD=5.2), 70.0% White, 60.0% high-school educated and 63.2% had two or more children. Over half of mothers introduced solid foods to their infants by 6 months of age (63.2%) and about one third self-reported breast feeding at 12 months post-partum (31.9%). Three growth trajectories were identified: a low and stable growth group (38.3%), a rapid growth group (35.0%) and a moderate growth group (26.7%). Maternal and feeding variables were all similar across the three infant growth trajectory groups (p>0.05).

Conclusion: Trajectory models suggested three patterns of infant growth. If replicated, future studies can help identify and subsequently target modifiable risk factors associated with rapid infant growth trajectories.

A QUANTITATIVE STUDY OF THE INTEGRATION OF YOGA IN NATURE

Zachary J. Bertone, Ph.D.

Naval Medical Center San Diego, Coronado, CA

A Quantitative Study of the Integration of Yoga in Nature

Objective: Current trends of ubiquitous technology use and significant immersion in artificial urban environments may be significantly impacting the health of individuals through a disconnection from both nature and the human body. As alternatives, this quantitative study examined the practice of yoga and immersion in nature settings as a means to facilitate greater physical, psychological, spiritual health, and embodiment.

Method: A pre and posttest design was conducted in a sample of adults recruited from the Silicon Valley, CA. The following measures were collected: Body Awareness Questionnaire (BAQ), Spiritual Well-Being Scale (SWBS), Quality of Life Questionnaire (QLQ), Exercise Induced Feeling Inventory (EFI), and blood pressure and salivary cortisol (both obtained once pre- and post-test). Participants were assigned to one of three groups that engaged in weekly 90 minute activities for six sessions over an 8-10 week period. The experimental group practiced yoga in a nature setting; the primary control group hiked in a designated nature area; and the secondary control group practiced yoga in an indoor facility. Repeated measures ANOVA and t-tests were used for analyses.

Results: A well-educated, racially diverse sample (2.3% African American; 27.3% Asian; 45.5% Caucasian; 11.4% Hispanic; 4.5% Middle Eastern; 2.2% Native American; 6.8% Other) of 44 participants (15 men; 29 women) enrolled. Within subject effects for EFI 1 scores for the sample as a whole emerged significant. EFI 6 emerged as significant within groups with higher mean scores for the Outdoor and Studio yoga group. Repeated measures analysis of variance (ANOVA; $p < .05$) of all self-report measures did not find significant effects for BAQ, SWBS, QLQ, cortisol, and blood pressure assessments. A paired t-test found only significant decreases in diastolic blood pressure effects for the full sample.

Conclusions: This study is the first to quantitatively explore potential differences between indoor and outdoor yoga and the embodied effects of yoga in an outdoor environment. Results support findings in previous research on overall physiological health benefits of exercise and exercise differentiation literature that shows the benefits of yoga over other exercise modalities.

AN EXPLORATION OF SHAME, SPIRITUAL PRACTICES, AND COMPASSION IN A COMMUNITY-BASED GROUP

Gillian D. Grannum, MA, MDiv[1], Alexis D. Abernethy, PhD[2], David Allen, Director[3]

[1]Graduate School of Psychology, Fuller Theological Seminary, Pasadena, CA; [2]Travis Research Institute/ Fuller Theological Seminary, Pasadena, CA; [3]Renascence Institute International, Ft . Lauderdale, FL

Psychological research has explored the maladaptive role of shame in contributing to poor self-image, impaired relationships, and psychopathology. Compassion-focused individual and group therapy has demonstrated effectiveness in repairing shame through increasing self-acceptance and empathy. Culturally-tailored group interventions, which may include spiritual practices, may help to mitigate the effects of maladaptive responses to shame, particularly within communities that have experienced societal fragmentation. The present study explored how engaging in spiritual practices within a community-based group may be related to transformation and the alleviation of shame. Semi-structured interviews were conducted with 16 members of "The Family: People Helping People," a Bahamas-based group resocialization program. Thematic analysis of data was conducted using Interpretive Phenomenological Analysis and themes were coded with NVivo 11 software. A total of 54 themes were identified and cluster analyses were conducted to assess relationships between themes based on word similarity. Participants noted that prayer enhanced their group experience and helped to foster group cohesion and an environment of increased compassion for others. In addition, group-related factors (particularly interpersonal elements such as connectedness to group and learning from or teaching other members) were prominent in participants' description of transformation and decreased shame. Compassion for others was significantly more prevalent than self-compassion; this finding may reflect the unique characteristics of the cultural context. Research findings indicate that culturally congruent spiritual practices, including prayer and musical expression, may contribute to restoring healthy intrapersonal and interpersonal functioning. This research offers support for a holistic approach to addressing shame that incorporates psychological, social, and spiritual dimensions.

ASSESSING THE KENTUCKY INVENTORY MINDFULNESS SCALE: A COST EFFECTIVE TOOL FOR HOSPITALS?

Rubi Gonzales, B.A[1], Juliana Cardoso, M.A[2], Craig Field, PhD, MPH[3]

[1]University of Texas at El Paso, El paso, TX; [2]University of Texas at El Paso, El Paso, TX; [3]Latino Alcohol and Health Disparities Research (LAHDR) Center, Department of Psychology, The University of Texas at El Paso, El Paso, TX

According to the Centers for Disease Control and Prevention (2012), 117 million people suffer from chronic health conditions and one of four individuals has two or more conditions. These conditions are common and most importantly preventable; they include heart disease, diabetes, obesity, stroke, and arthritis. Several treatments are available for theses illness but such treatments can be a financial burden for the patients. In 2010, approximately 90% of health care spending was allocated to individuals with more than one chronic illness.

Mindfulness may be defined as a psychological state of awareness of experience without judgement. Research has demonstrated several benefits to mindfulness, such as reducing rumination (Chambers et al., 2008), reducing stress (Hoffman et al., 2010), improving working memory (Jha et al., 2010), and reducing emotional reactivity (Orthner et al., 2007). The literature has established several benefits; however, limited research has been conducted on patients in a hospital setting. According to Johansson et al. (2012), a mindfulness base stress reduction treatment significantly improved self-report for mental fatigue on neuropsychological tests in patients who suffer from mental fatigue after a stroke or traumatic brain injury. Furthermore, Tsafou et al. (2016) reported satisfaction as a mediator on the effect of mindfulness on physical activity.

The present study investigated the psychometric properties of the Kentucky Inventory Mindfulness Skills (KIMS) scale by Baer, Smith, & Allen, 2004 from an online sample (N=601). A Principal Component factor analysis was conducted and indicated multidimensionality with 7 factors. Cronbach's Alpha coefficient was .789 and Spearman-Brown coefficient of .794, indicating good reliability. A chi-square test of goodness-of-fit was performed to determine whether there is a difference between the distributions χ^2 (458, N=601)=785.091, p=.000. The average age of participants was 38.64 (*SD*= 15.329).

Given the lack of research of mindfulness in clinical settings, one crucial future direction is to assess the psychometric properties of the scale for hospital setting patients. The KIMS may serve as a potential cost effective tool for health care providers as a measure of mindfulness strategies in patients; more specifically, such identification may facilitate the development of specific mindfulness techniques to reduce negative patient health outcomes.

BODY-MIND-SPIRIT GROUP THERAPY FOR CHINESE MEDICINE STAGNATION SYNDROME - RCT WITH SELF-REPORT AND PHYSIOLOGICAL MEASURES

Siu-man Ng, PhD

The University of Hong Kong, Pokfulam, N/A, Hong Kong

Chinese medicine diagnosis stagnation syndrome is characterized by mind-body obstruction-like symptoms such as repressed emotions, feeling stomach clogged, something obstructing throat and heavy head. Its emphasis on somatic symptoms makes it a socially legitimate health condition for adults in distress to seek help. Stagnation syndrome is common, with a point-prevalence at 6.2% revealed in our epidemiological study. Our previous studies have also operationalized stagnation as a construct useful to all mental health practitioners, and piloted a 6-session group therapy for stagnation syndrome grounded on a body-mind-spirit intervention model. The current randomized controlled trial aims to further rigorously evaluate the efficacy of the manualized intervention. Totally 126 participants were recruited and randomly assigned to either treatment or control group. Outcomes were measured at pre, post and 2 months after intervention, and evaluated by self-report scales and salivary cortisol level. Repeated measures ANOVA revealed significant superiority of treatment over control groups in self-report measures and mean cortisol level, mostly at moderate effect size. Regarding diurnal slope of cortisol level, changes were nonsignificant. The findings provide evidence supporting the efficacy of the body-mind-spirit group therapy, which actualizes the holistic tradition of Chinese medicine in modern health practice. Evaluating the stagnation concept and group intervention in other cultures is worth pursuing.

DIVERSE WOMEN'S PERSPECTIVES ON MIND-BODY PRACTICES THROUGHOUT PREGNANCY AND BEYOND

Patricia Kinser, PhD, WHNP-BC, RN, FNAP[1], Nancy Jallo, PhD, FNP, WHNP, CNS[2]

[1]Virginia Commonwealth University School of Nursing, Richmond, VA; [2]Virginia Commonwealth University, Richmond, VA

Background: Unmanaged perinatal stress poses public health concerns for maternal, child, and family health. Pregnant and postpartum women who experience high levels of psychosocial stress are at risk of substance use, poor spousal relationships, suicidality, poor maternal-fetal/child attachment, and poor maternal self-efficacy. The prevalence and long-term negative effects of stress on the well-being of the mother, fetus, and child during the perinatal continuum underscores its importance as a public health problem. Because maternal stress and the associated negative symptoms of depression and anxiety are potentially modifiable, addressing maternal stress during this critical time may signify one of the most feasible strategies for improving the health and well-being of women, infants, and children. Mind-body interventions are often used for managing stress and depressive symptoms in pregnant women.

Purpose/Methods: The purpose of this presentation is to report recent research about diverse women's interest and participation in mind-body interventions for stress and depression in the perinatal period. Focus groups and interviews with pregnant and postpartum women were conducted to evaluate the feasibility and acceptability of mind-body practices, such as guided imagery (GI) and yoga, for stress and depressive symptom management during pregnancy and in the postpartum period.

Results: Black, White, and Hispanic women who participated in the interviews and focus groups (n=25) reported that stress and depressive symptoms are pervasive in their lives and in their community and consistently expressed a strong interest in mind-body practices. Women who participated in GI (n=15) reported less stress and anxiety with increased feelings of calmness, peace, and sense of coping. Women who participated in yoga (n=12) as an aspect of group prenatal care expressed great satisfaction with the ease of access and the community-support involved in the prenatal yoga sessions.

Conclusions: This study suggests that diverse women experience significant levels of stress, anxiety, and depressive symptoms during their pregnancies and that a mind-body intervention may be helpful for coping with stress and minimizing its negative effects. These

findings are relevant to healthcare providers and researchers who should continue to focus on the unique needs of pregnant women, particularly when designing prevention and intervention strategies regarding stress and depressive symptoms.

EXPLORING THE RELATIONSHIP BETWEEN SELF-ESTEEM AND SPIRITUALITY IN PATIENTS WITH EATING DISORDERS

Andrene Spencer, MA[1], Alexis D. Abernethy, PhD[2], Kallie Kobold, MA[3]

[1]Fuller Theological Seminary, South Pasadena, CA; [2]Travis Research Institute/ Fuller Theological Seminary, Pasadena, CA; [3]Fuller Theological Seminary, Pasadena, CA

Studies have shown that there is a relationship between spirituality and positive health outcomes for people with eating disorders (EDs). Low self-esteem is one of several risk factors for EDs. For ED patients, the relationship between self-esteem and spirituality is not well understood. The present study sought to examine the relationships among self-esteem, spirituality, and disordered eating. Drawing from a parent study of 390 participants, qualitative responses from a subsample of 150 adult and adolescent patients who were treated for an ED at various treatment centers in either residential, partial, or intensive outpatient programs were examined. Patients responded to two open-ended qualitative questions about identity and future orientation. Interpretive phenomenological analysis (IPA) was utilized to identify themes from both questions taken at admission and discharge. NVivo11, a qualitative analysis software, was used to conduct cluster analyses. A dendrogram is a type of cluster analysis where themes that are similar based on word usage are clustered together on the same branch and those that are different are further apart. Self-esteem themes included low self-worth and a strong sense of self. Spirituality themes included religious comfort and religious strain. Eating disorder themes included recovery/health and symptom/problem focused. Themes associated with religious strain were related to low self-worth and symptom/problem focused while themes associated with religious comfort were related to recovery/health. These findings suggest that patients who described their relationship with God in a negative way seemed to focus more on their eating disorder diagnosis and had a negative view of themselves. Those who described their relationship with God or a higher being in a positive way tended to have a more positive outlook on life. An unexpected finding was the shared similarity between strong sense of self and low self-worth. Responses that were coded as indicating a strong sense of self captured the more positive aspects of self-esteem as well as a strong sense of identity. It is possible that the themes were similar since they both pertain to how patients see themselves (e.g., positive, negative, or neutral). These findings shed light on how one’s relationship with a higher being may be associated with self-esteem and disordered eating.

GENDER REPRESENTATION OF MINDFULNESS BASED CLINICAL TRIALS

Jamie Bodenlos, Ph.D.[1], Kathryn Strang, BA[2], Juliana M. Heffern, B.S. Psychology[3], Kathryn Lyle, N/A[2], Brien Ashdown, Ph.D.[2], Rosalind Gray-Bauer, Bachelor of Arts [4]

[1]Hobart and William Smith Colleges, Baldwinsville, NY; [2]Hobart and William Smith Colleges, geneva, NY; [3]Hobart and William Smith Colleges, Geneva, NY; [4]Hobart and William Smith Colleges, Braintree, MA

Mindfulness-based treatments for psychological disorders and health issues have become mainstream. Studies have confirmed the efficacy of treatments for a wide array of disorders; however, it’s unclear if these treatments work as well in males as they do in females. According to the Evidence Based Practice in Psychology model, it’s important to have support for the use of a treatment in the population you plan to treat. In order to understand how well males have been represented in the mindfulness based literature, we conducted a systematic review of the published randomized clinical trials testing either Mindfulness-Based Stress Reduction (MBSR) or Mindfulness-Based Cognitive Therapy (MBCT). We reviewed 120 articles (*M* number of participants per article = 87.72, *S.D.* = 75.08). MBCT was used in 68 (56.6%), MBSR was utilized in 51 of the articles (42.5%), and one article utilized both types of interventions (0.9%). Of the 10,526 total participants, males accounted for less than a third and only 35% of the articles made it clear that they included ethnic minority participants. These findings suggest that studies which focus on mindfulness based interventions among males is needed to ascertain the efficacy of these interventions in this group.

HIGH FAITH VS. NO FAITH: MORE EVIDENCE OF A CURVILINEAR RELATIONSHIP BETWEEN RELIGIOSITY AND HEALTH

R. Brian Giesler, PhD, Natalie Nusinow, BA, Shelby Eaton, BA

Butler University, Indianapoils, IN

Although positive linear associations between religiosity and physical health have frequently been found in previous research, our recent work with younger adults suggests that these two variables may be better characterized as being related in a curvilinear fashion. To assess whether curvilinearity is present in older adults, a sample of residents (mean age=85, *sd*=5.4, *n*=113) from a retirement community in a large Midwestern city were recruited to take part in a cross-sectional survey study. Health was assessed through self-report measures used in prior work, including: 1) a current symptom count, 2) a comorbidity count, 3) a single, Likert type item assessing general health, 4) a single item assessing pain, and 5) a single item assessing fatigue. Religiosity was assessed using a modified version of Hoge's (1972) religious commitment scale, a validated measure of intrinsic religiosity. As predicted, curvilinear relationships were found across most of the individual measures of health. When individual measures were combined into a global measure of health (Cronbach's alpha = .81), a significant curvilinear relationship was again found ($p = .005$, $R^2=.09$), such that the most religious and the most secular reported the highest levels of health. To investigate this relationship further, participants were categorized into five groups by level of religiosity. A repeated measures ANOVA, with health measure as the repeated factor, indicated marginally significant differences across the groups ($p < .08$): highly religiously committed individuals tended to show the best health (i.e., fewer symptoms, better self-rated health, etc.), and health declined as commitment decreased. However, this downward trend was broken by individuals who were not at all committed (i.e., secularly oriented individuals), who reported relatively high levels of physical health that most closely approximated those of the moderately religiously committed. This curvilinear relation between health and religiosity may have been missed in the past because analyses assuming linearity have generally been employed in this context. However, across all groups, the most highly religious still appear to enjoy the highest levels of physical health.

IMPLEMENTATION OF AN INTEGRATIVE CARE CENTER IN AN NCI DESIGNATED ACADEMIC CANCER CENTER

Sarah Braun, MS[1], Masey Ross, MD, MS[2], Carrie Cybulski, BA, PMP[3], Mary Ann Hager, MS, CHPN[3], Tara A. Albrecht, PhD, ACNP-BC[4]

[1]Virginia Commonwealth University, Richmond, VA; [2]Virginia Commonwealth University Health System, Richmond, VA; [3]VCU Health, Richmond, VA; [4]Virginia Commonwealth University and Massey Cancer Center, Richmond, VA

Purpose: Oncology patients and survivors report increased use and interest in integrative practices, including meditation, diet, yoga, and more. Research supports the use of integrative practices as complementary to conventional medicine for the improvement of physical and psychological symptoms for patients with cancer. However, the implementation of an Integrative Health Program in an academic and NCI designated Cancer Center within a safety net hospital is not without challenges. Therefore, we will document the processes implemented and challenges encountered over the past two years, and discuss future directions as we work to develop an integrative health program in our NCI designated Cancer Center.

Methods: An Integrative Health committee was created within the NCI designated Cancer Center comprised of an interdisciplinary team of healthcare providers, administrators, and professional practitioners trained in integrative practices. Over the past two years, the steps to meet the aims for program initiation included development of a conceptual framework, research initiatives, resource management, and the conduction of a SWOT (strengths, weaknesses, opportunities, threats) analysis and a needs assessment of both patients/survivors and health care providers.

Results: Results from monthly meetings and subgroup initiatives of the Integrative Health committee are discussed including the four pillars identified in the mission statement (Cancer Rehabilitation, Mind/Body, Psychosocial, Nutrition), program development, creation of a business plan to address challenges specific to our cancer center, and future directions based on the results of our needs assessments.

Conclusion: Discussion of the early development of an Integrative Health Program will include resource discovery, creation of a mission statement and conceptual framework, interpretation

of the SWOT analysis and needs assessments, and marketing development. Important lessons for future directions include the need for interdisciplinary and interdepartmental collaboration, patient-centered care, informed providers, and a well-developed business plan. Successes, challenges, and specific plans for the future are discussed within the context of an NCI designated Cancer Center in a safety net hospital.

RELIGION, PHYSICAL ACTIVITY, AND FAT INTAKE

Karen Yeary, PhD, Page Moore, MS, PhD

University of Arkansas for Medical Sciences, Little Rock, AR

A substantial body of literature has documented religion's association with health, and health behaviors have been hypothesized as a sizeable mediator in the religion-health relationship. Few studies have examined the potential role of physical activity and nutrition in religion's association with health over time. Also, a limited number of studies have examined religion's relationship with health behaviors in underserved populations.

Secondary data analyses using a preexisting data set were conducted to explore associations between religion, physical activity, and fat-intake among African American adults. The data set (n=26) was from a single-group pre-posttest study that examined the feasibility of an evidence-based, 16-week behavioral weight loss intervention. Total physical activity (Paffenbarger), recreational physical activity (Paffenbarger), fat-intake (NCI Quick Food Scan), religious attendance, private religiosity, daily spiritual experiences, religious social support, religious coping, perceived sacredness of the body, religious locus of control, and demographics were assessed at baseline and 16-week follow-up. Linear regression analyses were used to explore the relationships between religion, physical activity and fat intake after controlling for demographic variables (gender, age, employment, marital status, education, and income) and BMI.

At baseline, there was a statistical trend between anticipated religious support and higher total physical activity (adjusted β =7.7, SE=3.5; $p < .10$), negative religious coping and higher fat intake (adjusted β=2.6, SE=1.3; $p < .10$), and private religious activity and lower fat intake (adjusted β=-7.7, SE=4.0; $p < .10$). Positive religious coping at baseline (adjusted β=7.2, SE=1.7; $p < .05$), God locus of control at baseline (adjusted β=2.0, SE=0.50; $p < .05$), and church attendance at baseline (adjusted β=26.4, SE=1.8; $p < .05$) were each significantly associated with greater total physical activity from baseline to 16-week follow-up. Positive religious coping at baseline (adjusted β=4.4, SE=6.6; $p < .05$), religious social support given at baseline (adjusted β=5.2, SE=0.82; $p < .05$), and church attendance at baseline (adjusted β=13.3, SE=3.1; $p < .05$) were each significantly associated with greater recreational physical activity from baseline to 16-week follow-up.

Religion may be involved in shaping physical activity among African Americans attempting to lose weight.

THE EFFECTS OF YOGA ON ADULTS WITH TYPE II DIABETES: A SYSTEMATIC REVIEW

Herpreet Thind, PhD, MPH, MBBS[1], Lori A. J. Scott-Sheldon, PhD[2], Ryan Lantini, MA[3], Brittany L. Balletto, BS[4], Marissa Donahue, M.A Candidate[3], Melissa M. Feulner, BS[5], Elena Salmoirago-Blotcher, M.D., Ph.D.[6], Beth C. Bock, PhD[7]

[1]University of Massachusetts Lowell, Lowell, MA; [2]The Miriam Hospital and Brown University, Providence, RI; [3]The Miriam Hospital, Providence, RI; [4]The Miriam Hospital, Cranston, RI; [5]The Miriam Hospital, Milford, CT; [6]The Miriam Hospital & Alpert Medical School of Brown University, Providence, RI; [7]Brown Medical School, Providence, RI

Objective: The purpose of this systematic review was to examine the effects of yoga for glycemic control among adults with type II diabetes.

Methods: Comprehensive electronic databases searches located 2,556 unique studies with relevant key terms; of these, 21 studies met inclusion criteria. Studies were included if they a) evaluated a yoga intervention to promote type II diabetes management, b) used an objective measure to assess glycemic control at post-intervention, and c) were available through December 2015. Studies were excluded if yoga was not the primary intervention focus (e.g., if yoga was part of a mindfulness-based intervention). Independent raters coded participant, design and methodological characteristics and intervention content. Within- and between-group changes in glycemic control were assessed.

Results: Studies were published between 1992 and 2015; samples included 2,402 participants (*M* age = 54 years; 43% women). Most studies (17) were conducted in India; 2 were conducted in England, 1 in Cuba, and 1 in Iran. Treatment as usual was the most common (15) control condition; 3 studies used a diabetes education and 3 used an exercise comparison condition. Interventions were typically conducted over a median of 50 sessions; mean duration of intervention was 11 weeks. Only five studies reported the style of yoga used in the intervention (3, Hatha Yoga; 2, Iyengar). Within-group glycemic control improved at post-intervention among participants exposed to the yoga intervention but between-group findings compared to comparison group were mixed. Overall, studies satisfied an average of 42% of the methodological quality criteria indicating poor to moderate quality.

Conclusion: Yoga improved glycemic control in adults with type II diabetes from pre- to post-intervention but the findings were mixed when yoga was compared to a control condition.

Future studies using more rigorous designs with detailed reporting of methodology are needed to determine the potential benefit of yoga for adults with type II diabetes.

Learning Objectives:
1) Describe the efficacy of yoga interventions for improving glycemic control for type II diabetes.
2) Identify the gaps in research on the use of yoga for adults living with type II diabetes.

USE OF TRADITIONAL MEDICINES TO COPE WITH CLIMATE-SENSITIVE DISEASES IN A RESOURCE POOR SETTING IN BANGLADESH

Md Aminul Haque, PhD

University of Dhaka, Dhaka, Dhaka, Bangladesh

Background
This study aims to explore the use of traditional medicines to cope with climate sensitive diseases in areas vulnerable to climate change. We assessed the extent to which traditional or alternative medicines were used for the treatment of the climate sensitive diseases by villagers as part of their health-coping strategies.

Methods
The study deployed a mixed-method research design to know the health-coping strategies of the people in a resource-poor setting.

A cross sectional study was conducted from September 2010 to March 2011 among 450 households selected randomly in the districts of Rajshahi and Khulna, Bangladesh. The elder males or females of each household were interviewed. For qualitative methods, twelve focus group discussions (six with females and six with males) and fifteen key informant interviews were conducted by the research team, using interview guidelines on the use of traditional medicine.

Results
Univariate analysis showed that the use of traditional medicines has increased among community members of all socio-economic and demographic backgrounds. Due to the increased incidence of disease and sickness respondents had to increase the use of their cultural means to cope with adverse health situations.

Conclusions
A systematic collection of knowledge on the use of traditional medicines to cope with climate-sensitive diseases can help the adaptation of communities vulnerable to climate change. In addition it can be instrumental in creating a directory of traditional medicine components used for specific diseases and highlight the effectiveness and relevance of traditional medicines as health-coping strategies. This may be useful for policymakers, researchers, and development partners to adapt existing health care policy in resource-limited contexts. It may also encourage WHO, national and international institutions, such as pharmaceutical

companies, to carry out research investigating the effectiveness of these traditional medicines and integrate them with modern medicine. Overall, it could increase the health coping capacity of people in a resource-poor setting and contribute to their adaptation capabilities.

ASSESSING COMMUNITY MEMBERS' PREFERENCES OF A FAMILY-BASED DIABETES PREVENTION PROGRAM IN RURAL ALABAMA

Alexandra Khodadadi, B.A. [1], Susan Andreae, PhD, MPH[2], Andrea Cherrington, MD MPH[3]

[1]University of Alabama at Birmingham, Auburn, AL; [2]University of Alabama at Birmingham, Birmingham, AL; [3]University of Alabama at Birmingham, Division of Preventive Medicine, birmingham, AL

INTRODUCTION: Developing strategies to engage all family members in a lifestyle management program may be a promising strategy to improve the health of families living in rural underserved communities in Alabama.

OBJECTIVES: The aim of this study was to better understand barriers and facilitators in engaging the entire family in a family-centered diabetes prevention program.

METHODS: Five focus groups were held in 2016 in a rural, southern Alabama community with community members who had diabetes or cared for a family member with diabetes. Of the 58 focus group participants, 50 were women, 41 were over the age of 50, 53 had graduated from college or high school, and 16 worked full or part time. Participants were asked to discuss their current beliefs about diabetes and obesity and ideas on how to involve all family members in lifestyle changes. Focus group findings were analyzed by two coders using open coding.

RESULTS: Several themes emerged indicating family centered programs would be feasible and acceptable including: high levels of family cohesion, health information shared among family units and neighbors, and the desire for acquiring health knowledge and skills necessary for healthy lifestyles as a family unit. Potential barriers included the limited availability of community level resources, busy schedules, and multiple competing demands. Individual level barriers included stress and chronic pain in some family members.

CONCLUSIONS: With multiple generations living close by and a strong sense of family, a family based intervention would be relevant and feasible in this community. However, several barriers will need to be considered in order to achieve a culturally relevant lifestyle intervention applicable to the whole family.

LINKS OF COMMUNAL COPING TO MOOD AND SELF-CARE BEHAVIOR IN TYPE 2 DIABETES: A DAILY DIARY STUDY

Melissa Zajdel, M.S.[1], Vicki Helgeson, PhD[1], Howard Seltman, M.D., PhD[1], Mary Korytkowski, M.D.[2], Leslie Hausmann, PhD[3]

[1]Carnegie Mellon University, Pittsburgh, PA; [2]University of Pittsburgh, Pittsburgh, PA; [3]VA Pittsburgh Healthcare System, Pittsburgh, PA

Communal coping in the context of couples coping with chronic illness reflects the extent to which the illness is perceived as a shared problem and couples collaborate to manage the illness. We sought to determine how communal coping is related to adjustment to chronic illness in terms of daily mood and daily self-care behaviors. We conducted a daily diary study of 125 couples in which one person was recently diagnosed with type 2 diabetes (< 3 years). Patients were 59% white, 55% male, with a mean age of 54 years. Patients and partners completed questionnaires separately at the end of each day for 14 days, with an average completion rate of 10 days. Days were nested within individuals, and within-person communal coping and between-person communal coping values were created so that the between subject variance could be statistically controlled in all analyses. Therefore, within-person communal coping on any given day reflects the amount that an individual deviates from his or her average level of communal coping. Patient daily communal coping was related to higher levels of happiness ($\beta = .12$), lower levels of anger ($\beta = -.16$), higher levels of dietary adherence ($\beta = .27$), and higher levels of medication adherence ($\beta = .41$; all p's $< .05$) for patients. Partner communal coping was also related to patient outcomes, specifically higher patient happiness ($\beta = .10$), dietary adherence ($\beta = .10$), and medication adherence ($\beta = .38$; all p's $< .05$). When patient and partner communal coping were entered into the same equation to predict patient outcomes, patient communal coping emerged as the stronger and more robust predictor. Partner communal coping was related to their own mood – higher happiness ($\beta = .21$), lower anger ($\beta = -.15$), and lower depressed mood ($\beta = -.13$; all p's $< .05$). These results suggest that communal coping on a daily basis is linked to enhanced mood among both patients and partners as well as better patient self-care behaviors.

A COMPREHENSIVE PATIENT NAVIGATOR PROGRAM FOR DIABETES PATIENTS LIVING IN RURAL APPALACHIA

Liz A. Beverly, PhD

Ohio University Heritage College of Osteopathic Medicine, Athens, OH

In the Appalachian region of rural southeastern Ohio, diabetes rates are 30%-40% higher than the national averages. Thus, strategies that complement standard medical interventions are critically important to mitigate the risk of complications and reduce the economic burden of the disease. The Comprehensive Patient Navigation Program for Rural Appalachia is designed to improve health outcomes (e.g., glycemic and blood pressure control; reduced depression, distress) and lower health care expenditures (e.g., reduced admissions, readmissions, and emergency department utilization) for individuals with type 2 diabetes through the development and coordinated implementation of a Diabetes Patient Navigator and Medical Legal Partnership (MLP). To date, 35 patients (mean age=60±13 years, A1C=8.9±2.4%, 61% female, 100% white) have received navigation and/or MLP services. Qualitative interviews and baseline surveys revealed the following diabetes management barriers: mental health issues, food insecurity, lack of insurance coverage, unemployment and/or disability, limited or no transportation, housing issues, limited finances, and other legal issues (e.g., custody rights, divorce). Navigation and MLP services have resulted in increases in insurance coverage (n=13), Social Security Extra Help (n=9), food stamps (n=7), reduced hospital bills (n=6), permanent or temporary housing (n=5), diabetes supplies at no cost (n=5), and utility repairs (n=5). Only two patients were hospitalized at follow-up and no patients utilized the emergency department. Eleven patients demonstrated improvements in diabetes self-care at 6-month follow-up; A1C values are currently being collected. Preliminary findings suggest that diabetes patients living in rural southeastern Ohio benefit from a combination of patient navigation and legal services.

¿LISTOS CON LISTAS? EVALUATING WHETHER SPANISH-SPEAKING PATIENTS WHO BRING A LIST A QUESTIONS FOR THE DOCTOR GET THEM ANSWERED.

Iridian Duran, N/A[1], Adriana Orellana, N/A[1], Brett Cervantes, N/A[1], George Heredia, A.S.[1], Karina Galvan-Martinez, N/A[2], Karla Garcia, B.S.[1], Herlinda Guzman, B.A.[1], John Billimek, Ph.D.[1]

[1]University of California, Irvine, Irvine, CA; [2]Health Policy Research Institute at UCI, Irvine, CA

Type 2 diabetes negatively impacts the underserved low-income Hispanic community, giving rise to inadequate guidance for the proper plan of care due to ineffective communication. The disconnect between patients and their physicians may lead to medication non-adherence and poor health outcomes. A proposed solution to improve physician-patient communication is to prepare patients with a set of questions to ask during their visit. Bringing a list of questions to medical visits could facilitate communication between the physician and patient. For this study, community health workers (CHW) assisted patients in determining three questions to bring for their medical visit. The patients then wrote a list of important questions they wanted to discuss with their physician. The medical visit was audio recorded from the entrance of the physician until the encounter was completed. The recordings were then transcribed and coded by selected audio-coders. Data from the audio recordings were analyzed and compared to determine if the patients asked their questions and if the physician answered them. The data indicated that in 49.1% of visits physicians made reference to or read questions from the patient's question list. Overall, 57 recordings were audio coded with an average of 2.7+0.6 questions written down, out of those, an average of 2.3+0.8 questions were asked by patients and an average of 2.2+0.9 questions answered by the physician. A total of 64.9% (37 of 57) of patients asked all of the questions from their list, and all questions asked by the patient were answered by the physician in 82.5% of (47 of 57) visits. The results from this study suggest that preparing lists of questions prior to a doctor visit may be helpful to promote discussion of important health topics, but that many questions from the lists are never discussed with the doctor. Further research must be conducted to identify strategies to improve communication about these issues.

ASSOCIATION BETWEEN WEIGHT LOSS OUTCOMES AND PERCEIVED RISK OF TYPE 2 DIABETES AMONG PERSONS WITH PREDIABETES

Mona AuYoung, PhD, MS, MPH[1], Tannaz Moin, MD, MBA, MSHS[2], Laura Damschroder, MS, MPH[1], Caroline Richardson, MD[3]

[1]VA CCMR, Ann Arbor, MI; [2]VA Greater Los Angeles Healthcare System, David Geffen UCLA School of Medicine, Los Angeles, CA; [3]University of Michigan, Ann Arbor, MI

Theories such as the Health Behavior Model posit that perceived risk and perceived severity of health conditions are related to actual health behaviors. Previous studies have shown mixed results regarding perceived risk and health behaviors. Among chronic conditions, a previous study indicated diabetes is perceived to be less severe than conditions such as heart disease, breast cancer, and stroke. Another study found that those with higher perceived risk of diabetes were not more likely to intend to make healthy lifestyle changes. This study examines whether perceived diabetes risk is associated with weight loss after participating in a lifestyle management program.

Eligible Veterans with prediabetes were randomly selected into one of three arms of a pragmatic trial: in-person diabetes prevention program (DPP), online DPP, and a usual care weight management program (MOVE!). All three arms encouraged patients to lose weight, since this can reduce diabetes risk. The analytic sample included consented patients who completed baseline questionnaires and had 12-month weight outcomes available (either through clinical data sources or wireless scales). Participants rated perceived risk (chances of developing type 2 diabetes in their lifetime) and perceived severity (how much diabetes would affect their life if they were diagnosed) on Likert scales. Multiple linear regression analyses assessed the association between 12-month weight change and perceived risk and perceived severity, separately, controlling for sex, age, study arm, race/ethnicity, and baseline body mass index.

Survey respondents (n=376) had been diagnosed with prediabetes; the perceived risk of developing type 2 diabetes was fairly evenly distributed from low to high although perceived severity skewed towards high. There was no association between perceived risk or perceived severity and 12-month weight change, after controlling for covariates. This lack of association suggests that perceived risk and perceived severity of diabetes may not be sufficient to motivate weight loss to prevent diabetes.

[1]VA Harbor Healthcare System, New York, NY; [2]Veteran Affairs Medical Center, New York, NY; [3]Veterans Affairs New York Harbor Healthcare System, La Canada, CA; [4]New York Harbor Healthcare System, New York, NY; [5]VA NY Harbor Healthcare System – Manhattan Campus, New York, NY; [6]Veteran's Affairs Hospital, New York, NY; [7]Veterans Affairs Medical Center, Manhattan, NJ; [8]Veteran Affairs Medical Center - Manhattan, Manhattan, NY; [9]Department of Veterans Affairs, NY, NY

Objectives: Lower extremity amputation (LEA) is a devastating complication of diabetes with a mortality rate exceeding that of most cancers. LEA is preceded by foot ulcers in >80% of cases. We examined the challenges to enrolling participants in the context of a clinical trial to avert ulcer recurrence.

Methods: We identified patients with diabetes and a healed diabetic foot ulcer (DFU) through an electronic medical record search for patients with ICD-9 codes for diabetes and DFU. The previously healed DFU was confirmed through medical record review. Interested patients provided informed consent and underwent a formal screening. Descriptive statistics (numbers and proportions) illustrate our success in enrolling patients and provide reasons why patients were ineligible or not enrolled.

Results: From August 2015 to September 2016, we identified 334 patients from an electronic search and medical record review. Of these patients, 133 (41%) met ineligibility criteria such as: a current or recent DFU (n=42), an inability to ambulate without assistance (n=21), not currently taking medication for diabetes mellitus (n=10), lower extremity amputation (n=4), recent hospitalization or surgery (n=12), and other comorbidities such as cancer (n=6) and end-stage renal disease (n=2). Among the 201 eligible patients, 55 (27%) were enrolled. Common reasons for non-enrollment among the remaining patients (n=146)

include: temporarily not having the time to be screened (n=18, 12%), ineligibility after providing consent (n=17, 12%), hesitancy in committing to a long-term study (n=14, 10%), commitment to managing serious coexisting health conditions (n=14, 10%), not being interested in education (n=7, 5%), denial of DFU history (n=3, 2%), hesitancy due to unfavorable experiences with the hospital in the past (n=2, 1%), and travel concerns (n=2, 1%).

Conclusions: There are several challenges to recruiting patients with a previous foot ulcer. Most significantly, the electronic search identifies only a small number of patients and a large fraction of these patients have either a non-healed DFU or other serious coexisting conditions that lead to ineligibility. To improve recruitment and generalizability, recruitment strategies should consider developing a better electronic search, dedicating staff to reaching patients, enrolling participants with limited mobility, incorporating patients who are not taking medications, and motivating patients to participate in clinical trials.

COGNITIVE AND BEHAVIORAL PREDICTORS OF SOCIAL RESILIENCE AMONG ADOLESCENTS WITH TYPE 1 DIABETES (T1D)

Rebecca N. Adams, Ph.D.[1], Esti Iturralde, Ph.D.[1], Anthony T. Vesco, Ph.D.[2], Jill Weissberg-Benchell, Ph.D.[3], Korey K. Hood, Ph.D.[1]

[1]Stanford University School of Medicine, Palo Alto, CA; [2]Ann & Robert H. Lurie Children's Hospital of Chicago, Chicago, IL; [3]Northwestern University's Feinberg School of Medicine, Chicago, IL

Social resilience, including a sense of relatedness and the ability to use relationships to buffer against stress, is associated with T1D management behaviors and health outcomes. However, little is known about the core components of social resilience in adolescents with T1D and what may be modifiable cognitive and behavioral intervention targets. Addressing this gap will inform intervention strategies to improve health outcomes given nearly 75% of adolescents with T1D do not meet treatment targets for glycemic control. Guided by cognitive theory, the current study examined these associations longitudinally and tested a hypothesized mediator. It was hypothesized that cognitive and behavioral skills (i.e., greater positive problem-solving (PS) and lower negative PS skills) would predict fewer maladaptive cognitions, which in turn would predict greater social resilience. Adolescents with T1D (n=264, mean age=15.7, 59.8% female, 65.5% non-Hispanic white, 70.1% on insulin pump, mean T1D duration=6.9 years) participating in a clinical trial were assessed 4 times across 1 year. Participants completed questionnaires to assess positive and negative PS skills, maladaptive cognitions, social resilience, diabetes self-care, and glycemic control. Mediation effects were tested using 2 time-lagged autoregressive path models, one for each PS skill controlling for intervention assignment, age, diabetes duration, gender, race, and family income. For negative PS, model fit was adequate (RMSEA=0.07; CFI=0.92) and the hypothesized mediation effect was found (CI did not contain 0): over time, greater negative PS skills predicted more maladaptive cognitions, which in turn led to reduced social resilience. Social resilience in this sample was significantly correlated with diabetes self-care and glycemic control ($ps < 0.05$). Effects did not differ between intervention groups. In contrast, the positive PS model showed poor fit and no mediation effect. Findings suggest that factors targeted in cognitive-behavioral treatments, especially negative PS and maladaptive cognitions, impact social resilience and may be important to consider in interventions that ultimately impact diabetes self-care and glycemic control.

CULTURAL ADAPTATION OF DIABETES SELF-MANAGEMENT EDUCATION FOR U.S. RESIDING MARSHALLESE

Karen Yeary, PhD[1], Nia Aitaoto, BA, MPH, MS and PhD[2], Karra Sparks, BS[3], Mandy Ritok-Lakien, BA[3], Jonell Hudson, PharmD[3], Peter Goulden, MD[1], Williamina Bing, BS in Management[3], Sheldon Riklon, MD[3], Jellesen Rubon-Chutaro, N/A[3], Pearl Mcelfish, PhD, MBA[3]

[1]University of Arkansas for Medical Sciences, Little Rock, AR; [2]University of Arkansas Northwest, Fayetteville, AR; [3]University of Arkansas for Medical Sciences Northwest, Fayetteville, AR

Type 2 diabetes is a significant public health problem, with U.S. Pacific Islander communities bearing a disproportionate burden. In one Pacific Islander community—the Marshallese—the stark disparities in type 2 diabetes outcomes are due in part to the US Nuclear Testing Program that tested a payload equivalent to 7200 Hiroshima-sized bombs in the Republic of Marshall Islands (RMI), which displaced over 12,000 RMI residents to Arkansas, the home of the largest population of Marshallese in the U.S. Among Arkansas residing Marshallese, rates of diabetes are ~32% compared to 8% of the general US population.

Despite the appalling health inequities between Marshallese and the general U.S. population, research with Marshallese has been limited because of data aggregation of Marshallese and other Pacific Islander groups with Asian Americans, resulting in Marshallese and other Pacific Islanders groups an “invisible” population within an already understudied minority.

Given the weak body of evidence to guide service planning in managing type 2 diabetes among Marshallese, we used a community-based participatory research approach to adapt an evidence-based diabetes self- management education (DSME) intervention for Marshallese. We began the DSME curriculum adaptation by reviewing the results of previously conducted focus groups (n=41) and pilot studies regarding Marshallese’s diabetes beliefs and behaviors. We combined this previously collected formative data with a literature review to create a curriculum, which was reviewed using an iterative process with community and academic experts.

Specific cultural components were recommended for adapting the seven key components of the DSME curriculum. Cultural considerations included the dichotomous vs.

gradient conceptualization of ideas, the importance of engaging the entire family, the use of nature analogies, the role of spirituality, the value of ‘pacific natural’ medicine, and a collectivistic orientation. These identified key cultural considerations can help inform others’ work in type 2 diabetes with Marshallese communities.

DECONSTRUCTING ANXIETY AND POSTTRAUMATIC STRESS AMONG ADULTS WITH TYPE1 DIABETES

Bret Boyer, Ph.D.[1], Chelsea Renna, PsyD[2]

[1]Widener University, Philadelphia, PA; [2]CHaC, Philadelphia, PA

Posttraumatic stress symptoms (PTS) have been reported among adults with type1 diabetes (T1D), both related to experiences with hypoglycemia and with hyperglycemia, but studies have not simultaneously assessed these two phenomena within the same populations. This study investigated PTS related to 1) hypoglycemia, 2) hyperglycemia, and 3) T1D diagnosis among 241 adults with T1D (Age 18-79, Mean=36.9, SD=12.5; 79% women; 84% Caucasian). Exploratory Factor Analyses identified a 2-factor structure on the posttraumatic diagnostic scale (PDS) for hyperglycemia experiences (Triggered T1D-specific Anxiety/Active Avoidance [T-sAAA], Numbing/General Reactivity), and a 3-factor structure for hypoglycemia experiences (T-sAAA, Numbing/General Reactivity, hypervigilance). Using only the scores for the T-sAAA for hypoglycemia and hyperglycemia, and for general T1D, a cluster analysis identified a three-cluster solution (High PTS scores on all 3 [HiAll], Low PTS scores on all 3 [LoAll], High Pts regarding hypoglycemia, but low for hyperglycemia and T1D [PTShypo], and high PTS for hyperglycemia and T1D, low for hypoglycemia [PTShyper]). MANOVA were run to test for differences between these cluster groups on self-management and T1D outcomes, finding significant differences for HbA1c ($F(3)=9.57, p < .001$), total T1D complications ($F(3)=3.63$, $p < .014$), Severity of hypoglycemic episodes during previous month ($F(3)=11.51$, $p < .001$), and Self Care Inventory scores ($F(3)=3.28$, $p < .022$). The LoAll cluster showed best scores on these variables, with the HiAll group showing worst glycemic control and poorest outcomes. While the PTShypo cluster showed significantly lower HbA1c, total T1D Complications, less severe hypoglycemia, and better self-management behavior than the HiAll cluster, the PTShyper cluster was not significantly lower than the HiAll cluster for total complications or higher on SCI score. The PTShypo cluster did not differ significantly from the LoAll cluster. A Cluster Analysis to examine sub-samples of cases with different patterns of HbA1c, #hypoglycemia, Severity of hypoglycemia, and T1D Complications identified 3 clusters with different patterns of these outcomes, and PTShyper versus PTShypo clusters showed a significant chi-squared for their representation in these outcome clusters (Chi-Square=7.83, $p < .02$). Clinical implications of identifying cases with these distinct patterns of diabetes-specific anxiety are interpreted from the patterns in their diabetes self-management and glycemic control.

ILLNESS BELIEFS OF SPECIALTY CLINIC PATIENTS WITH TYPE 2 DIABETES PRESCRIBED INSULIN

Jennifer F. Ward, PhD[1], Barbara A. Stetson, Ph.D.[2], Stephanie R. McDonough, M.A.[2], Christen McKiel, BA [3], Sriprakash Mokshagundam, MD[4]

[1]University of Louisville, Hermitage, TN; [2]University of Louisville, Louisville, KY; [3]University of Louisville, Jeffersonville, IN; [4]University of Louisville, Louisville, KY, Louisville, KY

Background: Exogenous insulin use in the management of Type 2 (T2) Diabetes Mellitus (DM) has grown in recent years. Patient beliefs related to treatments in this population will help to inform clinical work and research related to both insulin treatment adherence and decision-making efforts.

Aim: 1) Illness beliefs (IPQ-r) related to T2DM, such as beliefs about DM chronicity, symptoms and severity, and insulin treatment effectiveness are examined and (2) associations between these beliefs and time since DM diagnosis, insulin prescription duration and medical outcomes (HbA1c%) are explored.

Method: Percent of participants endorsing “agree or strongly agree” beliefs for items and subscales related to personal and treatment management of DM are reported. Linear Regression and ANOVA used for continuous and group associations.

Result: Participants were 167 adults with T2DM (49% male) prescribed exogenous insulin at a specialty diabetes clinic. Self-report missing data was high (30%). Participants were moderately controlled [HbA1c%M=8.13 (1.4)]. The majority experienced recent changes in insulin dose or frequency (59.1%) per chart review. Self-reported adherence to insulin was high (SDSCA, 76.7% daily). Insulin duration [M=66.4 (49.1), range 9-257 months] and DM diagnosis duration [M=190.0 (100.1), range 9 – 558 months] varied, though there was significant (43.4% and 17.9%) missing chart data.

Participants attributed several symptoms, including pain (58.3%), fatigue (69.5%) and sleeplessness (49.0%) to their T2DM. Most participants reported beliefs that T2DM is permanent (85.4%) and serious (94.3%). Beliefs about personal (90.3%-96.0%) and treatment management of DM (68.6%, 81.0%) were generally positive with some reporting cure potential with T2DM treatment (31.7%). Tested relationships between DM beliefs, HbA1c% and DM diagnosis duration were not significant. Longer insulin duration was associated with negative beliefs about treatment, but not personal, management (ß=.28, p=.02).

Conclusions/Implications: High compliance with insulin treatment was reported in clinical participants with T2DM prescribed exogenous insulin. Self-reported insulin treatment beliefs suggest that most view treatment and personal management of T2DM as achievable and likely to improve outcomes. Results indicate that longer insulin treatment duration was related to more negative beliefs regarding insulin treatment. Missing responses may reflect uncertainty about these beliefs. Reported beliefs were not associated with HbA1c%. Longer insulin treatment in this population may lead to less positive beliefs in treatment effectiveness and potentially reduced compliance. Understanding beliefs about DM and insulin treatment in this growing population will help inform treatment adherence and decision-making efforts both clinically and in future research.

MHEALTH-BASED MULTICOMPONENT LIFESTYLE INTERVENTION IN OBESE PATIENTS WITH DIABETES AND CHRONIC KIDNEY DISEASE

Lu Hu, PhD[1], Kathleen Woolf, PhD, RD[2], David St-Jules, RD, PhD[1], Ram Jagannathan, PhD[3], David S. Goldfarb, MD[4], Stuart Katz, MD[4], Aditya Mattoo, MD[5], Alex Sierra, MS[6], Mary Lou Pompeii, RDN, CSR, CDN, CDE[3], Nicole Skursky, BA[7], Lisa Ganguzza, MS, RD, CDN[8], Mary Ann Sevick, ScD, RN[7]

[1]Center for Healthful Behavior Change, NYU School of Medicine, New York, NY; [2]NYU Steinhardt, New York, NY; [3]Center for Healthful Behavior Change Department of Population Health New York University School of Medicine, New York, NY; [4]NYU Langone Medical Center, New York, NY; [5]NYU Langone Medical Center, NEW YORK, NY; [6]Center for Healthful Behavior Change Department of Population Health New York University School of Medicine, NEW YORK, NY; [7]Center for Healthful Behavior Change Department of Population Health New York University School of Medicine, new york, NY; [8]NYU School of Medicine, New York, NY

Purpose

In-person lifestyle interventions are effective for chronic disease management; however, several fundamental barriers (e.g., transportation, schedule conflicts) limit real-world implementation and scalability. In this pilot study, we evaluated the use of mobile technology to deliver a multi-component lifestyle intervention for engaging patients with type 2 diabetes (T2D) and concurrent stage 2-4 chronic kidney disease (CKD) in multiple behavior changes (restriction of dietary energy, sodium and phosphate additives, and increased physical activity). In this report, we describe feasibility, acceptability, and participant satisfaction.

Methods

Participants were randomized to either a usual care (UC) or a multicomponent, behavioral intervention group. The intervention components included: (1) Social Cognitive Theory (SCT)-based group counseling, and (2) technology-based self-monitoring of diet, weight and physical activity. All intervention sessions were delivered remotely using videoconferencing weekly for 4 weeks and then biweekly for the next 20 weeks. Participant's satisfaction was assessed by an investigator-developed, 5-point, Likert-scaled survey (1=strongly agree, 5=strongly disagree) at 24 weeks.

Results

A total of 14 participants were randomized to the UC (n=7) or SCT-based intervention (n=7). The study sample was predominantly white (71.4%), male (71.4%), and currently or living as married (57.1%) with a mean age of 65.9 (9.7_{SD}) years, and BMI of 34.4 (7.0_{SD}) kg/m^2. The median time devoted to technology training for this aging sample was 45 minutes (IQR=30-45 minutes). Of the 1,134 person-days of possible self-monitoring, the median proportion of days in which at least 3 meals was logged was 95.8% (IQR=72.0-99.4%), and the median number of meals entered was 3.7 meals/day (IQR=2.8-3.8). Attendance for the 14 online group sessions averaged 94% ($.07_{SD}$). Participants reported: ease in using the touchscreen to operate (Mean±SD: 1.2±.4) and access group sessions on the iPad (2.0±1.0); a desire to use the iPad to manage their health once the study was over (1.4±.5); technology-based self-monitoring helped them understand how to change their diet (1.6±.9), keep track of nutrition (1.8±1.3), stay motivated (1.6±.5), and limit sodium (1.6±.9) and calorie intake (1.4±.5).

Conclusions

This pilot study demonstrated that a multicomponent intervention involving remotely delivered group counseling and technology-based self-monitoring is feasible and acceptable to an aging population with T2D and concurrent CKD. Additional research is needed to evaluate the incremental contribution of the individual intervention components and their interaction effects for engaging this patient population in multiple lifestyle behavior changes.

MINDFULNESS AMONG ADULTS WITH DIABETES: RELATIONSHIPS WITH SELF-CARE AND GLYCEMIC CONTROL

Andrea E. Lagotte, MA[1], Chandra Osborn, PhD, MPH[2], Lindsay S. Mayberry, MS, PhD[1]

[1]Vanderbilt University Medical Center, Nashville, TN; [2]One Drop, Nashville, TN

Several recent diabetes interventions target mindfulness to improve adherence to self-care and outcomes. However, few have examined mindfulness as a determinant of diabetes self-care behaviors or glycemic control (A1c).

We recruited English-speaking adults with type 2 diabetes (T2D) from Vanderbilt University Medical Center to participate in a randomized control trial of the Diabetes MAP web-based medication adherence intervention. We collected self-reported demographics (age, gender, race, ethnicity, education, income), responses to the Mindfulness Attention Awareness Scale (MAAS), Adherence to Refills and Medications Scale for Diabetes (ARMS-D; dichotomized as perfect vs. suboptimal adherence) and Summary of Diabetes Self-Care Activities (SDSCA) general diet, specific diet, exercise and self-monitoring of blood glucose (SMBG) at baseline. Participants also completed a baseline lab A1c test. Spearman’s rho and Mann-Whitney U tests examined bivariate associations between demographics and mindfulness. Linear or logistic regression models examined relationships between mindfulness and adherence to each self-care behavior and A1c at baseline. All models were adjusted for demographics.

Participants (N=151) were 55.3±10.9 years old, 60% female, and 24% non-White, with 15.2±1.8 years of education, and 25% annual incomes < $40K. A1c was 8.0±1.5%. MAAS scores were 4.9±0.8 (possible range 1-6), with higher scores indicating greater mindfulness. Demographics were not associated with mindfulness. Greater mindfulness was marginally associated with a higher odds of perfect adherence (AOR=1.77, p=.11) and significantly associated with better adherence to general diet (β=.30, $p < .01$) and specific diet (β=.31, $p < .001$).

Among adults with T2D, greater mindfulness was independently associated with better adherence to general diet and specific diet, and marginally associated with greater odds of having perfect medication adherence. Greater mindfulness was not associated with adherence to exercise or SMBG. Mindfulness skills may be an effective target for interventions to improve adherence to diet and medications, but may be less effective for improving exercise or SMBG. Although mindfulness was not associated with A1c, increasing mindfulness may affect A1c through improvements in adherence to diet and medications.

OUTCOMES OF A DIGITAL HEALTH PROGRAM WITH HUMAN COACHING FOR DIABETES RISK REDUCTION IN A MEDICARE POPULATION

Cynthia M. Castro Sweet, PhD[1], Vinay Chiguluri, MPH[2], Rajiv Gumpina, M.S.[3], Paul Abbott, MBA[4], Erica Madero, BS, MS[5], Mike Payne, MBA, MSci[6], Laura Happe, PharmD, MPH[3], Andrew M. Renda, MD MPH[4], Todd G. Prewitt, MD, FAAFP[3]

[1]Omada Health, Inc., San Francisco, CA; [2]Humana, Inc, Harbor City, CA; [3]Humana Inc., Louisville, KY; [4]Humana, Louisville, KY; [5]University of California Berkeley, San Francisco, CA; [6]Virta Health, Burlingame, CA

Older adults have increasing risk for obesity and related chronic diseases, particularly Type 2 diabetes and cardiovascular disease (CVD). Current clinical guidelines recommend offering behavioral counseling programs for lifestyle management for disease risk reduction. Digital programs that combine health technology with live human coaching have recently emerged as scalable alternatives to the more traditional in-person and face-to-face formats of lifestyle management programs. Little research has examined the outcomes of these newer, technology-driven programs specifically with older adults. The goal of this observational study was to examine the outcomes of a Medicare population who participated in a digital health program with human coaching for diabetes risk reduction. Health plan members ages 65 and older who were at risk for diabetes enrolled in the program. They received weekly online curriculum, remote access to a peer support group of other participants, regular communication with a trained lifestyle coach, a wireless scale, wearable activity monitor, and food and activity tracking tools. Program participation and health outcomes were examined at 4, 6 and 12 months. A total of 501 participants enrolled in the program from 37 states. 92% completed at least 9 of 16 core lessons. Participants averaged 20 of 31 possible opportunities for weekly engagement with the program. At 12 months, participants lost 7.4% (SD=7.8%) of initial body weight, and among participants with clinical data, glucose control improved (HbA1c change = -0.14%, p=0.001) and total cholesterol decreased (-7.08, p =.008). Self-reported well-being, depression and self-care also improved ($p < 0.0001$). This Medicare population demonstrated sustained program engagement and improvements in weight, disease risk factors and well-being. The findings support use of digital programs leveraging human coaching for reducing chronic disease risk among older adults.

THE IMPORTANCE OF HAVING FUN: SHARED PLAY IN COUPLES COPING WITH TYPE 1 DIABETES

Meredith Van Vleet, Ph.D.[1], Vicki Helgeson, PhD[1], Mary Korytkowski, M.D.[2], Cynthia Berg, Ph.D.[3]

[1]Carnegie Mellon University, Pittsburgh, PA; [2]University of Pittsburgh, Pittsbugh, PA; [3]University of Utah, Salt Lake City, UT

Chronic illness research has traditionally focused on stressful contexts associated with the illness and their impact on health and well-being, while overlooking the role of positive events on health and well-being. We examined “shared play” as a positive relationship context that is likely to affect well-being and self-care among couples coping with type 1 diabetes: Shared play is defined as activities that are pursued for fun/amusement, that are carried out with an enthusiastic and in-the-moment approach, and that are highly interactive. Shared play is likely to be an enjoyable experience that provides a momentary break from strains and responsibilities, and serves a bonding function between partners. When partners are in better moods, less stressed, and feel closer to one another, they are likely to engage in better problem-solving together in diabetes contexts, discuss diabetes more, and have greater communal coping (i.e., appraise diabetes problems as shared and collaborate in resolving problems), and engage in better self-care. We examined links between average daily shared play to positive affect, general stress, diabetes stress, diabetes disclosure, communal coping, and self-care behavior in a study of 143 patients with type 1 diabetes and their spouses (95% white, 61% female, average age= 46, range= 25-75). Couples completed online questionnaires for 14 days assessing shared play and proposed outcomes. Aggregates of shared play and outcomes across the 14 days were used in analyses. Results indicated that greater shared play across the 14 days was linked with greater positive affect, less general stress, more diabetes disclosure, more communal coping, and more exercise (all *p*’s < .05), but was unrelated to diabetes stress or self-care behavior. These results suggest that shared play is associated with a more intimate, positive relationship atmosphere, which is more conducive to diabetes communication and a shared approach to diabetes self-care.

DO AS I SAY NOT AS I DO: THE RELATIONSHIP BETWEEN PARENTS’ DIETS AND THEIR ATTITUDES TOWARD THEIR ADOLESCENTS’ DIETS

Sasha A. Fleary, PhD

Tufts University, Medford, MA

Background: The parent-child diet relationship has been widely investigated with parent modeling and availability of foods in the home being implicated. Further, studies have found that parenting practices around diet determine the quantity and types of foods children consume. Few studies have focused on adolescents and little is known about how attitudes toward their adolescents’ diet are related to parents’ diet. Thus, this study aimed to determine whether parents practice what they preach by exploring the relationship between parents’ diet and their attitudes towards their adolescents’ fruits and vegetables (FV), and sugary foods and drinks intake. Given the role of diet in obesity and the likely internal conflict for obese parents trying to regulate their adolescents’ diet, the second aim of this study explored if parents’ obesity status affected the relationship between their diet and attitudes toward their adolescents’ diet.

Methods: Parent data were obtained from the National Cancer Institute’s Family Life, Activity, Sun, Health, and Eating Study. Parents (n=1859, 72% female, 69% White, 62% overweight/obese) completed measures of their FV, and sugary foods and drinks intake, supportive and controlling attitudes for adolescents’ diet, and availability of foods at home. Regressions were computed to address the aims of the study.

Results: For fruits, availability of (B=.32, p < .001) and supportive attitudes (B=.17, p < .001) for FV were related to intake. Availability of FV (B=.31, p < .001) and supportive (B=.21, p < .001) and controlling attitudes for FV (B=.15, p < .001) were also related to vegetable intake. FV regressions did not differ by obesity status. For sugary foods, availability of (B=.33, p < .001) and supportive attitudes (B=-.07, p=.001) for a non-sugary foods diet were related to sugary foods consumption. Additionally, regressions coefficients for controlling attitudes differed by obesity status (F=4.52, p=.03). Availability of sugary drinks (B=.34, p < .001) was related to sugary drinks intake and regression coefficients for controlling attitudes differed by obesity status (F=4.40, p=.03).

Discussion: This study confirms that parents adopt a “do as I say not as I do” approach regarding healthy eating and this is especially true for sugary foods and drinks intake. Implications for future research include exploring the cognitive processes behind parents' misaligned attitudes and behaviors and investigating how these inconsistencies are related to adolescents’ behaviors to better develop parent-adolescent diet interventions.

FACTORS ASSOCIATED WITH LOW-INCOME PRESCHOOLERS HAVING A TV ON AND CHILD WATCHING TV DURING DINNER

Teresia O'Connor, MD, MPH[1], Sheryl Hughes, PhD[1], Ann Chen, PhD[1], Thomas Power, PhD[2]

[1]Baylor College of Medicine, Houston, TX; [2]Washington State University, Pullman, TX

Background: Turning the TV off during meals is a common obesity prevention strategy promoted by interventions. However few directly observed data are available of the prevalence of having the TV on during meals or the amount of time a child spends watching TV during meals to inform who would most benefit from these messages. The aim of this study was to assess factors associated with a) having a TV on during dinner and b) duration of child watching during meals, among low-income ethnic minority families with preschool aged children.

Methods: Analysis of a cross-sectional home dinner observation study of Hispanic and black families whose 3-5 year old child attended Head Start. Three home dinners were video recorded among 144 families. Parents self-reported demographics and Caregiver's Feeding Style Questionnaire. Videos were coded for whether TV was on and number of people eating together. Of those with TV on, two coders assessed and reached consensus if they could determine whether and when child was watching TV (depending on position of TV and video-recording equipment). Those videos were coded for the duration of the meal the child watched TV. 20% of videos were double coded to assess intercoder reliability. Multilevel models with video observation nested within family assessed factors associated with having TV on and duration (as % of meal time) child watched TV.

Results: The sample consisted of 59.7% Hispanic and 40.3% black families. The average number of people eating dinner, including the child, was 2.1 (SD 1.3) and 43.8% of parents were married. Of the 428 videos, 39.3% had TV off, 59.8% had TV on (44.2% were codable, 15.7% TV-on, but whether child was watching was uncertain/not codable), and in 0.9% of videos we could not tell if TV was on (removed from analysis). The inter-coder ICCs were 0.85-0.99 for the duration codes. For codable videos with TV on, children spent 17.1% (SD 19.1) of the meal watching TV. Only ethnicity was significantly associated with having the TV on during dinner in the full model, with odds ratio of 0.18 (95% CI 0.08, 0.41) of Hispanic having TV on as compared to black families. Having unmarried parent (p=0.05) and fewer number of people eating together at dinner (p

Conclusion: A majority (60%) of the observed dinner meals had a TV on, but having the TV on during dinner was more common among black than Hispanic families. Targeting black families and families with unmarried parents may be particularly important. Future studies will need to see if increasing the number of people eating with the child at dinner decreases their tendency to watching TV during the meal.

USING THE INTEGRATIVE MODEL OF BEHAVIORAL PREDICTION TO PREDICT SUGARY DRINK CONSUMPTION OF OVERWEIGHT AND OBESE ADULTS

Maria Collado-Rivera, MS, CHES, Paul Branscum, PhD, RD

The University of Oklahoma, Norman, OK

Researchers and practitioners draw upon a number of theoretical paradigms within social and behavioral health. In an attempt to integrate these paradigms, the Integrative Model of Behavioral Prediction (IMB) was developed. The development of the IMB began at a workshop sponsored by the National Institute of Mental Health, and was attended by a group of behavioral theorists who worked together to identify similarities and differences among prominent theories of behavior change and prediction. The IMB posits that individual behavior is predicated upon having sufficient intentions to behave in certain ways, barring any deficiency in skills and abilities to perform the behavior, and environmental constraints. Behavioral intentions are further influenced by three factors: attitudes towards a behavior, perceived norms (PN), and perceived behavioral control (PBC). Since its creation, few researchers have fully operationalized its constructs for investigation. Therefore, the purpose of this study was to explore the utility of the IMB with obese and overweight adults' attempting to lose weight, for predicting the behavior "To stop drinking regular soda and other sugary drinks for the next 6 months". This study was conducted over the course of 2 phases. During the first phase, an elicitation of beliefs from the target population was accomplished, to elicit salient beliefs for survey development. Next, weight loss patients (n=410) completed a valid and reliable survey, evaluating the essential constructs of the IMB. For this phase, a hypothesized path model was tested (AMOS 17.0) for which attitudes, PN and PBC predicted behavioral intentions, and intentions, PBC, skills, and environmental constructs predicted sugary drink consumption. Overall, fit indices of the model were good (CFI=.970, TLI=.921, RMSEA=.062), and a significant amount of the variance of intentions (R2=.407) and sugary drink consumption (R2=.162) were predicted. Results suggest that the IM is an advantageous and practical theory for explaining health behaviors related to obesity prevention and treatment. Further work is needed to better operationalize constructs of the IM that have not been fully explored.

VEGANS: JUST LIKE US, ONLY HEALTHIER

Sydney Heiss, B.A.[1], Jaime Coffino, M.P.H.[2], Julia M. Hormes, Ph.D.[2]

[1]University at Albany, SUNY, Delmar, NY; [2]University at Albany, SUNY, Albany, NY

Introduction. It has been posited that vegans (i.e. individuals who refrain from consuming all animal products) engage in chronic unhealthy behaviors, especially in regard to diet and weight. Unfortunately, the large majority of studies interested in the behaviors of meat-refrainers are unable to obtain a large enough sample of vegans to make meaningful comparisons. This study examines indicators of health in one of the largest samples of vegans recruited from the general population, in comparison to omnivores (i.e. individuals who do not refrain from any animal products). **Methods.** Respondents were categorized based on self-reported vegetarian status. For the purposes of the present study vegans (*N* = 287; female = 84.0%; mean age = 31.7 ± 12.5) were compared to omnivores (*N* = 165; female = 76.4% mean age = 30.9 ± 13.7). Relevant measures include reports on demographics, height, actual and ideal weight, smoking behaviors, the Alcohol Use Disorders Identification Test, Food Frequency Questionnaire, Orthorexia Scale, Binge Eating Scale, Drive for Thinness Scale, Drive for Muscularity Scale, and Yale Food Addiction Scale. Groups were compared in a series of chi-square, independent samples t-tests, and univariate and multivariate analyses of variance (for measures containing multiple subscales). Gender was included as a covariate when significant. **Results.** Vegans were more likely than omnivores to be female ($p = .05$). Vegans more frequently ate fruits, vegetables, nuts, beans, and grains, but less frequently consumed caffeinated soft drinks (all $p < .001$). Vegans were more likely to prepare food at home and more likely to consider themselves "healthy" (both $p = < .001$), but scored lower on the Orthorexia Scale ($p < .001$), were less likely to exhibit "moderate" binge eating ($p = .01$), and endorsed a lower drive for thinness ($p = .01$). There were no differences between groups in age, BMI, proportion of respondents categorized as underweight, normal weight, overweight, or obese, reported discrepancy between current and ideal weight, frequency and length of exercise, alcohol use, smoking behaviors, drive for muscularity, or scores on the Yale Food Addiction Scale. **Discussion.** This study begins to paint a more accurate picture of health behaviors in vegans. It seems as though vegans exhibit markers of healthier behaviors (e.g., increased fruit and vegetable consumption, increased home-cooking, self-reported healthfulness) but simultaneously do not exhibit the negative effects often thought to result from continuous self-monitoring of the diet (e.g., increased drive for thinness, low BMI, increased orthorexia score). Ultimately, vegans do not appear to differ from omnivores to a large degree, and when they do, it seems to be in meaningful healthful ways.

YEEGO GARDENING!: A COMMUNITY GARDEN INTERVENTION TO PROMOTE HEALTH ON THE NAVAJO NATION

India Ornelas, PhD[1], Desiree Deschenie, Bachelors[2], Sonia Bishop, Kevin Lombard, Shirley A.A. Beresford, PhD[1]

[1]University of Washington, Seattle, WA; [2]New Mexico State University, Farmington, NM

Background: American Indians and Alaskan Natives (AI/AN) are at increased risk for obesity and diabetes in part due to their diet, including low consumption of fruits and vegetables. Several factors contribute to the low consumption of fruits and vegetables among Navajo, including lack of access to, barriers to growing, and high cost of fruits and vegetables. The goal of our study was to develop a theory-based and culturally relevant community garden intervention to increase gardening practice and fruit and vegetable consumption in two Navajo communities. In this presentation, we describe our process of designing the intervention by both drawing on behavioral theory and solicited input from Navajo community members. **Methods:** Using Social Cognitive theory, focus group findings and input from our community partners, we developed an intervention consisting of three integrated components: 1) a community/demonstration garden plot, 2) technical assistance workshops to increase gardening and healthy eating and 3) community outreach. These three intervention components aimed to increase gardening and healthy eating by increased access to fresh produce grown in the community gardens, as well as by increasing participants' self-efficacy, self-monitoring and behavioral capability to garden, prepare and consume fruits and vegetables. Gardens were constructed and maintained in collaboration with community-based organizations in 2 Navajo communities. Monthly workshops were held throughout the growing season, which incorporated aspects of Navajo culture and opportunities to build confidence and skills in gardening and healthy eating behaviors. In addition, program staff attended community events to promote gardening and healthy eating. **Conclusions:** Community input was essential throughout the planning and implementation of the intervention. If effective, community garden interventions may improve the food environment in areas with limited access to healthy foods. Increasing access and knowledge about healthy eating behaviors may ultimately reduce risk for obesity and diabetes in Navajo communities.

EXPLORING THE RELATIONSHIPS BETWEEN SOCIAL MEDIA TECHNOLOGY, COMPETITION, AND FITNESS MOTIVATION AND ENJOYMENT

Lauren Galantai, none, Joanne Hash, PhD

Whittier College, Whittier, CA

Fewer than half of American adults meet the recommended guidelines for aerobic physical activity (CDC, 2016), which may contribute to the high rate of obesity in the US (NIH, 2012). This trend may be due to a lack of motivation, and/or lack of social support, to exercise. Mobile fitness applications, like Fitbit and Strava, have been introduced to help increase physical activity through the use of technology (Bauer & Kriglstein, 2015). The current study explores how fitness technology and friendly competition may interact with self-efficacy, motivation, effort, and enjoyment in fitness. Forty healthy adults (30 F, age 18-61, M=22.6, SD=7.4) were assigned to 1 of 2 experimental groups, Fitbit (n=12) or Strava (n=13), or to the social context-free pedometer control group (n=15). The Fitbit group tracked their steps, while the Strava group timed their run through a specified 0.2-mile course (the pedometer participants either tracked steps or ran the course without social context). Each experimental group competed in counterbalanced 1 week of app-based competition and 1 week of non-competition tracking. The social settings of competition differed in each experimental group; Fitbit participants competed against friends, while Strava participants competed against strangers. During the non-competition and competition phases, each of the groups showed significant positive correlations between competitiveness, enjoyment, effort, self-efficacy, and motivational styles ($p < 0.05$). Interestingly, the Fitbit group had a significant relationship between enjoyment and intrinsic motivation during the non-competition phase, $r(12)=0.630$, $p < 0.05$, but lost it during competition, where a significant relationship was found between enjoyment and extrinsic motivation, $r(12)=0.578$, $p < 0.05$. Similarly, during the competition phase, the relationship between extrinsic motivation and competitiveness also became significant for the Fitbit group, $r(12)=0.631$. For the Strava group, during competition there was a significant negative relationship between effort and intrinsic motivation, $r(13)=-0.580$, $p < 0.05$. It appears that the type of tech-based social context that an individual engages in has an influence on motivational styles and enjoyment in fitness activities. Competing against friends appeared to increase extrinsic motivation and enjoyment, while competing against strangers resulted in a negative relationship between effort and intrinsic motivation. Having a more nuanced understanding of the complex relationships between motivational style, mobile fitness applications, and social context may not only have implications for altering personal fitness behaviors, but also may impact adherence to fitness-based treatment regimens.

HEALTH PRIVACY: PERCEPTIONS AND PREFERENCES AMONG ADULTS AND TEENS

Matthew J. Bietz, Ph.D.[1], Cynthia Cheung, MPH/MA (c)[2], Cinnamon S. Bloss, Ph.D.[2]

[1]University of California, Irvine, Irvine, CA; [2]University of California - San Diego, La Jolla, CA

This paper reports on a qualitative study of individual preferences and preferences around the privacy of personal health information. We conducted 7 focus groups with 51 people to understand the expectations that individuals have for the privacy of their health information and how privacy preferences for health information may be different from preferences for other kinds of personal information. Focus groups were conducted with a variety of cohorts, including: middle school students (2 groups); members of a breast cancer research cohort (2 groups); and members of community-serving organizations (3 groups). Focus groups included between 3 and 12 participants (median = 6). Three of the focus groups (both middle-school and one community group) were conducted with teenagers (age 14-19 years, n=24). Focus groups were conducted using a semi-structured protocol that covered issues relating to general privacy definitions and preferences, electronic health records, genomic data, tissue donation, and personal health and lifestyle data (e.g. wearable health devices). Focus groups were transcribed and analyzed using a grounded theory approach to understand emergent themes in the discussions. After the focus groups, participants filled out surveys that included demographic information as well as information about their interactions with health providers and attitudes toward privacy.

The results of this study suggest that both adults and teenagers are concerned with privacy, but that their specific concerns differ. For example, teenagers were more likely to see privacy through a commodity lens in which personal information had inherent value. Teens were more willing to exchange their personal data for the use of a service, and more often cited a belief that they should receive some form of compensation (monetary or otherwise) from those who wanted to mine their data. Teenager concern for the privacy of health data was also lower than for adults. Post-focus-group surveys showed that while adults were more likely to distrust corporations and legal protections for privacy, teenagers were more likely to be “privacy pragmatists” who weighed the benefits of services against the potential privacy intrusions. Participants of all ages wanted to own their personal data but were unsure of who actually did own it. This paper discusses these findings and their potential impact on acceptance and adoption of new health technologies.

HOW TO STAY HEALTHY WHILE STUDYING ABROAD: AN ELECTRONIC MAGAZINE FOR COLLEGE STUDENTS

Hannah Lightcap, Bachelor of Science in Dietetics[1], Marie Kuczmarski, PhD[2], Lisa Chieffo, EdD[2]

[1]University of Delaware, Elkton, MD; [2]University of Delaware, newark, DE

Title: How to Stay Healthy While Studying Abroad: An Electronic Magazine for College Students

Objectives: List the top three areas which students utilized from the electronic [*e*] magazine. List the three lifestyle behaviors students attributed to their physical wellness whilst on their travel study.

Introduction: Increasing numbers of U.S. students participate in international and domestic travel study programs. While most institutions include material on health-related topics such as immunization, psychological distress, personal assault, and water quality, comprehensive coverage of strategies to ensure optimal physical wellness during travel study has been overlooked. To fill that void “How to Stay Healthy While Studying Abroad”, a comprehensive wellness guide, was designed as an *e* magazine for undergraduate students.

Research Objectives: The primary objective was to evaluate the usefulness of the e magazine. The secondary objective was to enhance the content of the guide based on an assessment of students' attitudes, perceptions, and behaviors related to wellness pre- and post-participation in travel study programs.

Methods: Of the 1,137 students enrolled in travel study programs in the winter 2016 term, 344 students completed the pre-travel questionnaire and 172 the post-travel questionnaire. Students were recruited via email invite. Study protocol was approved by the University of Delaware’s Institutional Review Board. Questionnaires were pilot tested and focused on evaluating aspects of the *e* magazine, as well as attitudes, perceptions, behaviors, and barriers to optimizing physical wellness.

Results: Hydration (66%), health during travel (57%), and getting enough sleep (54%) were topics most utilized. Self-motivation, social support, and tips within *How to Stay Healthy While Studying Abroad* were the top three factors contributing to students' achievement of physical wellness on their program. The majority of respondents (87%), indicated they would recommend *How to Stay Healthy While Studying Abroad* to others going on a travel study

program.

Conclusions: These findings support the need for inclusion of physical wellness guides in pre-departure materials to help students maintain their health while navigating new environments during travel study programs.

LESSONS LEARNED FROM A PROCESS EVALUATION OF AN ONLINE ORGAN DONATION EDUCATIONAL INTERVENTION

Nakeva Redmond, MPH[1], Laura Harker, MPH[2], Yvan Bamps, PhD[3], Shauna Flemming, MPH, MDiv[4], Kimberly J. Arriola, PhD/MPH[5], Jennie P. Perryman, RN, PhD[6], Nancy J. Thompson, Ph.D., M.P.H.[7], Rachel E. Patzer, PhD, MPH[8]

[1]Emory University, Atlanta, GA; [2]Georgia Budget and Policy Institute, Atlanta, GA; [3]School of Medicine, Emory University, Decatur, GA; [4]Emory University, Rollins School of Public Health, Atlanta, GA; [5]RSPH of Emory University, Atlanta, GA; [6]Emory Transplant Center/Emory Healthcare/Emory University, Atlanta, GA; [7]Department of Behavioral Sciences and Health education/Rollins School of Public Health/Emory University, Atlanta, GA; [8]Emory University School of Medicine, Atlanta, GA

Lessons Learned from a Process Evaluation of an Online Organ Donation Educational Intervention

The number one problem in transplantation today is the lack of available organs. Internet use is at an all-time high[1], creating an opportunity to increase public commitment to organ donation through the broad reach of web-based, behavioral interventions. Implementing Internet interventions, however, presents some challenges, including preventing fraudulent respondents and ensuring intervention uptake. While web-based organ donation interventions have increased in recent years, process evaluation models fit for web-based interventions are lacking. This study outlines a refined process evaluation model adapted for online settings and used to assess the implementation of a web-based intervention aimed to increase organ donation among African Americans (AA).

We used a randomized, pretest-posttest control design to assess the effectiveness of the intervention website, which addressed barriers to organ donation through corresponding videos. Eligible participants were AA adult residents of Georgia (GA) who were not registered on the state donor registry. Drawing from previously developed process constructs[2], we adapted reach (proportion of eligible participants), recruitment (online mechanism used to recruit participants), dose received (intervention uptake) and context (factors in the cyber world affecting implementation) for use in Internet-settings.

Reach: A total of 1,415 individuals completed the eligibility screener; 948 (67%) were determined eligible, of which 97% (n=918) completed the study. *Recruitment:* A total of 67%

of participants were recruited from an online recruiter. *Context:* Approximately 75% of responders resided outside of GA (n=577) and 22% of resided outside of the U.S. (n=172); 27% of all participants were repeat visitors (n=206). After eliminating these data, only 17 participant surveys remained. *Dose received*: No videos were watched in their entirety and the average website session duration was just 17 seconds over the minimum. Our adapted process evaluation model confirmed fraud and minimal uptake to be serious threats to Internet studies, and underscore the need for using a process evaluation model fit for web settings to identify such threats.

OLDER ADULTS' INTERNET USAGE PATTERNS AND RELATIONSHIP WITH SOCIAL ENGAGEMENT

Ching-Ju Chiu, Ph.D.[1], Cheng-Sian Chang, Ph.D.[2], Dai-Chan Lin, M.S.[2]

[1]Institute of Gerontology, College of Medicine, National Cheng Kung University, Tainan, Tainan, Taiwan (Republic of China); [2]National Cheng Kung University, Tainan, Tainan, Taiwan (Republic of China)

Objectives: Literature has offered little guidance on whether diverse types of Internet use among older adults exist and whether they have significant reciprocal associations with older adults' social engagement in their daily lives.

Methods: This study randomly selected older adults aged 50 and older representative of silver surfer in Taiwan from two urban and two rural areas and interviewed the participants through telephone interviews (n=248). We employed cluster analysis to identify their Internet use patterns, the multinomial logistic regression analyses to ascertain characteristics associated with the Internet usage patterns, and the multiple regression to examine if the Internet usage pattern associated with social engagement in real life.

Results: Four user types were identified: Leisure (32%), Sporadic (26%), Instrumental (21%), and Eager (21%). Education level, Internet use history, perspectives, and social engagement in daily life were the authentic predictors of Internet user types. Eager and Leisure Users had significantly higher scores on social engagement in their daily lives compared with Sporadic Users after controlling for significant sociodemographic and behavioral covariates.

Conclusions: Findings from this study underline the importance of the older population segment regarding their different characteristics and needs. It also suggests the possibility of Internet use for increasing social engagement in old age.

QUALITATIVE STUDY OF TEXT MESSAGING FOR SMOKING CESSATION

Claire A. Spears, PhD[1], Natalie K. Anderson, BA[2], Sadaf Lotfalian, MA[2], Lorien Abroms, ScD, MA[3], David W. Wetter, Ph.D.[4]

[1]Georgia State University, Atlanta, GA; [2]Catholic University, Washington, DC; [3]George Washington University, Washington, DC; [4]University of Utah, Salt Lake City, UT

Mobile health technologies offer unique opportunities for cost-effective dissemination of health promotion interventions. A growing body of research supports text messaging programs for smoking cessation. However, qualitative research could be critical for informing the development of more engaging, acceptable, and effective text-messaging interventions. This is particularly important among underserved populations (e.g., low-income and racial/ethnic minority smokers) at risk for tobacco-related health disparities. This qualitative study assessed views of text messaging for promoting smoking cessation and suggestions for improving these programs among low-income, primarily African American smokers. Four focus groups were conducted with a total of 15 adult smokers interested in quitting. Most participants were women (80%), African American (86.7%), and reported annual income < $18,000 (60%). The facilitator asked participants about their level of interest in text messaging to help them quit smoking; preferences for structure and timing of messages; and suggestions for content of messages (including reactions to sample text messages), as well as other suggestions for making the program more helpful and user-friendly. Groups were audio-recorded, transcribed, and coded using QSR NVivo 10. Overall, participants were open to text messaging for smoking cessation, and most were enthusiastic. Some were skeptical that texts would help them quit in the absence of other support, but believed that text messages in addition to in-person treatment and nicotine patches would be helpful. Primary themes regarding suggestions for improving text-based interventions included: incorporating as much personalization as possible (e.g., sending reminders of personal reasons for quitting); making text messages as short as possible; sending visual messages (e.g., motivating pictures); providing specific strategies for coping with cravings; and, in the context of smoking lapses, encouraging people to forgive themselves for the “slip” and get back on track. Results provide suggestions that could be useful for improving engagement with and effectiveness of text messaging smoking cessation programs among low-income African American smokers.

READABILITY OF PRIVACY POLICIES FOR APPS TARGETED TO YOUTH

Gitanjali Das, BS, Cynthia Cheung, MPH/MA (c), Camille Nebeker, Ph.D., Cinnamon S. Bloss, Ph.D.

University of California - San Diego, La Jolla, CA

Privacy policies are pervasive in the digital age. In practice, users, including youth, must read and “agree” to the contents of these policies in order to access and use nearly all computer and mobile device apps. The extent to which youth, in particular, are able to comprehend these contracts, however, remains questionable. We assessed reading grade level, reading ease, and word count of privacy policies for apps that are either available or targeted to youth. Privacy policies for 64 popular apps were collected and analyzed. Readability metrics were compared to the average US adult reading level, as well as to the Patient Privacy Rights’ (PPR TF) Trust Framework. Policies were further compared as a function of app category (free vs. paid; entertainment vs. social networking vs. utility). We found that the average reading grade level for the privacy policies we analyzed was higher (12.78) than the average reading grade level of adults in the United States (8.0) and higher than the PPR TF recommended level (12.0). In general, app policies did not differ in their readability as a function of category. Although users must agree to app privacy policies in order to access digital tools and products, readability analyses suggest these agreements are not comprehensible by the average adult, let alone youth.

Because companies often collect, use and sell users’ personal information, it is concerning that agreements describing and governing these activities are not accessible to most users. Given that youth are considered a vulnerable population, we propose that pediatricians and healthcare professionals could play a role in educating youth and their guardians about the use of online services and potential privacy risks, including the unintentional sharing of personal data.

UPTAKE OF AN INCENTIVE-BASED MHEALTH APPLICATION FOR CHRONIC DISEASE PREVENTION: PROCESS EVALUATION OF THE CARROT REWARDS APP

Marc Mitchell, Post-Doctoral Fellow[1], Lauren White, MSc[2], Paul Oh, MD MSc FRCPC FACP[1], David A. Alter, MD; Ph.D.,; F.R.C.P.(C)[3], Tricia M. Leahey, PhD[4], Guy Faulkner, PhD[5]

[1]University Health Network, Toronto, ON, Canada; [2]CARROT Insights Inc, Toronto, ON, Canada; [3]Toronto Rehabilitation Institute-University health Network, Toronto, ON, Canada; [4]University of Connecticut, Storrs, CT; [5]University of British Columbia, Vancouver, BC, Canada

Background: Behavioral economics has stimulated renewed interest in financial health incentives worldwide. The Carrot Rewards app was developed as part of a novel public-private partnership to reward Canadians with loyalty points (e.g., movies, groceries) for downloading the app, referring friends and completing one to two health quizzes per week ("micro-learning").

Objective: The main objective is to evaluate app uptake during the exclusive 3-month launch period in British Columbia (BC), Canada. The secondary aims are to describe the health and demographic characteristics of users, as well as engagement levels (i.e. proportion of quizzes completed).

Methods: The app was promoted via loyalty program email campaigns (1.64 million emails). Number of downloads and valid registrations (users enter age, gender and valid BC postal code to register) were collected. Additional demographics were inferred by linking postal codes with census data at the Local Health Area (LHA) level. A health risk assessment was also deployed. Engagement level was collected over three months and descriptive data are presented.

Results: In three months, 67,464 individuals downloaded the app – in its first week, the Carrot Rewards app was the most downloaded health app in Canada. Among 'active users' (*n*=57,885; at least one quiz completed), the majority were female (63%) and aged 18-35yrs (54%). More than half of users (52%) resided in LHAs where the median income is below the provincial average ($28, 765 Cnd). Sixty-four percent of users lived in metropolitan LHAs, compared to 56% of the general BC population. The most prevalent risk factors were *not* meeting physical activity guidelines (73%) and *not* getting the flu shot last year (68%). Regarding engagement, 21%, 7%, 13%, and 59% of users were classified as low (74%) engagers, respectively.

Conclusion: Early results suggest that loyalty points may promote mHealth app uptake and engagement. The impact of loyalty points on behavioral *outcomes* (e.g., steps/day, flu shot) are worth exploring.

BEHAVIORAL MEDICINE RESIDENT EDUCATION AND A FORMAT FOR CURRICULUM MODIFICATION

Jennifer Harsh, PhD, Tyler Lawrence, M.A. Professional Counseling

University of Nebraska Medical Center, Omaha, NE

Psychosocial problems are common in healthcare settings, with greater than 70% of patients seen in primary care visits presenting with a psychosocial comorbidity. Non-comorbid mental health and substance use disorders are anticipated to surpass physical disease as a cause of worldwide disability by 2020. Also, patient-provider interactions are important because they dictate relevant patient outcomes, affecting, for example, patient engagement in healthcare decisions and medication adherence.

Because of the prevalence of patient psychosocial difficulties and the importance of patient-provider interactions, we developed a behavioral medicine curriculum to assist residents in enhancing behavioral medicine-related knowledge and clinical skills. The two mainstays of the education program are monthly hour-long noon conference presentations and behavioral medicine seminars. Noon conferences consist of didactics, audience participation, and small group discussion. Topics are related to patient care in primary care and hospital settings. Examples include motivational interviewing techniques, approaches to working with difficult-to-treat patients, and brief systemically-focused interventions for depression and anxiety. During behavioral medicine seminar, a behavioral medicine faculty member meets with two to three residents to view recordings of patient-provider interactions for each resident in attendance. The faculty member facilitates discussion surrounding the presented patient cases, including strategies for agenda setting, building rapport, displaying empathy, and asking open-ended questions. The goal of the behavioral medicine seminar is to provide residents with feedback that can assist them with enhancing strategies for providing patient-centered care.

Following each behavioral medicine seminar and noon conference, residents completed a survey that contained questions on which behavioral medicine topics they plan to implement in their practice, which they would like to learn, and how useful the training was overall. Residents reported behavioral medicine education as being very useful. Findings from a

qualitative thematic analysis of open-ended survey questions highlighted Motivational Interviewing skills and agenda setting as topics which were particularly beneficial for their practice. Results also highlighted residents' desire to learn more about pain management strategies and engaging families in care in the future.

DELIVERY OF MOTIVATIONAL INTERVIEWING WORKSHOPS TO CLINICS SERVING VULNERABLE POPULATIONS

Lola Coke, PhD, ACNS-BC, RN-BC[1], Beth-Anne Christopher, MS, RN, CNL[2], Grantner Mary, MA, CHCP[1]

[1]Rush University Medical Center, Chicago, IL; [2]Rush University College of Nursing, LaGrange, IL

Background: With grant support, a large urban medical center has formed a collaborative partnership with a group of 13 Federally Qualified Health Centers to develop and implement a motivational interviewing curriculum for its health care providers, care coordinators and community health workers.

Purpose: Development, implementation and evaluation of a 4 hour tailored workshop with follow-up concordant testing to teach principles of motivational interviewing, coaching and relapse prevention techniques. Data was collected, pre-workshop, immediately post-workshop and 8 weeks post-workshop.

Results: Workshops were delivered to 13 sites (N=114 health care providers). The majority of participants were care coordinators (36.6% n = 37). Pre-workshop data showed that 94.3% were familiar with MI, but only 68.6% thought they could use the technique to encourage a commitment to change. Post -workshop data showed that compared to pre-workshop, participants felt better prepared to: 1) build collaborative partnerships (84.7% vs 98.2%; change increase 13.5%); and, 2) encourage patient commitment to change (68.6% vs 93.5%; change increase = 29.4%). Post-workshop barriers included: 1) uncomfortable with content (13.3%); 2) change is too time-consuming (33.7%); 3) patients are resistant to change (54.1%). At 8 weeks, participants (n = 28) reported they were all (100%) building collaborative relationships, and 93% were able to encourage patient commitment to change.

Conclusion: Each clinic valued the workshop as evidenced by high attendance, engagement and participation in long-term follow-up measures. Learner responses indicated that within this sample, the workshop was effective in moving participants to actual change in practice

and in effectively promoting patient change. Additional strategies include reinforcement of key learning objectives through-mail testlets and other on-going programing.

HPV VACCINATION TRAINING EXPERIENCE AND PREFERENCES AMONG FAMILY MEDICINE RESIDENTS AND FACULTY: A MIXED-METHODS STUDY

Monica Kasting, PhD[1], Paige W. Lake, BA[1], Courtney L. Scherr, PhD[2], Tracy Johns, PharmD, MS[3], Teri L. Malo, PhD, MPH[4], Richard Roetzheim, MD[5], Gwendolyn Quinn, Ph.D. [6], Susan Vadaparampil, PhD MPH[1]

[1]Moffitt Cancer Center, Tampa, FL; [2]Northwestern University, Chicago, IL; [3]USF-MPM Family Medicine Residency, Clearwater, FL; [4]UNC Lineberger Comprehensive Cancer Center, Chapel Hill, NC; [5]U. of South Florida, Tampa, FL; [6]Moffitt Cancer Center - USF, Tampa, FL

Background: Physicians in the U.S. do not consistently recommend human papillomavirus (HPV) vaccination for adolescents. Residency training is a pivotal time to establish skills for career-long practices, particularly for challenging skills such as HPV vaccine recommendation. We examined Family Medicine (FM) residents' and faculty's training experience and preferences related to delivering HPV vaccine recommendations.

Methods: Residents (n=28) and faculty (n=19) were identified through a national FM residency directory and recruited from training programs in Florida. Participants completed a phone interview assessing key aspects of HPV vaccine recommendation training. Interviews were audio recorded, transcribed verbatim, and analyzed using content analysis. A brief follow-up survey was emailed after the interview. Survey data were analyzed using descriptive statistics and faculty and resident responses were compared using Fisher's exact tests.

Results: *Qualitative*. Residents' training experience with HPV vaccination recommendation varied from none to extensive, and was often self-directed. Variation in training was seen between and within programs. Faculty often noted HPV vaccination training was not standardized and residents lacked instruction about effective communication. *Quantitative*. Most residents preferred to receive training focused on providing recommendations for HPV vaccine through formal lectures (86%). All faculty participants (100%) indicated this format was useful (p=0.14). Only 46% of residents indicated communication training was provided via formal lectures in their program, but 90% of faculty reported such training was available (p=0.005). Additionally, 79% of faculty thought videotaping residents recommending the vaccine would be a useful approach for training, whereas only 14% of residents preferred this method of instruction (p

Conclusions: Our study identified a lack of consistent and standardized training for delivering

HPV vaccine recommendations. A training curriculum that uses multiple modalities and reflects resident and faculty preferences is needed.

INCREASING BEHAVIORAL HEALTH & INTEGRATED CARE IN K-12 SCHOOLS

Lauren Bigham, Eds[1], JungSu Oh, M.Ed.[2], Jeffrey D. Okun, M.S., NCC[2], Dontavious Ford, M.Ed., NCC[3], Bernadette Heckman, PhD[2], Jolie Daigle, PhD, LPC[2]

[1]University of Georgia, Macon, GA; [2]University of Georgia, Athens, GA; [3]University of Georgia, Stockbridge, GA

Background: In Georgia, there is a critical lack of behavioral health professionals and services that results in children not receiving vital care. An urgent need exists to increase children's access to behavioral health services in Georgia's school systems via innovative school counseling training programs that move beyond generalist training. Guided by a biopsychosocial and multicultural framework, school counseling master's students are receiving training in behavioral health to place larger numbers of professionals in schools to mitigate the gaps to such services. **Objectives:** To evaluate this innovative training approach, the current study examines school counseling master's students' perceived self-efficacy and competency in the delivery of behavioral heath and integrated primary care services in school-based settings. **Research Design:** Funded by HRSA, this study reports on preliminary cross-sectional data collected from school counseling master's students (n=54) receiving training in a large southeastern public university. In addition to completing the School Counselor Self-Efficacy Scale and the Revised Multicultural Counseling Competence and Training Survey, students' completed the Readiness for Interprofessional Learning Scale and the Interprofessional Education Collaborative Competency Survey. **Results:** Analyses of baseline data suggests that master's level school counseling students maintained moderate levels of self-efficacy (Mean=3.03, Possible Range=1-5), valued providing multidisciplinary services in schools (Mean=4.30, Possible Range=1-5), were highly amenable to working with interdisciplinary professionals (Mean=3.47, Possible Range=1-5), and held a more positive view of interprofessional teamwork and collaboration (Mean=4.68, Possible Range=1-5). **Conclusions:** School counselors in training appear to be open to and value innovative training in the delivery of interprofessional and multicultural behavioral health services in K-12 schools. Future research will evaluate the long-term effectiveness and sustainability of this innovative training approach to increase access to behavioral health and integrated primary care services in K-12 schools.

INTEGRATING SIMULATION INTO TEAMSTEPPS TRAINING TO IMPROVE INTERPROFESSIONAL COLLABORATIVE PRACTICE

Patricia Francis-Johnson, DNP, RN, Sharon Decker, PhD, RN, ANEF, FAAN, Charles F. Seifert, Pharm.D., FCCP, BCPS, Brian Irons, PharmD, FCCP, BCACP, BC-ADM, Christina Esperat, RN, PhD, FAAN, Huaxin Song, PhD

Texas Tech University Health Sciences Center, Lubbock, TX

Background

Poor communication between health professionals has been identified as a major cause of care delay and poor team performance. Simulation-based activities have demonstrated the ability to facilitate collaboration and improve communication among interprofessional teams. TeamSTEPPS training has demonstrated the ability to improve interprofessional communication, and teamwork skills improving quality of care and patient safety. Therefore, the purpose of this project was to investigate how TeamSTEPPS training, which included clinic specific simulations, improved the communication and team behaviors of the clinic's interprofessional personnel.

Methods

An interprofessional group of identified leaders were designated as champions of the project and trained in TeamSTEPPS. Focus groups with the champions and clinic administration, along with findings from observations by the researchers identified challenges affecting patient care delivery. These challenges were integrated into the case scenarios for the simulation based activities. The health professionals in our nurse managed community health center were asked to complete this two-day training. A pre-post survey of the participants and observation by the researchers in both simulation and at the clinic setting were used to obtain data. Tools included: TeamSTEPPS Teamwork Attitudes Questionnaire, TeamSTEPPS Teamwork Perceptions Questionnaire, and the Collaborative Practice Assessment Tool (CPAT).

Results

The training improved teamwork attitudes significantly on overall scores and subscales for team structure, leadership, situation monitoring and communication. The training also improved teamwork perception on communication significantly. The CPAT subscale scores were found highly correlated to TeamSTEPPS Teamwork Attitudes Questionnaire subscale scores.

Discussion

The changes in patient care delivery has resulted in unsolicited positive comments by patients, and actual chronic disease management.

THE INTEGRATIVE HEALTH & LIFESTYLE PROGRAM (IHELP): IMPACT OF AN ONLINE INTERPROFESSIONAL CURRICULUM

Audrey Brooks, PhD[1], Molly Burke, N/A[2]

[1]University of Arizona Center for Integrative Medicine, Tucson, AZ; [2]University of Arizona, Tucson, AZ

Integrative health (IH) takes account of the whole person, including all aspects of lifestyle. It emphasizes the therapeutic relationship between practitioner and patient, is informed by evidence, and makes use of all appropriate therapies. The Integrative Health & Lifestyle Program (IHeLp) was developed to meet a training gap in IH approaches for allied health care professionals. IHeLp is 6-month, 250-hour interprofessional, online training program that aims to educate health and wellness professionals in an IH approach to patient/client care focused on addressing 7 core areas of health: Sleep, Movement, Nutrition, Relationships, Resiliency, Environment, and Spirituality. IHeLp targets licensed, registered, or certified allied health professionals with the goal of supporting interprofessional collaboration and well-trained IH care teams. Participants learn to utilize lifestyle modifications that improve health and wellbeing (nutrition, mindfulness, physical activity, complementary therapies, etc.) and techniques to motivate change and reduce stress with an emphasis on Self-Care as applied learning. IHeLp utilizes an online curriculum, weekly faculty mentor meetings, self-care teams, ongoing assignments, faculty-moderated dialogues, and 4-day experiential retreat. Knowledge-based exams assess attainment of learning objections. The program has 140 graduates. Mean score on the final exam was 91% (66-100% range). A final program evaluation survey assess overall experience. Items are rated on a 5-point scale (5 is most favorable) and the top 2 categories summed. The program evaluation was very positive with 97% finding the experience transformative, personally (100%) and professionally enriching (98%), and 97% felt able to apply learning to real-world situations. Pre- and post-course changes in burnout (Maslach Burnout Inventory), lifestyle behaviors (Arizona Lifestyle Inventory), emotional intelligence (Interpersonal Reactivity Index), and attitudes toward interprofessional collaboration (Attitudes toward Health Care Teams; ATHC) are examined. Statistically significant improvements ($p < 0.05$) were found for burnout, specific lifestyle behaviors in the areas of diet, mind-body practices, leisure, and sleep), and quality of care (ATHC). No differences were found for emotional intelligence, time constraints (ATHC) and some lifestyle behaviors. IHeLp is a unique, accessible option for allied health professionals to address interprofessional and IH training needs.

THE NATIONAL CENTER FOR INTEGRATIVE PRIMARY HEALTHCARE - ENHANCING INTERPROFESSIONAL INTEGRATIVE HEALTH EDUCATION

Audrey Brooks, PhD[1], Patricia Lebensohn, MD[2]

[1]University of Arizona Center for Integrative Medicine, Tucson, AZ; [2]University of Arizona, Tucson, AZ

Evidence is accruing for the clinical and cost-effectiveness of integrative healthcare (IH); however, there is a knowledge gap for primary care professionals, which has hindered widespread adoption of IH into the healthcare system. The University of Arizona Center for Integrative Medicine received a HRSA grant to establish the National Center for Integrative Primary Healthcare (NCIPH) to address this need. Based on a coordinated set of IH competencies across primary care professions and needs assessment, a 45-hour online interprofesssional IH course, Foundations in Integrative Health (FIH), was developed and pilot-tested in primary care training programs, e.g., family medicine, internal medicine residencies, nursing, pharmacy, behavioral health, oriental medicine, chiropractic. Units include: Introduction to IH in Primary Care; Prevention and Lifestyle Behavior Change; Healthcare Professional Wellbeing; Addressing Patients through an Integrative Lens in Primary Care; Integrative Interventions; Community Settings and Systems at Large. There were 2,200 course participants in the pilot, of which 696 (32%) completed the course. An evaluation survey administered at the end of each unit assesses whether objectives were met, educational depth, clinical utility, helpfulness of resources and reflections and ease of technology. Items are rated on a 5-point scale with 5 the most favorable. Met objectives (4.5), usefulness to patient care (4.2) and ease of technology (4.2) received the highest ratings. Helpfulness of sharing reflections received the lowest rating (3.2). When asked whether the unit should be incorporated into mandatory material, a majority (61-74%) rated the units as mandatory. A final course evaluation survey assesses interest in applying IH principles in practice, desire to seek additional IH education, whether course enhanced educational experience, recommend course to others, incorporation of self-care practices learned in the course, and site leader support for completing and relating course content to training. The FIH course experience received very high ratings with most interested in applying what they learned (4.5), continuing to seek IH education and training (4.3), and rated the course as enhancing their educational experience (4.3). Two-thirds (67%) reported incorporating new self-care practices into their lives based on what they learned in the course. The goal of NCIPH is to transform primary care health professional education to include an emphasis on providing an integrative approach to patient care utilizing an interprofessional collaborative team. The FIH course can serve as a foundation in this effort. An online course addresses the

challenges of time, cost, and curriculum consistency and can be widely disseminated to the entire spectrum of primary care training programs.

AWARENESS AND TRUST OF U.S. PUBLIC HEALTH AGENCIES: RESULTS FROM A NATIONALLY REPRESENTATIVE SAMPLE OF ADULTS AND ADOLESCENTS

Sarah Kowitt, MPH[1], Allison M. Schmidt, MPH[2], Anika Hannan, MPH student[3], Adam O. Goldstein, MD, MPH[4]

[1]University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Chapel Hill, NC; [2]Gillings School of Global Public Health, UNC Chapel Hill, Chapel Hill, NC; [3]Rollins School of Public Health at Emory University, Fayetteville, NC; [4]University of North Carolina at Chapel Hill, Chapel Hill, NC

Trust in government agencies plays a key role in advancing these organizations' agendas, changing health behaviors, and effectively implementing health policies. However, few studies have examined how individuals trust the leading U.S. agencies devoted to protecting the public’s health. Using two national samples of adults (*N*=1125) and adolescents (*N*=5014), we examined demographic factors, with a focus on vulnerable groups, that predicted awareness and trust of the Centers for Disease Control and Prevention (CDC), Food and Drug Administration (FDA), and the federal government. From nine different weighted logistic regression models, we found high levels of awareness of the FDA and CDC (ranging from 55.7% for adolescents’ awareness of the CDC to 94.3% for adults’ awareness of the FDA) and moderate levels of trust (ranging from a low of 41.8% for adults’ trust in the federal government and a high of 78.8% for adolescents’ trust of the FDA). With respect to awareness, across both adolescents and adults, being African American, of younger age, having lower education, and having low numeracy were all associated with lower awareness. With respect to trust in these agencies and the federal government as a whole, fewer demographic differences were found. This research provides key novel insights into the drivers of awareness and trust in the US federal government and its public health agencies. Our findings suggest groups that these agencies may want to target to enhance trust and thus facilitate their communication and regulatory agendas.

BLACK-WHITE RACIAL DIFFERENCES IN PATIENT-PHYSICIAN COMMUNICATION: A SYSTEMATIC REVIEW

Megan Shen, PhD[1], Emily B. Peterson, PhD[2], Rosario Costas-Muñiz, PhD[3], Carma Bylund, PhD[4]

[1]Weill Cornell Medicine, New York, NY; [2]National Cancer Institute, Rockville, MD; [3]Memorial Sloan Kettering Cancer Center, New York, NY; [4]Hamad Medical Corporation, Houston, TX

Background: Ample evidence exists for the presence of racial disparities in health care, but it is less clear what contributes to these disparities. Recent data suggests disparities in patient-provider communication may contribute to these racial disparities in health care. The goal of the present study was to systematically review studies examining the effect of race on patient-physician communication.

Methods: A comprehensive search was conducted across six online databases between 1995 and 2016. Studies were included when the sample consisted of patients in health care contexts and the communication outcome was observational or patient-reported. The search resulted in 4,672 records for review and 40 articles for final inclusion in the review. Studies were divided into eight main domains of patient-physician communication: (1) quality, (2) satisfaction, (3) information-giving, (4) partnership building, (5) patient participation and participatory decision-making, (6) positive and negative affect/talk, (7) length of visit/time and talk-time ratio, and (8) “other.”

Results: Studies were heterogeneous in health contexts and communication measures, but most results seemingly pointed to black patients having worse communication outcomes than white patients, although some results were mixed. These results were most consistent for quality, information-giving, and patient participation and participatory decision-making. Results were mixed for satisfaction, partnership building, length of visit, and talk-time ratio. Mixed results seemed to depend on the specificity of the communication measure as well as its consistency across studies.

Conclusions: Overall, results of this study indicate that black patients may both receive and perceive poorer communication than white patients. However, results also highlight the lack of consistent, valid measured used in the research literature and the need for more consistency across studies to illuminate these results. Nevertheless, results highlight the potential need to train physicians on how to engage in higher quality communication with black patients by focusing on improving their patient-centeredness, information-giving, partnership building, and engagement of black patients in communication processes.

COMMUNITY HEALTH IMPROVEMENT RESEARCH IN SOUTHWEST KANSAS: A QUALITY IMPROVEMENT PROJECT

Judy A. Johnston, MS, RD, LD[1], Lisette Jacobson, PhD, MPA, MA[2], Liuqiang (Kelsey) Lu, MS[2], David F. Gamble, Bachelor of Science in Education[3], Sarah Weber, Bachelor of Business Administration, May 2018[4], Jacob Rha, N/A[5], Gillian Jolly, Bachelor of Science[6]

[1]University of Kansas School of Medicine -Wichita, Wichita, KS; [2]University of Kansas School of Medicine-Wichita, Wichita, KS; [3]Baylor University, Estes Park, CO; [4]Baylor University, Colorado Springs, CO; [5]Baylor University, Carrollton, TX; [6]Baylor University, Madison, MS

Background: In the United States, quality improvement (QI) initiatives mainly focus on the health of urban populations and usually target one specific disease or health concern such as mental health, cardiovascular disease, childhood obesity, the healthcare system, or a sub-population. There are no studies that have assessed the health needs of an entire community by economic sector. The purpose of this study was to assess community members' perceptions, knowledge, attitudes, and desires related to health and wellness resources in an extremely frontier rural region (referred to as "county") of a Midwestern state.

Methods: Households in the two largest cities of this county, with 235 and 781 households respectively, were targeted to complete the assessment. The county had a total of 1,341 households. The research team trained 45 volunteers who went door-to-door to collect one survey per household. The survey instrument was available in English and Spanish. Survey questions focused on availability of health and wellness (h/w) services in the county and h/w services offered at the worksite, daycare/preschool, public school, church, county extension office, and at the community-level. Incentives were provided. Data were collected in July/August, 2016. Descriptive analyses were conducted.

Results: With 865 surveys completed, the cities' response rate - 85.1%; total county response rate - 64.5%. The majority of respondents were female (72.9%), age 25-44 (39.3%), earned \$10,000-\$50,000/year (32.3%), and non-Hispanic white (64.7%) followed by Hispanic (27.3%). The majority of participants (41.1%) defined health and wellness as an "active, lifelong process of becoming aware of choices and making decisions toward a more balanced and fulfilling life," and 60.9% reported that "health/wellness is influenced by the environments where I live, learn, work, play and pray." About 44.7% reported that they partially agreed with the statement "the healthcare system is responsible for my health/wellness" followed by 32.8% who disagreed with this statement. Participants identified after-hours non-emergency

care, weight management coaching, and mental health services as the top three most important community priorities.

Conclusion: This community health assessment is a first step toward enhancing the quality of h/w resources provided to rural residents. Follow-up studies are needed to identify feasible interventions thereby improving health and wellness for this population.

DEVELOPMENT AND VALIDATION OF AN ENVIRONMENTAL HEALTH LITERACY ASSESSMENT TOOL

Veronica Irvin, PhD, MPH, Diana Rohlman, PhD, Amelia Vaughn, BA, Rebecca Amantia, MPH, Molly Kile, ScD

Oregon State University, Corvallis, OR

Introduction: Private well users in the US have access to well water testing assistance through their county health departments. Though many citizens take advantage of this oppurtunity, few follow through with treatment if they receive negative test results. A potential barrier to treatment could be a lack of environmental health literacy. Environmental health literacy integrates concepts from both environmental literacy and health literacy to develop skills and competencies needed to seek out, comprehend, evaluate, and use information to make informed choices, reduce health risks, improve quality of life and protect the environment. However, measures of environmental health literacy have not been developed.

Methods: The purpose of this presentation is to describe the development of an environmental health literacy (EHL) assessment tool and to assess the relationship of the EHL against a validated health literacy scale administered in clinic settings, the Newest Vital Sign (NVS). We used crowd sourcing techniques to administer the survey online to a sample of US adults ages 18 and older. The two different measurement tools were compared on 1) absolute values, 2) ranking ability in tertiles, and 3) Bland-Atlman plots with limits of agreement.

Results: A total of 911 adults started the survey, 95% completed it for a final sample of 865. Participants were 57% female, 86% college-graduates, 53% home owners and reported a mean age of 37.8 (SD=11.5). Both surveys averaged between 2 – 2.5 minutes to complete. Scores ranged from 0-6 for both tools. Mean score was 5.0 (SD=1.2) for the standardized NVS and 5.0 (SD=1.0) our EHL measure. Cronbach alpha for our EHL measure was alpha=0.51. Correlation between both measures was r=0.468, p < 001. The number of participants in the top tertile (score of 5 or 6) was 78% for both NVS and EHL with a percent agreement of 74.5% across all tertiles. Histograms and Bland-Altman plots will be included in poster presentation.

Conclusions: The EHL was quick to administer and easy to complete. The EHL measure had similar distributional properties and ranking abilities to the standardized NVS health literacy measure. This tool should be tested in populations with lower access to internet or lower educational attainnment. An assessment tool for environmental health literacy could identify participants at low environmental literacy and aid with intervention development to improve home environmental hazards.

GOOGLE ANALYTICS USAGE IN THE STUDY OF AN ONLINE PROGRAM DESIGNED FOR PROSTATE CANCER SURVIVORSHIP

Sara Fleszar, N/A[1], Alexander Adia, N/A[2], Gianna M. Torre, BA[1], Erin K. Tagai, PhD, MPH[3], Simon Hall, MD[4], Manish Vira, MD[4], Alexander Kutikov, MD[3], David Y.T. Chen, MD[3], Curtis Miyamoto, MD[5], Adam Reese, MD[6], Suzanne M. Miller, PhD[7], Shawna Hudson, PhD[8], Michael A. Diefenbach, Ph.D.[1]

[1]Northwell Health, Manhasset, NY; [2]Northwell Health, Wantagh, NY; [3]Fox Chase Cancer Center, Philadelphia, PA; [4]Northwell Health, New Hyde Park, NY; [5]Fox Chase Cancer Center at Temple University Hospital, Philadelphia, PA; [6]Lewis Katz School of Medicine/Temple University Hospital, Philadelphia, PA; [7]Fox Chase Cancer Center/Temple University Health System, Philadelphia, PA; [8]Rutgers Robert Wood Johnson Medical School, New Brunswick, NJ, New Brunswick, NJ

Introduction: Google Analytics (GA) is a powerful tool to analyze web-based software usage. While GA is widely used as a business tool, it has only sparsely been used in behavioral research. GA was used as part of a larger trial to test the efficacy of PROGRESS, an online multimedia program for prostate cancer survivorship. PROGRESS was designed to boost coping and adjustment in prostate cancer survivors post treatment. **Methods:** GA enabled tracking of individual user behavior within the PROGRESS website, recording accessed pages, videos and downloaded documents. Usage was then related to common demographic variables. **Results:** Users were mostly white (77%), married (83%), and well-educated (76%). Of the 162 patients who received access to the website, 78 (48%) participants logged on and viewed multiple pages. There was no association between users and non-users along race, marital status, and education variables. The most popular feature on the website was the Health Tracking Tool, which allows users to track their sleep, moods, and recovery of erectile functioning. Other popular features were informational pdfs to construct a personalized survivorship care plan (e.g. treatment information, follow-up care, and post-treatment health changes), accessing external information of prostate cancer-relevant exercises (yoga & Kegels), and a collection of physician and patient videos. **Discussion:** We succeeded in our goal to create a web based support tool that was attractive to users across demographic groups. Patients preferred interactive components, such as the health tracking tool, and informational content that allowed them to record personalized information relevant for future follow-up care (i.e., survivorship care plan). Measuring website usage in real time through an online tool, such as GA, provides important information about patient needs and

behaviors. The use of real-time access data reveals patient needs that are far more accurate than retrospective reporting of usage.

IMPACT OF AMERICAN SIGN LANGUAGE EDUCATION VIDEOS ON NUTRITION AND EXERCISE KNOWLEDGE AMONGST THE DEAF COMMUNITY

Luis Mandujano, N/A[1], Sandy Bohan, MPH[2], Matthew Fager, N/A[3], Patricia Branz, N/A[3], Vanessa L. Malcarne, Ph.D.[4], Georgia Sadler, Ph.D[5]

[1]University of California, San Diego, La Jolla, CA; [2]San Diego State University/University of California, San Diego Joint Doctoral Program in Public Health, La Jolla, CA; [3]University of California, San Diego Moores Cancer Center, La Jolla, CA; [4]San Diego State University, San Diego, CA; [5]University of California, San Diego Moores Cancer Center, San Diego, CA

Reducing obesity and cardiovascular disease are public health goals. Studies support improving nutrition and exercise knowledge to promote weight loss and physical activity. The Deaf community faces communication barriers that hinder education efforts, such as limited English proficiency and limited health terminology available in American Sign Language (ASL). Intervening with culturally competent education about nutrition and exercise in ASL is needed to overcome these communication barriers. In this study, Deaf-relevant education videos in ASL were created to improve nutrition and exercise knowledge amongst the Deaf community. The aim of this study was to test whether positive changes in nutrition and exercise knowledge resulted from exposure to the education videos. We enrolled 215 Deaf men and women. Enrollees were randomly assigned to one of two intervention groups: nutrition or exercise video. Each group served as controls for the other group. Participants completed a demographic survey, a nutrition knowledge test, and an exercise knowledge test. Knowledge tests were completed at pre- and post-intervention and two months afterwards. Descriptive statistics were presented as means and standard deviations. Repeated measures models within linear mixed-effects models compared changes in knowledge test scores between groups. The sample that completed the study consisted of nearly equal numbers of Deaf men and women, between 18 and 87 years of age ($N = 190$; $M \pm SD$: 42 ± 16 years). They were mostly non-Hispanic White and had completed education beyond high school. Nutrition knowledge test scores can range from 0 to 17; exercise knowledge test scores, from 0 to 12. Higher scores indicate higher knowledge. The nutrition group gained nutrition knowledge after viewing the education video, and retained knowledge after two months ($M \pm SD$: pre, 8.9 ± 2.7; post, 11.0 ± 2.3; two months, 10.5 ± 2.8). The exercise group also gained and retained exercise knowledge ($M \pm SD$: pre, 5.7 ± 1.9; post, 8.0 ± 1.8; two months, 6.8 ± 1.9). Adjusting for age and education level, nutrition knowledge test scores increased by 0.8 ($F(1, 379) = 67.2$, $p < 0.0001$) and exercise knowledge test scores increased by 0.5 ($F(1, 379) = 33.9$, $p < 0.0001$) from pre-intervention. However, the nutrition group did not score differently on the nutrition

knowledge test than the controls. Exercise knowledge scores amongst the exercise group were generally higher by 1.05 than that of the controls ($F(1, 184) = 22.2$, $p < 0001$). ASL education videos are a promising tool to communicate nutrition and exercise information to the Deaf community. Exposure to the ASL exercise education video resulted in modest improvements in exercise knowledge. Further study is needed to explore the impact of the ASL education videos on promoting healthy dietary and exercise behavioral changes.

PERCEPTIONS OF ADDICTIVENESS OF WATERPIPE TOBACCO AMONG YOUNG ADULT WATERPIPE TOBACCO USERS

Darren Mays, PhD, MPH[1], Kenneth P. Tercyak, PhD[1], Isaac Lipkus, PhD[2]

[1]Georgetown University Medical Center, Lombardi Comprehensive Cancer Center, Washington, DC; [2]Duke University School of nursing, Durham, NC

Waterpipe tobacco is a commonly used tobacco product among U.S. young adults, linked to symptoms of nicotine dependence and acute and long-term negative health effects. Very little research exists as to how to design and deliver public health messages to prevent and reduce waterpipe tobacco use among young adults. To this end, this study investigated young adult waterpipe tobacco users' perceptions of the addictiveness of waterpipe tobacco and preferences for waterpipe tobacco messaging. Young adults (n = 44, M age 25.3 years, 52% female, 80% white) who had used waterpipe tobacco in the past month completed a brief, cross-sectional online survey. Closed-ended measures assessed demographics, waterpipe and other tobacco use, and perceived addictiveness of waterpipe tobacco. Open-ended items measured additional perceptions of addictiveness of waterpipe tobacco and preferences for waterpipe tobacco messages. Quantitative data were analyzed descriptively, and open-ended data were coded using an iterative, constant comparison method to identify emerging themes. Most participants used waterpipe tobacco monthly (59%); 86% also used one or more other tobacco product. Participants averaged 4.0 (*SD* 2.0, range 0-13) on a waterpipe tobacco dependence measure, but reported low perceived addictiveness (*M* 2.0, *SD* 0.9, range 1-4), low perceived chances of becoming addicted (*M* 3.0, *SD* 1.6, range 1-7), and low desire to quit (*M* 3.0, *SD* 1.8, range 1-7). Open-ended data indicated participants believe intermittent social use does not lead to addiction and that they can easily quit. However, some participants expressed concerns that waterpipe tobacco addiction may lead to health harms, social stigma, and financial costs. Participants indicated messages emphasizing negative health effects, using attention-grabbing imagery, and conveying that waterpipe users are at risk of long-term tobacco use would motivate cessation. Despite reporting moderate levels of waterpipe tobacco dependence, study participants largely viewed that waterpipe tobacco is not addictive. Messaging vividly conveying the health harms and risk of long-term addiction may be optimal to reduce waterpipe tobacco use.

PROMOTING HEATH AMONG MILITARY FAMILIES: 5210 HEALTHY MILITARY CHILDREN

Jennifer M. DiNallo, Ph.D.[1], Erica Rauff, PhD[2], Daniel F. Perkins, Ph.D.[3]

[1]Pennsylvania State University, Boalsburg, PA; [2]Pennsylvania State University, Seattle, WA;
[3]Pennsylvania State University, State College, PA

Background: Disseminating evidence-informed health promotion strategies to parents has the potential to improve health and decrease the prevalence of obesity among children. The *5210 Healthy Military Children campaign* (HMC) is designed to spread a consistent health message throughout Military communities. The campaign emphasizes “5” + fruits and vegetables, “2” hours or less of recreational screen time, “1” + hours of vigorous physical activity, and “0” sweetened drinks.

Methods: An effectiveness-implementation Hybrid Type III design (Curran et al., 2012) study was conducted among six military installations, where 15 venues (e.g., child development centers and commissaries) at each site were targeted by the *5210 HMC* campaign using venue-specific toolkits, posters, social media messaging, and flyers. The Point of Contact at each installation was trained on content and campaign implementation strategies via a 7-module online training. Opt-in text based surveys were used to evaluate the impact of the campaign on awareness, knowledge, and health behaviors at 0, 4, 8, and 12 months.

Results: Survey participants were 115 adults, with the majority 25-40 years (61%), female (71%), and with children (60%). Most people opted in to participate at a medical center (29%) or via social media (23%). At baseline, 78% of participants were not aware of the 5210 message. Most participants indicated that they **sometimes** ate 5+ fruits/vegetables daily (61%), **sometimes** spent more than 2 hours a day watching television, playing video games, or surfing the web (42%), **always** spent 1 + hours engaging in daily physical activity (39%), and **rarely** drank sweetened beverages daily (40%). Parental reports of their children’s behaviors mirrored those of their own behaviors. Although attrition in the study declined over the 12-month period, for those remaining, awareness and knowledge of the 5210 message increased, with no change in behavior.

Discussion: Dissemination and implementation research seeks to translate knowledge into practice. Improving the quality and consistency of health promotion messaging may improve family and child health outcomes. This pilot study produced a wide array of lessons learned

and next steps in implementing and evaluating an evidence-informed health promotion campaign in a military context.

PUBLIC UNDERSTANDING OF THE PURPOSE AND LIMITATIONS OF CANCER SCREENING: DATA FROM HEALTH INFORMATION NATIONAL TRENDS SURVEY 4

Rebekah H. Nagler, PhD[1], Sarah Parvanta, PhD, MPH[2], Seth K. Goldman, Ph.D.[3]

[1]University of Minnesota, Minneapolis, MN; [2]RTI International, Research Triangle Park, NC; [3]University of Massachusetts Amherst, Northampton, MA

In recent years, questions about the appropriate use of cancer screening—including whether and when screening's risks may outweigh its benefits—have risen to the fore. One such risk is overdiagnosis, which refers to a diagnosis of cancer that would otherwise never have caused symptoms or death in a person's lifetime. Although debates about the value of cancer screening find their way into media coverage, we know little about public understanding of these issues or whether there are significant communication inequalities in social groups' ability to access, understand, and act on this information. Using weighted data from the National Cancer Institute's Health Information National Trends Survey (HINTS 4, Cycle 4; N=3,677), we find that public understanding of the purpose and limitations of screening varies. Most respondents (91.2%) agreed that "when a [screening] test finds something abnormal, more tests are needed to know if it is cancer." However, only one-quarter (28.2%) correctly identified as false the statement that "These tests can definitively tell that a person has cancer." Even fewer (20.0%) recognized that "the harms of these tests and exams sometimes outweigh the benefits," despite evidence that this is true for certain screening modalities, such as prostate-specific antigen testing. Importantly, screening perceptions were socially patterned: Respondents with more education and income were more likely to agree that screening tests cannot definitively tell that a person has cancer ($p < .001$), and while "don't know" responses were frequent overall, this was particularly true among respondents of lower socioeconomic position (SEP). Given ongoing debates about the value of screening and concerns about overdiagnosis, it is important for providers to help patients understand screening's risks and benefits so they can make informed decisions. This is particularly critical for lower SEP and other underserved populations, given persistent communication inequalities. Additional implications of study findings for behavioral interventions will be discussed.

RATIONALE, PROCEDURES, AND RESPONSE RATES FOR THE 2015 ADMINISTRATION OF NCI'S HEALTH INFORMATION NATIONAL TRENDS SURVEY

Kelly D. Blake, ScD[1], David B. Portnoy, PhD, MPH[2], Annette Kaufman, PhD, MPH[3], Chung-Tung Jordan Lin, Ph.D.[4], Serena Lo, PhD[5], Eric L. Backlund, M.S.[6], David Cantor, Ph.D.[7], Lloyd Hicks, MS[8], Amy Lin, MS[7], Andrew R. Caporaso, MS[7], Terisa Davis, MPH[7], Richard P. Moser, PhD[9], Bradford W. Hesse, PhD[10]

[1]Behavioral Research Program, Division of Cancer Control and Population Sciences, National Cancer Institute, National Institutes of Health, Bethesda, MD; [2]Food and Drug Administration, Center for Tobacco Products, Silver Spring, MD; [3]Tobacco Control Research Branch, Behavioral Research Program, Division of Cancer Control and Population Sciences, National Cancer Institute, National Institutes of Health, Rockville, MD; [4]FDA Center for Food Safety and Applied Nutrition, College Park, MD; [5]Center for Food Safety and Applied Nutrition, Food and Drug Administration, Washington, DC; [6]U.S. Food and Drug Administration, Silver Spring, MD; [7]Westat, Rockville, MD; [8]Westat Inc, Rockville, MD; [9]National Cancer Institute, Bethesda, MD; [10]National Cancer Institute, Rockville, MD

Background: The National Cancer Institute (NCI) developed the Health Information National Trends Survey (HINTS) to monitor population trends in cancer communication practices, information preferences, health risk behaviors, attitudes, and cancer knowledge. The US Food and Drug Administration (FDA) recognized HINTS as a unique data resource for informing its health communication endeavors, and partnered with NCI to field HINTS-FDA 2015. **Methods:** HINTS-FDA 2015 was a self-administered paper instrument sent by mail May 29-September 8, 2015 using a random probability-based sample of US postal addresses, stratified by county-level smoking rates, with an oversample of high and medium-high smoking strata to increase the yield of current smokers responding to the survey. **Results:** The response rate for HINTS-FDA 2015 was 33%, N=3738. The yield of current smokers (N=495) was lower than expected, but the sampling strategy achieved the goal of obtaining more former smokers (N=1132). **Conclusion:** The public-use HINTS-FDA 2015 data and supporting documentation are available for download and secondary data analyses as of June 2016 at http://hints.cancer.gov. NCI and FDA encourage the use of HINTS-FDA for health communication research and practice related to tobacco-related communications, public knowledge, and behaviors, as well as beliefs and actions related to medical products and dietary supplements.

RESOURCES FOR RESEARCHERS: A NEW PORTAL TO ASSIST PREVENTION INVESTIGATORS

Deborah Langer, MPH, Jody Engel, MA, RD, Elizabeth Neilson, PhD, MPH, MSN, Andrey Kuzmichev, PhD, Murray David, PhD

National Institutes of Health, Office of Disease Prevention, Rockville, MD

Background

The Office of Disease Prevention (ODP) is the lead office at the National Institutes of Health (NIH) responsible for assessing, facilitating, and stimulating research in disease prevention and health promotion, and disseminating the results of this research to improve public health. Increasing the scope, quality, dissemination, and impact of prevention research supported by the NIH is central to the ODP's mission.

Methods

To assist the extramural research community to develop quality research projects that address a wide range of research needs, gaps, and priorities, the ODP has created a new online information portal: Resources for Researchers. This dissemination effort, which incorporates domains and strategies from the Framework for Knowledge Translation, aims to increase investigator capacity and lead to research that informs improved clinical practice, health policy, and community health programs. The ODP collected information from NIH's Office of Extramural Research, Center for Scientific Review, and other Institutes and Centers to develop this portal. The ODP also collaborated with the Agency for Healthcare Research and Quality and the Centers for Disease Control and Prevention to provide information on research gaps identified through rigorous systematic reviews by the U.S. Preventive Services Task Force and the Community Preventive Services Task Force.

Results

Resources for Researchers provides investigators with a variety of tools and resources including (1) instructions for finding NIH-funded research projects; (2) directions for applying for NIH funding; (3) a list of prevention-related funding opportunity announcements; (4) a list of methods-related funding opportunity announcements; (5) a directory of prevention-related NIH programs and offices; (6) a list of prevention-related study sections at the NIH; (7) an innovative database that is manually curated by experts, keyword-searchable, and categorized by research topics; (8) a comprehensive list of resources to assist dissemination and implementation researchers; and (9) information on high-priority evidence gaps identified by the U.S Preventive Services Task Force and the Community Preventive Services Task Force. The information about evidence gaps provides investigators seeking new topics of inquiry with a selection of understudied areas in prevention science.

Conclusions

Resources for Researchers combines prevention-related information across various NIH websites with newly created tools and materials in one online repository specifically tailored to the needs of the prevention research community. This dissemination effort is intended to build investigator capacity and has shown to be a useful resource for prevention researchers, particularly new investigators.

SOCIAL AND COMMUNICATION NETWORKS, CANCER INFORMATION, AND SELF-COLLECTED HPV TESTING AMONG WOMEN IN APPALACHIAN KENTUCKY

Katherine S. Eddens, PhD, MPH[1], Jesse M. Fagan, MA[2], Tom Collins, BS[3]

[1]University of Kentucky College of Public Health, Lexington, KY; [2]University of Kentucky Gatton College of Business and Economics, lexington, KY; [3]University of Kentucky Rural Cancer Prevention Center, Lexington, KY

In Appalachian communities, social networks are powerful community ties. However, there are few studies that examine how these network ties might be used to communicate information and norms about cancer screening and prevention behaviors. This study explores peer word-of-mouth communication networks in rural Appalachian women who have used self-collected vaginal swab (SCVS) for HPV testing, an innovative screening methodology in this population. The goal is to investigate how best to activate networks to disseminate cancer prevention and screening information, specifically innovative screening methodologies, in rural Appalachia. Network interviews were conducted with 50 women in Appalachian Kentucky who have not had a Pap test in three or more years, and 34 members of their networks (alters). Community health workers conducted interviews in the field using tablet-based softwarefor guided network data collection. They obtained information about participant's social and communication networks, study referral activity, source of health information and health care services, and characteristics of participant's network members (alters) and their relationships. Participants seek health information from health care providers (HCP; 51%), the internet (25%), and family and friends (16%), but get cancer information primarily from the internet (30%), followed by HCP (21%), and friends and family (11%). Of the 80% of participants that use the internet, most (67%) access it from a smartphone. Preliminary network descriptives show a mean network size of 12.6 alters (median 9, range 2-27) and a mean network density of 0.67 (median 0.63, range 0.13 – 1.00). However, 43% of participants have networks with a density of 1.00, meaning everyone in their network knows one another. This type of dense network structure can limit access to new information and resources, such as innovative cancer screening methodologies. Additional results will include communication network characteristics, what type of network characteristics distinguish women who refer others to SCVS testing, and whom they refer. Determining how network structure and content influences access to cancer information and cancer prevention norms can allow public health practitioners to tailor dissemination interventions in peer networks in low-income, marginalized populations such as rural Appalachian women.

TAILORED HEALTH COMMUNICATION FOR PRECLINICAL ALZHEIMER'S DISEASE

Jonathan Gooblar, MA

VA Palo Alto Health Care System, Palo Alto, CA

Educating patients about symptoms, prognosis, and treatment of disease is a cornerstone of competent patient care. Tailored Health Communication (THC) accounts for an individual's preferences, characteristics, and needs in the education process. The present study examines the influence of individual differences on the effectiveness of an educational protocol about preclinical Alzheimer's disease (pAD), a novel at-risk diagnostic category. A total of 581 adults between the ages of 18 and 65 were recruited on Amazon Mechanical Turk (50.8% female; 64.9% Caucasian; mean age=37.32 years). Participants were randomly assigned to one of three education conditions: education-as-usual (EAU; basic disease information); learning-to-criterion-basic (LTCbasic; basic disease information plus criterion learning); and learning-to-criterion-extended (LTCextended; basic disease information plus in-depth risks, benefits, and limitations plus criterion learning). Participants responded to two knowledge questions, and LTCextended participants responded to two additional in-depth knowledge questions. Participants also reported on their level of education, health literacy, experience with AD, and knowledge about AD. N=283 participants (51.3%) responded correctly to the knowledge questions. On the two basic knowledge questions, performance in the LTCextended condition was significantly better than in the other conditions. On the two basic knowledge questions, performance in the LTCextended condition was significantly better than in the other conditions ($\chi^2(2, N=581)=40.80$, $p < .001$). Participants in the LTCextended intervention reported lower levels of interest in obtaining predictive testing for AD compared to participants in the other interventions ($F(2,581)=11.31$, $p < .001$, partial η2=.038). Individual differences affected performance on the knowledge questions ($\chi^2(11)=94.75$, $p < .001$), with health literacy (lower confidence in filling out medical forms and few problems learning about medical conditions) and higher objective AD knowledge predicting better performance. More experience with AD predicted higher interest in obtaining testing for AD ($F(1,570)=8.09$, $p=.005$, partial η2=.014) with education condition in the model. Overall, participants' knowledge of this complex diagnostic category depended on individual difference variables and type of education. This study provides preliminary evidence for the effectiveness of THC in education for pAD.

WHAT (PREGNANT) WOMEN WANT: RESULTS FROM A WEB-BASED NEEDS ASSESSMENT OF WEIGHT-RELATED MOBILE APP MOTIVATIONS AND EXPERIENCES

Alicia A. Dahl, MS[1], Brie Turner-McGrievy, PhD, MS, RD[2], Sara Wilcox, PhD[2], Jihong Liu, Sc.D.[2], Rachel Davis, PhD[2]

[1]University of South Carolina, West Columbia, SC; [2]University of South Carolina, Columbia, SC

BACKGROUND: Technology has revolutionized the way people communicate. Mobile applications (apps) and websites hold potential as a convenient, readily available, and personalized resource for women during pregnancy. Electronic health (e-health) interventions could be used as a parallel or supplemental tool to deliver pregnancy weight-related information.

METHODS: Using Facebook and Twitter social media sites, pregnant women living in the United States who owned a smartphone were recruited to complete a brief one-time online survey regarding the needs and interests of pregnant women to guide the development of an e-health intervention. The survey included questions regarding pregnancy history, weight-related knowledge and behaviors, topics discussed with health care practitioners, information sought by pregnant women, and interests in electronically delivered health information. Descriptive statistics were used to summarize the data.

RESULTS: A total of 330 pregnant women completed the survey, and 327 participants self-reported pre-pregnancy height and weight (mean BMI =26.1+6.5). Half of the participants (50.6%) reported that they did not receive recommendations for healthy gestational weight gain (GWG) from their physicians during pregnancy. Ninety-one percent reported that they did not receive counseling on weight-specific information but 37.3% indicated interest in receiving such information during their pregnancy from a doctor, nurse, or other health care worker. Participants reported receiving their nutrition and physical activity information from websites (59.9%), a doctor (49.5%), friends/family (40.7%), cell phone apps (23.9%), a nurse/health care worker (23.5%), blog posts (21.1%), social media (18.3%), or books/magazines (16.8%). When asked about interest in receiving health information via electronic resources, 73% of participants were interested in podcasts, online group-based nutrition challenges (75.5%), group-based exercise challenges (76.9%), and mobile apps (81.5%). Moreover, 83.9% were interested in a mobile app for tracking GWG, and 87.3% reported use of pregnancy apps.

CONCLUSIONS: Participants from social media sites reported high use of electronic resources during pregnancy for health-related information. Focusing e-health interventions around weight management information and GWG tracking may fill a need in prenatal care. Future development of e-health interventions using websites or mobile apps would be beneficial for pregnant women.

FEAR OF DEPORTATION AND ITS EFFECTS ON HEALTH SERVICE USE AMONG LATINO IMMIGRANT MEN WHO HAVE SEX WITH MEN

Thespina Yamanis, Ph.D., MPH[1], Maria Cecilia Zea, Ph.D.[2], Suyanna Linhales Barker, Dr. Sc.[3], Allison O'Rourke, MPH[1], Ana Maria del Rio Gonzalez, Ph.D.[2]

[1]American University, Washington, DC; [2]The George Washington University, Washington, DC; [3]La Clínica del Pueblo, Washington, DC

Introduction. In the past fifteen years, there has been a 600% increase in the number of deportations, yet few studies have explored fear of deportation and how it affects health disparities. Fear of deportation may be conceptually related to 'vigilance', the everyday anticipation of discrimination by African-Americans. Research is needed to understand how fear of deportation impacts health care use among young Latino men who have sex with men (MSM), the Latino population at highest risk for HIV, for whom health care avoidance could result in swifter progression to AIDS and increased HIV transmission.

Methods. We conducted in-depth interviews with 18 non-US citizen immigrant Latino MSM aged 18-34 who live in the Washington, DC metro area. We asked about places and circumstances where they feel unsafe, experiences with immigration authorities, and use of health services. Interviews were conducted in Spanish for up to 90 minutes. Verbal consent was obtained. Data were protected through a federal Certificate of Confidentiality.

Results. Nearly all participants were from Central America (El Salvador, Honduras, and Mexico). Their average age was 25. The average length of time the participants were in the US was 6.4 years (range 0.2 year – 18 years). Eleven participants were undocumented (without legal papers to live/work in the U.S.) and were undergoing a legal process to adjust their immigration status, six were undocumented with no legal process, and one was a permanent resident. Five participants were HIV positive. Most participants described being worried about deportation because of violence, threats of death, and discrimination in their countries of origin. Some reported anxiety due to recent raids on undocumented immigrants. Participants' fears resulted in avoiding certain activities, including driving, going out late at night, and traveling to other states. As one participant explained: "I don't leave the apartment. I only go out for important things. This [fear of deportation] is something that you always have on your mind. It is very different for someone who has papers. They can go out to the places they want." Thirteen participants had health insurance, mostly through DC Health Care Alliance, one of the few state-sponsored programs that provides health insurance for the

undocumented. One undocumented participant became unemployed after lacking medical care for an injury. A few participants were afraid to access health care for fear they would encounter law enforcement and be deported, including one participant who was HIV positive.

Conclusion. The persistent threat of deportation generated everyday stress for our participants and contributed in some cases to their avoidance of health services. We will discuss how these qualitative themes have been translated into survey items for further measurement and testing among immigrant Latino MSM.

GENERATIONAL DIFFERENCES IN SEXUAL BEHAVIORS AND PERCEPTIONS AMONG GAY, BISEXUAL, AND QUEER MEN IN RURAL AREAS OF THE USA

Natalia Truszczynski, MPH[1], Danielle N. Lambert, MPH, CHES[2], Anne Marie Schipani-McLaughlin, MPH[1], Carolyn Lauckner, PhD[1], Nathan Hansen, PhD[1]

[1]University of Georgia, Athens, GA; [2]University of Georgia, Atlanta, GA

Background: Gay, bisexual, queer and other men who have sex with men (GBQ men) have been put into one monolithic group, MSM (men who have sex with men), when considering sexual risk. However, there are many factors that create differences of risk among GBQ men, including age. For example, older GBQ men may perceive HIV transmission as more likely and deadly than younger gay man due to growing up during the 1980/90s AIDS crisis.

Methods: This qualitative study explored the health, relationships, and technology use of GBQ men in rural areas of the United States. Eligibility criteria included identifying as a man who experiences attraction to other men, residing in a rural area, and being at least 18 years old. In total, 20 semi-structured interviews were conducted from July 2015 to June 2016. Interviews were transcribed verbatim and analyzed in NVivo 11 by a diverse coding team using grounded theory approach.

Results: Themes of generational differences were common throughout the interviews. Most men who were 35 years of age or older, described feeling as if younger men, usually under 18 years of age, did not perceive sexual risk as severe and did not fear HIV/AIDS. They described younger men as more willing to engage in unsafe sex, and even ask their partners to forego protection, either for pleasure or to actually help transmission of the disease. Additionally, older men perceived younger GBQ men to engage in more casual sex and to be less focused on pursuing long-term relationships than older GBQ men. Young GBQ men felt pressure to commit and be in relationships, and often rejected those pressures. Lastly, almost all older GBQ men shared stories of being asked to be younger men’s “silver daddies,” where the partners would have unprotected, casual sex. These propositions were universally met with disdain.

Conclusion: Understanding how young GBQ men perceive HIV/AIDS and transmission are important in creating effective interventions to reduce transmission of HIV. Interventions can no longer just focus on reducing barriers and increasing knowledge; instead we have to additionally focus change perceptions of risk and safety. Interventions should also be tailored

toward different generations of GBQ men, adolescents, young adults, and older adults, as all groups view sexual and relationships risk differently.

MERITORIOUS AWARD WINNER

HIV TESTING AVOIDANCE: PSYCHOSOCIAL FACTORS AFFECTING HIV TESTING IN GAY AND BISEXUAL MEN

Devon Price, MS, Stephanie Finneran, MA, Redd Driver, BA, Seth Kalichman, PhD

University of Connecticut, Storrs, CT

The CDC recommends men who have sex with men (MSM) get tested for HIV every three months after having unprotected anal sex (CDC, 2015). HIV testing is treated as the first step towards HIV prevention. However, there are significant social and psychological barriers to testing uptake. Even with improved HIV testing technology that can deliver accurate results in a matter of minutes, 1 in 8 people living with HIV are still unaware of their positive status (CDC, 2015). With the HIV testing gap still such a pressing issue, we sought to pin point which psychosocial factors might affect testing. This study examined a three psychosocial factor model of HIV testing decisions among men who have sex with men (MSM). Two of the psychosocial factors, HIV stigma and fatalistic beliefs regarding an HIV positive diagnosis, have been well documented in the literature on HIV testing and psychosocial barriers. However, the third psychosocial factor, the defensive process of avoiding relevant health information, has received less attention in relation to HIV testing. The present study investigated how these factors impact both past and contemporaneous HIV testing behaviors in MSM.

Surveys were collected from 400 gay and bisexual men at the 2015 Atlanta Pride Festival. Men answered questions about their HIV beliefs and attitudes, HIV testing history, sex behavior, and whether or not they would like to receive an at-home HIV test. A multivariate multinomial logistic regressions predicting testing history (never tested, tested but not recently, recently tested) revealed the only significant psychosocial predictor of group membership was HIV status related information avoidance. Those who reported greater HIV status related avoidance tendencies were more likely to have never been tested than those who were tested recently (in 2015), OR 0.62, 95% CI [0.50-0.76], or those who had been tested but not recently (not in the year 2015) OR 0.72, 95% CI [0.57-0.91]. A logistic regression analyses was conducted in order to assess predictors of contemporaneous HIV testing uptake. After controlling for covariates, HIV status related information avoidance was significantly related to testing uptake above and beyond the other psychosocial factors, OR 0.85, 95% CI [0.73-0.98]. Those who were higher in HIV status related information avoidance were less likely to accept the at-home HIV test.

Overall, our results indicate that an important potential mechanism has been missing from the study of psychosocial barriers to HIV-testing in the literature. HIV status related information avoidance predicts HIV-testing behavior above and beyond the psychosocial factors that have previously been considered the primary motivators for avoidance. Further examination of information avoidance and how it functions in relation to HIV testing decisions is warranted for furthering the understanding of why at-risk populations choose not to test for HIV.

SEX TRADE, VIOLENCE, HIV: MULTIPLE TRAUMAS IMPACTING UTILIZATION OF CARE

Lianne Urada, PhD[1], Laramie R. Smith, PhD[2], Jennifer Yore, MPH[3], Daniel P. Triplett, Sanne P. Moller, Sankari Ayyaluru, John Edmiston, Melissa Ramos, Pamela M. Schwartz, Alexadra X. Caraballo, Anita Raj, PhD[4]

[1]School of Social Work, San Diego State University and Center on Gender Equity and Health, Division of Global Public Health, UC San Diego, La Jolla, CA; [2]University of California San Diego School of Medicine, La Jolla, CA; [3]Center on Gender Equity and Health (GEH) at University of California, San Diego, La Jolla, CA; [4]University of California San Diego, La Jolla, CA

As part of Kaiser Permanente's Community-Based HIV Test & Treat Initiative, this study hypothesizes that sex trade involvement and experiencing recent physical or sexual violence are associated with lower levels of engagement in HIV care, HIV case management, and in other health services (substance use treatment, mental health services). **Methods:** Baseline survey data collected from October 2013-June 2016 as part of the multi-site Community-Based Linkage to and Retention in HIV Care study were used in the current analyses. Community recruitment of HIV-positive participants (N=581) was conducted by seven agency sites across six US cities. Multivariate multilevel logistic regression models were used to assess associations of sex trade and recent history of victimization from violence (physical and sexual violence) with outcomes of HIV care utilization in the past 6 months (defined as a medical appointment in which they received their CD4 count), HIV case management, mental health services, and substance abuse treatment. Models adjusted for age, race, gender, recent incarceration and substance use, being insured, running out of cash, and individuals nested within study sites. **Results:** Participants (N=582, median age 45 (IQR: 33-52) were majority heterosexual (53.6%), Gay/Lesbian (28.2%), and Bisexual (15.1%), although 14 (2.4%) did not specify their sexual orientation. Most identified as male (65.8%); 40.9% were cisgender females, and 10.7% were transgender females. Most participants were Black/African American (74.7%); 15.1% were Latino. 11.4% were involved in sex trade (past 90 days); 3.6% were physically abused (past year), and 2.8% were sexually abused (past year). 36.4% did not receive an HIV care appointment in the past 6 months, 63.9% missed a medical appointment in the past 3 months; 30.8% did not receive an HIV case management appointment in the past 3 months. 35.2% received mental health services in the past 12 months, and 18.4% participated in substance abuse treatment in this same timeframe. Adjusted analyses indicated no associations between recent sex trade involvement and receipt of HIV medical care, case management, or mental health services, though sex trade was associated with likelihood of having missed a healthcare appointment in the past 3 months (OR=2.58, CI:1.37-

4.88). Incarceration (OR=1.78, CI=1.16-2.83), being uninsured (OR=1.88, CI=1.08-2.35), and not having enough money was associated (OR=0.86, CI:0.74-0.99) with missing healthcare appointments. No associations were seen between recent physical or sexual violence and our outcomes of interest. However, being insured (OR=2.44, CI:1.51-3.95) was associated with HIV case management and mental health care (OR=1.71, CI: 1.01-2.87). **Conclusion**: HIV-positive participants involved in sex trade were more likely to have missed healthcare appointments and to utilize substance abuse treatment.

USING NEW MEASURES TO EXPLORE FACTORS ASSOCIATED WITH PREP INTENTIONS AND USE

Jennifer L. Walsh, PhD

Center for AIDS Intervention Research, Department of Psychiatry and Behavioral Medicine,
Medical College of Wisconsin, Milwaukee, WI

Background. Pre-exposure prophylaxis (PrEP) shows great promise to significantly impact the HIV epidemic; however, use among those most at risk, including men who have sex with men (MSM) and transgender (TG) individuals, remains relatively rare. Research is needed to determine appropriate targets for interventions to increase PrEP uptake. One basis for HIV prevention interventions is the Information-Motivation-Behavioral Skills (IMB) model. However, we do not yet know whether this model applies to PrEP intentions and use.

Methods. Participants completed a survey at a community event in a mid-sized city in the midwestern U.S. in 2016 (N=357, 64% White, 22% Black, 14% Latino, M_{age}=35). Only HIV- men (93%) and TG men and women (6%) who engaged in sex with men were included in this analysis. Items to assess PrEP knowledge, attitudes, stigma, descriptive and subjective norms, and intentions were developed and reviewed by experts in HIV prevention and HIV providers. Participants responded to the new measures and reported their current PrEP use. Structural equation modeling was used to test the IMB model, with separate models for intentions (for those not on PrEP) and use (for all participants). Models included demographic controls.

Results. All new measures performed well based on evaluations of items and correlations, confirmatory factor analysis, and tests for differential item functioning; all scales were reliable (αs=.83-.94). Only 12% of participants were taking PrEP, although 69% had heard of PrEP and 37% said they would probably/definitely start taking PrEP in the next 3 months.

A model with acceptable fit (χ^2(267)=417.37, RMSEA=.04, CFI=.95) explained 35% of the variance in PrEP use intentions. Stigma and descriptive norms predicted self-efficacy, B = -0.18, $p < .05$, and B = 0.26, $p < .05$, respectively. Attitudes, descriptive norms, and self-efficacy predicted intentions, B = 0.28, $p < .05$, B = 0.32, $p < .01$, and B = 0.17, $p < .05$, respectively. However, neither knowledge nor subjective norms was associated with intentions, and there was no mediation.

A second model with good fit (X^2(90)=308.57, RMSEA=.03, CFI=.96) explained 57% of the variance in use. Attitudes, stigma, and descriptive norms predicted self-efficacy, B = 0.28, $p < .05$, B = -0.20, $p = .001$, and B = 0.22, $p < .01$, respectively. Knowledge, stigma, and self-efficacy predicted use, B = 0.28, $p < .01$, B = -0.18, $p < .05$, and B = 0.29, $p = .001$, respectively. Attitudes, stigma, and descriptive norms had indirect effects on use via self-efficacy, in line with the IMB model. However, subjective norms were not associated directly or indirectly with use.

Conclusions. New PrEP-related measures were successfully piloted with a diverse sample of MSM. Results suggested that the IMB model may be useful when developing PrEP interventions, with knowledge, attitudes, stigma, descriptive norms, and self-efficacy all playing roles.

FACTORS CONTRIBUTING TO PRIMARY CARE VISITS AMONG HEMODIALYSIS PATIENTS IN A PATIENT-CENTERED MEDICAL HOME INTERVENTION

Ifeanyi Chukwudozie, MPH[1], Marian Fitzgibbon, PhD[2], Linda Schiffer, MS, MPH[3], Michael Berbaum, PhD[4], Cheryl Gilmartin, PharmD[3], Pyone David, MSW[3], Eson Ekpo, RN[3], Michael Fischer, MD, MHS[5], Anna Porter, MD[6], Alana Aziz-Bradley, MPH[3], Denise M. Hynes, MPH, PhD, RN[7]

[1]Cancer Center/University of Illinois, Chicago, IL; [2]Pediatrics/University of Illinois, Chicago, IL; [3]University of Illinois at Chicago, Chicago, IL; [4]Institute for Health Research and Policy, Chicago, IL; [5]Nephrology Division/Department of Medicine/University of Illinois, Chicago, IL; [6]Nephrology Division/Department of Medicine/University of Illinois at Chicago, Chicago, IL; [7]ACADEMIC INTERNAL MEDICINE/UNIVERSITY OF ILLINOIS & US DEPT OF VETERANS AFFAIRS, CHICAGO, IL

Background: Utilization of thepatient centered medical home (PCMH) model reduces hospitalizations, emergency room visits, and healthcare costs for some complex chronic diseases. Yet PCMH has not been examined for chronic kidney disease.

Purpose: In a non-randomized quasi-experimental 18-month intervention study, we implemented an adaptation of the patient centered medical home for kidney disease (PCMH-KD) at two urban dialysis centers. PCMH-KD integrated a primary care physician (PCP), nurse coordinator, pharmacist and community health worker (CHW) to the health care delivery team. In this analysis, we examined factors associated with PCP visits by adult chronic hemodialysis (CHD) patients.

Methods: We used logistic and Poisson regression analysis to examine factors contributing to having at least one visit with one of the study PCPs and the number of PCP visits. Patients were grouped based on their response to having a PCP or regular doctor and for how long during the baseline survey.

Results: Among 173 patients included in the analysis, 91 (53%) patients had at least one (≥1) visit with the PCMH-KD study PCP. Thirty-two of these patients 32 (35%) reported having a PCP at baseline which they have seen for six or more months (established PCP) while 59 (65%) reported no PCP or have a PCP for less than 6 months (no established PCP). Having more visits with the CHW was a significant predictor for having ≥1 visit(s) with one of the study PCPs in both the established PCP and no established PCP groups. CHD patients with no established PCP and had greater PCMH-KD PCP visits were females, self-reported Diabetes, used a medically arranged transportation to dialysis, had a stressful life events in the prior 6 months, and had a family member of friend involved with their dialysis care.

Conclusions: Both social and clinical factors influenced the use of the PCMH-KD PCP by CHD patients. This study is the first to examine factors affecting use of primary care by CHD patients. Understanding these relationships is important in care redesign aimed at improving outcomes for complex chronic diseases.

UTILIZATION OF PRIMARY CARE-MENTAL HEALTH INTEGRATION: A PERSPECTIVE FROM PRIMARY CARE PROVIDERS IN THE VA

Chelsea L. Rothschild, Ph.D.[1], Ashley Barroquillo, Psy.D.[2], Lucille Carriere, Ph.D.[3], Christine Davis-Hayes, LCSW [4], Stephanie Smith, LCSW [2], Nicole Webb, Ph.D. [2]

[1]VA Tennessee Valley Healthcare System, Nashville, TN; [2]VA Tennessee Valley Heathcare System, Murfreesboro, TN; [3]Tennessee Valley Healthcare System, Murfreesboro, TN; [4]VA Tennessee Valley Heathcare System, MURFREESBORO, TN

Co-located, collaborative care is one component of the Department of Veterans Affairs model of integrated care. Primary Care-Mental Health Integration (PC-MHI) is a multi-disciplinary program designed to address the mental health needs of Veterans in the primary care setting. The study aimed to assess primary care providers' perspective on two critical elements of integration: 1) Level of PC-MHI utilization and 2) potential referral barriers. Qualitative survey data was collected from Primary Care Clinicians (PCC) (N=22) from two VA medical centers to evaluate utilization rates and obtain information regarding current strengths and challenges of providing integrated primary care.

Results indicated the following utilization rates: 27.3% 2-3x/mo., 45.5% 1-2x/wk, 27.3% 3+/wk. PCC's indicated roughly similar preferences for face-to-face, same day referral (68.2%,)vs. requesting a future PC-MHI appointment (63.6%). PCC's most frequently request PC-MHI assistance to co-manage anxiety (100%), depression (95.5%), stress management (95.5%), and cognitive assessment (86.4%).

Regarding prescribing psychotropic medication to co-treat psychiatric conditions, it is notable that 4.5% were 'not comfortable' prescribing for depression/anxiety, while 22.7% were 'not comfortable' prescribing specifically for PTSD. PCC's noted minimal barriers to PC-MHI referral, with the most prevalent being patient refusal ('often a barrier' 36.4%). PCC's overall impressions of PC-MHI were favorable, reporting significant benefit to both themselves (M=9.36, SD= .90) and their Veterans (M=9.27, SD=1.07).

Preliminary findings provide insight into perspectives toward integrated care and suggest opportunities to further enhance care. Data indicates lower referral rates for behavioral health conditions such as chronic pain (45.5%), coping with medical illness (22.7%), and smoking cessation and weight management (4.5%), and suggests a target for increased PCC education. Findings also indicate an opportunity to decrease stigma associated with PTSD and increase PCC's comfort in initiating/managing psychiatric medications with PC-MHI support. Only 50% of PCC's reported awareness of availability of the depression medication monitoring protocol. Additionally, efforts must be made to decrease requests for future appointments, as same-day access is a central goal of the PC-MHI program. Focus on these areas is essential for ongoing improvement of the co-located, collaborative model of care.

CHANGES IN RESILIENCE PREDICT FUNCTION IN ADULTS WITH PHYSICAL DISABILITIES: A LONGITUDINAL STUDY

Karlyn A. Edwards, B.A.

University of New Mexico, Albuquerque, NM

Resilience has been identified as an important factor that may contribute to improved functioning and overall quality of life. Resilience, defined as the ability to restore or maintain psychological and physical health in the face of life stressors, may be especially important for those with physical disabilities, who often experience a multitude of stressors. Little is known about how resilience may relate to overall physical and psychological health of this population. Even further, if resilience is shown to positively relate to functioning, there is limited research examining whether resilience may be a viable target for treatment among this population. The current study sought to first examine the impact of resilience on four important measures of functioning (physical functioning, fatigue, sleep quality and depression) over the period of one year among those with physical disabilities. Second, the study compared how much resilience varied over one year in relation to other well-established and supported targets of treatment, such as fatigue, sleep quality, and depression. The study was comprised of 893 adults that had one of four physical disabilities - Muscular Dystrophy (18%), Multiple Sclerosis (40%), Spinal Cord Injury (18%), or Post-Polio Syndrome (24%). The participants were mostly White/Caucasian (90%), female (64%), and highly educated (81% receiving at least some college). The participants were assessed at two time points one year apart by mail-in survey. Four separate linear regressions examined if changes in resilience would predict one of four criterion variables (physical functioning, fatigue, sleep quality, and depression), while controlling for the baseline score of the criterion variable, age, sex, and diagnosis. Four Pearson *R* correlations were also done to examine the stability of resilience in comparison to depression, fatigue, and sleep quality. Our findings showed that changes in resilience were significantly associated with changes in physical functioning, fatigue, sleep quality, and depression over one year, with no differences among age, sex, or diagnosis group. Our findings also indicated that resilience did show similar test-retest stability over one year as depression, fatigue, and sleep quality. Our findings support that resilience is important in maintaining physical and psychological health among those with physical disabilities. Second, our findings provide support that resilience may be a viable target for treatment, such as depression, fatigue, and sleep quality are.

Learning Objective 1: Define resilience, and its relation to physical functioning, fatigue, sleep quality, and depression among those with physical disabilities.

Learning Objective 2: Discuss the variability and/or stability of resilience over time, as well as its viability as a target for treatment.

CORRELATES OF THE OCI-R SUB-SCALES AND MISOPHONIA

Shannon Cusack, N/A, Rachel Wallace, N/A, Therese Cash, M.S., Ph.D., Christina Sheerin, M.S., Ph.D., Scott Vrana, PhD, LCP

Virginia Commonwealth University, Richmond, VA

Correlates of the OCI-R sub-scales and misophonia

Misophonia is characterized by an aversion to specific sounds, usually made by other people. It has been proposed as potentially falling within the category of obsessive-compulsive spectrum disorders (OCSD). Evidence for a relation between misophonia and the OC spectrum is present in case reports of patients with misophonia endorsing co-morbid OCSDs, including obsessive-compulsive disorder. Data suggest that misophonia is associated with both obsessive rumination about the sound and compulsive behavior designed to stop the sound or mitigate its effects. Additional research is needed to better characterize this association and begin to explore potential mechanisms underlying misophonia. This study examines the association of misophonia with six subscales of the Obsessive Compulsive Inventory-Revised (OCI-R) and a brief misophonia screening question, "*Compared to other people, are you sensitive to certain sounds made by other people?* " in a cross-sectional survey of college students and community adults.

The current study (n=826, M_{age}=27.5, 63.6% female) investigates misophonia and its OCI-R sub-scale correlates. 16.2% of the total sample indicated they regularly experience misophonia, while 44.7% endorsed misophonia some of the time. Misophonia was significantly correlated with the full OCI-R (r = .22) as well as the obsessing subscale (r = .231) and the compulsive checking (r = .157), hoarding (r = .15), neutralizing (r = .15), ordering (r = .17), and washing (r = .20) subscales (all p Further analyses were conducted to explore the hypothesis that misophonia would be more strongly correlated with the obsessive vs. compulsive symptoms. The correlation between misophonia and the obsessing subscale was stronger than with the checking (z = 2.2, p = 0.03), hoarding (z = 2.3, p = 0.02), neutralizing (z = 2.4, p = 0.02), ordering (z = 1.8, p = 0.07), and washing (z = 1.5, p = 0.13) subscales. These results expand upon the literature regarding the OCD and misophonia relationship, suggesting that misophonia is more closely associated with obsessive rumination than compulsive behavior designed to reduce anxiety. Future research should extend these findings by further examining obsessive rumination as a potential mechanism of misophonia.

CRIME PREVENTION THROUGH SCHOOL RISK BEHAVIOR SURVEILLANCE OF ADOLESCENTS IN A HIGH CRIME RATE COMMUNITY

Imelda G. Alcala-Sánchez, Ph.D.[1], Carlos Gonzalo Ibáñez-Alcalá, M.Sc.[2], Miguel Conchas-Ramirez, M.A.[1], Manuel B. Gonzalez-Gonzalez, J.Dr.[1]

[1]Instituto Felipe Angeles/Universidad Autonoma de Chihuahua, Chihuahua, Chihuahua, Mexico; [2]Instituto Tecnologico de Monterrey, Chihuahua, Chihuahua, Mexico

The public health model is suitable for preventing risky behavior in adolescents living in high crime communities. Children and adolescent wellbeing and mental health can be compromised by high crime environments. Regular or recurrent participation in risky and antisocial behavior is an indication of lower self-control associated with criminal behavior in adolescent and youth. Assessment and early detection of individuals participating in risky and antisocial behaviors can lead to improve crime prevention efforts in communities with high crime rates. The Youth Risky Behavior Surveillance System (YRBSS), form the USA CCD, is an effective scholar system to monitor troubled behavior in adolescents. Risk behaviors are grouped in six categories of priority behaviors contributing to unintentional injury and violence, undesired pregnancy, sexually transmitted diseases including HIV-AIDS, tobacco, alcohol and illicit drug consumption, as well as inappropriate eating and sedentary life style. Mexican schools located in high crime communities may benefit from a monitoring system assessing high risk behaviors among middle school students. **Objetive.** To assess the psychometric properties of a Spanish version of the YRBSS in a sample of 581 middle school adolescents 11-14 years old, attending one of four middle schools located in high crime neighbors at the city of Chihuahua, Mexico. **Methods**: The 34 item transadapted Spanish version of the YRBSS questionnaire was completed anonymously in a 50 minute classroom session. Male and female students were recruited voluntarily to participate in the study after previously obtaining their parents authorization. School teachers collaborated with questionnaire delivery. **Results:** Overall Cronbach alpha was .746, with 81.1% of complete cases. In a principal component Exploratory Factor Analysis with a Varimax rotation and Kaiser normalization analysis two general factors were identified: a) Addiction and Sex, b) Violence and Leisure Time. Male students showed significantly higher frequencies of Risk Behaviors than females. Males endorsed significantly more alcohol consumption, sexual activity and violence items, than females. More females reported involvement in risky behavior related to affective reactions and monitoring their weight through exercise, diet and other means, than males. Despite some non-significant differences, gender trend described hold both with and without significant differences. **Conclusion:** YRBSS can be useful to monitor risky behaviors in

adolescent Mexican students differentiating males from females. Grouping of items into two sub-scales may reflect a link among behaviors, those relationships deserve further exploration as it may reflect a common dependence on psychosocial factors present in the studied sample.

EXAMINING THE POTENTIAL IMPORTANCE OF FREE WILL BELIEF FOR ANXIETY AND DEPRESSION

Courtney Alderson, BA, Hassan Khuram, NA, Ashlee Sawyer, MS

Virginia Commonwealth University, Richmond, VA

Previous findings from social cognitive research indicate that belief in free will is a factor of important *inter*personal consequence. However, a dearth of research exists regarding the *intra*personal effects of free will belief. The goal of this study was two-fold: 1) to increase the knowledge base concerning the *intra*personal effects of believing in free will; and 2) to investigate the potential importance of this psychological construct for mental health. By employing lay free will theory to the context of mental health, we hypothesized two very different routes by which the belief in free will would impact mental health—one route predicting a negative impact, and the other predicting a positive impact. As for the negative impact on mental health, we predicted free will belief would be positively associated with perceived stress and anxiety. Regarding the positive impact on mental health, we predicted that free will belief would be positively associated with coping self-efficacy and negatively associated with depression. A cross-sectional survey method was implemented to test the predicted associations. A sample consisting of 1048 undergraduate college students completed a survey containing several measures aimed at assessing individuals' self-reported mental health and belief in free will. Bivariate correlations partially supported our predictions. Per our predictions, free will belief was positively associated with perceived stress and coping self-efficacy ($r = .119$, $p = .01$; $r = .222$, $p = .01$, respectively). Contrary to our predictions, no associations for free will belief were found for anxiety or depression ($r = -.017$, $p > .05$; $r = -.043$, $p > .05$, respectively). However, a series of mediation analyses using a bootstrapping technique provided more nuanced support for our predictions. While free will belief was found to negatively impact (i.e., increase) both anxiety and depression by way of perceived stress, it was also found to positively impact (i.e., decrease) anxiety and depression by way of coping self-efficacy. These results provide preliminary evidence that suggests free will beliefs have important *intra*personal implications for mental health/psychological wellbeing. While basic research is needed to more accurately understand these associations, future applied work should identify ways that free will beliefs could be targeted so as to increase self-efficacy with healthy coping strategies, as well as reframe the free will—perceived stress linkage.

FINANCIAL WELL-BEING AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS

Tucker-Seeley D. Reginald, MA, ScM, ScD[1], Gillian L. Marshall, MSW, PhD[2]

[1]Harvard T.H. Chan School of Public Health/ Dana-Farber Cancer Institute, Boston, MA;
[2]University of Washington, Tacoma, WA

Financial well-being (FWB) has recently been conceptualized in cancer survivorship research across three domains: material, psychosocial, and behavioral. The material domain refers to the lack of financial resources (e.g. material hardship), the psychosocial domain refers to how one feels about the lack of resources (e.g. financial worry), and the behavioral domain captures what one does with their financial resources (e.g. saving/consumption behaviors). Research has consistently shown an association between FWB concepts such as financial hardship and health across a range of specific population groups such as low-income housing residents, cancer survivors, and smokers. However, the association between multiple domains of FWB and depressive symptoms among older adults has yet to be explored. Thus, it remains unclear whether the various domains of FWB are differentially associated with mental health among older adults. The purpose of this study was to determine the association between the material, psychosocial, and behavioral domains of financial well-being and depressive symptoms. Cross sectional analysis was conducted using data from the 2010 Health and Retirement Study Leave Behind Questionnaire (N=7,407). Multiple items within each FWB domain were summed to create material, psychosocial, and behavioral FWB scores, with increasing scores indicating worse FWB. Depressive symptoms were operationalized using the Center for Epidemiologic Studies Depression (CESD) scale (range 0-8), with a cut-off CESD score greater than four indicating depression. Multivariable logistic regression was used to obtain the odds of depression (reporting more than four depressive symptoms). Our results showed that increasing scores on each of the FWB domains (worse FWB) was positively associated depression, even after controlling for demographic (age, race, ethnicity, marital status) and socioeconomic (education, household income) characteristics: material (Odd ratio(OR)=1.41; 95% Confidence Interval (CI): 1.35, 1.47), psychosocial (OR=1.17, 95% CI: 1.15, 1.20), and behavioral (OR = 2.09; 95% CI: 1.80, 2.41). Though these results show a similar pattern of worse FWB positively associated with depression for each domain, their differential association is important for the further explication of the pathway between socioeconomic circumstances and mental health among older adults, over and above traditional measures of socioeconomic status such as education and income. In addition, such explication provides greater specificity for potential intervention targets where programs can be designed for improving the material, psychosocial, and/or behavioral

domains of FWB to reduce depressive symptoms and overall mental health among older adults..

FREQUENCY AND PREDICTORS OF DISTRESS IN A DIVERSE CANCER SAMPLE

Laura M. Perry, BS[1], Ashley Beggin, N/A[2], Michael Hoerger, PhD, MSCR[2]

[1]Tulane University, New Orlenas, LA; [2]Tulane University, New Orleans, LA

Title: Frequency and Predictors of Distress in a Diverse Cancer Sample

Objective: Determining the prevalence of distress and its predictors among patients with cancer is important in developing and implementing tailored interventions to help reduce these symptoms. Recent studies addressing these issues have reported results from samples that are majority female and white. The purpose of this study was to examine the frequency and demographic and health predictors of distress in an ethnically diverse sample of patients with multiple cancer diagnoses.

Method: A sample of 1,616 individuals with a cancer diagnosis who visited a cancer center in 2015 responded to items on distress, demographics, and health history. Distress was evaluated using the Distress Thermometer. Logistic regression (odds ratios) was used to determine the demographic and health variables associated with clinically significant distress (Distress Thermometer score ≥ 4).

Results: Participants were relatively equally distributed across gender (female = 47%; male = 53%), and the majority of participants were either White (49%) or African American (47%). They had a range of cancer diagnoses, with the most frequent being prostate cancer (27%), hematological cancer (25%), and breast cancer (24%). Clinically significant distress was present in 19.5% of the sample. The variables associated with increased risk for distress included female gender (OR = 1.56, p = .027), younger age (< 65 years old; OR = 2.38, p < .001), having lung/bronchus cancer (OR = 1.94, p = .049) or head/neck cancer (OR = 2.36, p = .023), presence of metastases (OR = 1.81, p = .003), and presence of symptom burden (OR = 1.75, p < .001).

Conclusion: The prevalence of distress in this sample was 19.5%. Significant predictors of distress included certain demographic (gender and age) , diagnostic (lung/bronchus and head/neck cancer), and health (metastases and symptom burden) variables. This study helps to generalize findings on the prevalence and predictors of distress in cancer to a more diverse population of patients with cancer.

INTERPERSONAL VIOLENCE HISTORY AND CHILDBIRTH-SPECIFIC POSTTRAUMATIC STRESS SYMPTOMS

Meghan Sharp, M.A., Melissa Decker, M.A., Heather Littleton, Ph.D., Christyn Dolbier, Ph.D.

East Carolina University, Greenville, NC

__Introduction__: Childbirth can be a traumatic event for some women due to risks of death or serious injury to the baby and/or mother during birth. Prior research has supported that a history of childhood sexual abuse (CSA; sexual contact by a relative or authority figure before age 14) is associated with elevated risk of childbirth-related PTSD symptoms. CSA survivors may be at greater risk to experience trauma symptoms due in part to deficits in emotion regulation and adaptive coping, as well as pre-existing elevations in psychological distress, potentially including PTSD. However, prior work has not examined the extent to which childbirth-specific PTSD relates to other experiences of interpersonal violence including adult sexual assault (ASA), childhood physical abuse (CPA), and adult physical intimate partner violence (IPV). The current study evaluated CSA, CPA, ASA, and IPV as predictors of childbirth-specific PTSD symptomology in the postpartum period.

__Method:__ Participants were 159 women who gave birth to a living child in the past four months recruited via social media for an online survey of pregnancy and childbirth experiences (M=29 years; majority White, married, college-educated, primaparous). A total of 30.8% reported prior sexual or physical abuse or assault.

__Results:__ CPA survivors reported higher PTSD arousal symptoms ($n = 15$; $M = 10.6$) than both IPV survivors ($n = 35$; $M = 5.55$) and women with no PA history ($n = 39$; $M = 5.3$), $F\,(3,91) = 3.14$, $p = .03$, $\eta^2 = .10$. SA survivors exhibited no differences in PTSD symptomology according to timing of abuse or compared with women with no SA history.

__Conclusions__: Results highlight potential differences in postpartum trauma symptomology with timing and type of interpersonal trauma. Unexpectedly, CSA survivors did not report greater severity of PTSD, and CPA survivors reported greater symptoms of arousal only. The high SES of the sample may have affected results, as women of low SES may be more likely to experience elevated distress, more life stressors prior to birth, as well as more traumatic events during birth. Future research should examine effects of trauma duration and severity, as well as the cumulative effects of multiple traumas on risk for childbirth-related PTSD in larger samples of mothers. Finally, as trajectories of PTSD symptomology differ, future study should examine differences in PTSD symptoms over time.

SEDENTARY BEHAVIOR AND POST-TRAUMATIC STRESS DISORDER SYMPTOMS IN ACUTE CORONARY SYNDROME SURVIVORS

Deanna Zhu, B.A.[1], Ian Kronish, MD, MPH[2], Donald Edmondson, PhD, MPH[3], Joseph Schwartz, PhD[1], Keith M. Diaz, PhD[1]

[1]Center for Behavioral Cardiovascular Health, Columbia University Medical Center, New York, NY; [2]Columbia University Medical Center, Center for Behavioral Cardiovascular Health, New York, NY; [3]Columbia University Medical Center, New York, NY

Introduction: Many survivors of acute coronary syndrome (ACS) develop post-traumatic stress disorder (PTSD). Patients with ACS-induced PTSD have twice the risk of recurrent cardiac events; however the contributing mechanisms have not been elucidated. The purpose of this study was to examine the patterns of sedentary behavior (an emerging and potent cardiovascular risk factor) among ACS survivors with and without PTSD symptoms in the one month following hospital discharge.

Methods: Hospitalized patients with confirmed ACS (n=50, 24% female, mean age: 62 ± 10 years) were invited to wear an Actical accelerometer on their non-dominant wrist for 30-days post discharge, after which they completed the PTSD CheckList (PCL) tailored to those who incurred a cardiac-related event. Patients were classified as those reporting (54%) and not reporting (46%) any PTSD symptoms. Total sedentary time was quantified as the number of min/day spent sedentary for each week (e.g. weeks 1-4) post-hospitalization.

Results: In multivariable adjusted analyses, there was a significant main effect of PTSD symptoms on levels of sedentary time in weeks 1-4 post-hospitalization (F=4.2, p=0.046). Total sedentary time was significantly higher among patients reporting PTSD symptoms compared to those without PTSD symptoms in week 1 post-hospitalization (PTSD symptoms: 824 ± 37 vs. No PTSD symptoms: 700 ± 40 min/day; p=0.028). A trend for higher sedentary time in patients with PTSD symptoms was also observed in week 2 (PTSD symptoms: 787 ± 42 vs. No PTSD symptoms: 675 ± 45 min/day; p=0.078), week 3 (PTSD symptoms: 766 ± 42 vs. No PTSD symptoms: 657 ± 45 min/day; p=0.088) and week 4 (PTSD symptoms: 741 ± 42 vs. No PTSD symptoms: 630 ± 45 min/day; p=0.082) post-hospitalization.

Conclusion: ACS survivors reporting cardiac-related PTSD symptoms had greater sedentary time in the four weeks following hospitalization than those not reporting any PTSD symptoms.

Future research should consider examining the role of sedentary behavior as a risk factor for recurrent cardiac events in ACS survivors who develop PTSD symptoms.

THE DEVELOPMENT AND INITIAL EVALUATION OF A CALL CENTER FOR CONCERNED FAMILY MEMBERS OF MILITARY VETERANS

Jennifer M. Picanso, B.A., MSW candidate

Department of Veterans Affairs, Los Angeles, CA

The Development and Initial Evaluation of a Call Center for Concerned Family Members of Military Veterans

Military Veterans with mental health issues can often struggle in recognizing that they need care or are silenced by the stigma associated with reaching out for help. Family and friends are the first to identify that care is needed but feel powerless in convincing the Veteran to seek mental health care. *Coaching Into Care* is a program developed by the Department of Veterans Affairs to educate and provide support to people surrounding the Veteran to promote help-seeking behavior. Since the program's inception in 2011, call volume has risen to over 3000 incoming yearly calls. The most frequent caller was a female spouse or parent of a Veteran calling about a male Veteran, and about 50% of those Veterans had deployed to Iraq or Afghanistan. The majority of problems identified in our 9 month examination cohort (79.9%) concerned a psychosocial issue, such as psychiatric/behavioral problem, medical problems, and questions about VA services. Fifty-eight percent of calls were referred by first-line call responders to a professional coach for targeted intervention. Those receiving the extended telephone-based coaching service were provided approximately 17 calls over 6 months. Among those callers in our examination cohort receiving coaching (N = 165), about 31% of Veteran were engaged in some type of mental health care; 6 months of coaching calls was associated with an almost 50% increase in Veterans' receiving mental health treatment (up to 48%), which was statistically significant. Overall, 76.2% of the callers reported obtaining the service they "hoped for," 76.9% were "more hopeful," and 85.2% felt "more prepared to the help the Veteran." *Coaching Into Care* provides a unique clinical service to families and friends of Veterans who: 1) have not yet engaged in care; 2) who need additional mental health services; or 3) are minimally, or sporadically, engaged in mental health treatment.

TRAUMA CORRELATES OF DECREASED SOUND TOLERANCE CONDITIONS

Rachel Wallace, B.S. Psychology[1], Shaina Gulin, B.S. Psychology; M.S. Clinical Psychology[2], Therese Cash, M.S., Ph.D.[2], Christina Sheerin, M.S., Ph.D.[2], Danielle Dick, Ph. D.[3], Kenneth Kendler, M.D.[4], Scott Vrana, Ph. D.[5]

[1]Clinical Psychology/Department of Psychology/Virginia Commonwealth University, Richmond, VA; [2]Virginia Commonwealth University, Richmond, VA; [3]Devlopmental and Clinical Psychology; Virginia Commonwealth University, Richmond, VA; [4]Virginia Institute for Psychiatric and Behavioral Genetics, Richmond, VA; [5]Virginia Commonwealth University Departments of Psychology and Psychiatry, Richmond, VA

Decreased sound tolerance (DST) conditions are emerging clinical conditions in behavioral medicine. Misophonia is an extreme negative emotional response to specific sounds (e.g., people chewing, swallowing). Hyperacusis involves high sensitivity to sounds below normal sound sensitivity thresholds. Both often co-occur with tinnitus (the perception of ringing or buzzing in the ears). Although research on DSTs has found that they are related to anxiety sensitivity and obsessive-compulsive traits, little is known about their associations with traumatic life events and posttraumatic stress symptoms (PTSS). This study examines the association of DSTs with past year traumatic events in a longitudinal health and genetics survey study of undergraduates. The present work (n=975, Mage=20.9, 68.6% female) examines DST conditions and their trauma correlates. 21.6% of students endorsed tinnitus, 31.4% endorsed misophonia, and 6.9% endorsed hyperacusis. Rates of endorsement for trauma experiences were as follows: 6.4%, natural disaster; 13.4%, transportation accident; 6.4%, physical assault; 3.0%, sexual assault; 13.5%, another unwanted/uncomfortable sexual experience. Chi-square analyses demonstrated that tinnitus was associated with physical assault [$\chi2(1)=7.0$, $p < .01$], natural disaster [$\chi2(1)=4.9$, $p < .05$], transportation accident [$\chi2(1)=4.5$, $p < .05$], and other unwanted/uncomfortable sexual experience [$\chi2(1)=5.9$, $p < .05$]. Hyperacusis was related to other unwanted or uncomfortable sexual experience [$\chi2(1)=9.6$, $p < .01$], while misophonia was not related to any traumatic events. Of those who experienced a traumatic event in the past year, 41.0% (n=114) reported experiencing posttrauma-related symptoms. Chi-square analyses revealed a significant relationship between PTSS and hyperacusis [$\chi2(1)=5.0$, $p < .05$], but not with tinnitus or misophonia. In this large, normative university student sample, DSTs and traumatic life events were prevalent. Tinnitus and hyperacusis were associated with past traumatic experiences, whereas misophonia was not. Trauma-related symptoms were prevalent and associated with

hyperacusis. Future research should extend these findings on trauma and DST conditions by studying PTSS symptoms more comprehensively and examining the mechanisms by which PTSS correlates with hyperacusis.

ASSESSING FOR REACTIVITY TO AN ECOLOGICAL MOMENTARY ASSESSMENT PROTOCOL USING DATA FROM INDIVIDUALS RECOVERING FROM ADDICTION

Nisha C. Gottfredson, PhD

UNC Gillings School of Global Public Health, Chapel Hill, NC

Ecological momentary assessment (EMA) methodology permits inference about within-person processes in real life setting. Compared with cross-sectional designs, EMA enables more objective measurement of temporal associations between variables without relying on participants to introspect or recall this information. Nevertheless, repeated assessment may introduce a new challenge: participant reactivity.

EMA designs may draw a participant's attention to a nonconscious process, resulting in behavior change. Alternatively, participants might fall in to a habitual pattern of responding after several assessments. Using an example of negative affect and substance use, *introspective behavior change* might result in lower rates of substance use or a weaker association between negative affect and substance use over time. *Habitual responding* might result in reduced within-person variation over time, which would thereby reduce the magnitude of predictor-outcome associations.

Previous research on participant reactivity to EMA methods has explored whether mean levels of the outcome changed during the study; most of this research has found little evidence of reactivity (Collins et al, 1998; Farchaus et al, 2003; Hoffman, 2007; Hufford et al, 2002; Nishina, 2012; Stone et al, 2002). No previous study considered changes in predictor prevalence, changes in variation of responding, or bivariate changes in predictor-outcome associations. Failure to recognize and account for participant reactivity may result in biased inference. On the other hand, identifying protocols that lead to participant reactivity has the potential provide valuable information about mechanisms for behavior change.

I outline how to assess for different types of participant reactivity and I discuss options for modeling data in the presence of reactivity through a combination of data visualization, semi-parametric modeling (Time-Varying Effect Model, Li et al, 2015), and parametric modeling. N = 126 individuals receiving treatment for addiction received four EMA surveys per day for 7 days in two bursts spaced 6 weeks apart. Surveys assessed participant negative affect (NA) and substance use (SU). By using a measurement burst design, I can parse true change over time from artefactual change resulting from the EMA design. Variation in NA decreases over the 7 days in a burst and the bivariate association peaks mid-week. Looking at stable change across

bursts, SU increases but the bivariate association between NA and SU does not change.

In addition to presenting methods for assessment, I suggest methods for limiting reactivity in EMA protocol design.

DO INJUNCTIVE AND DESCRIPTIVE NORMATIVE BELIEFS NEED AN OUTCOME EVALUATION IN VALUE EXPECTANCY MODELS?

Paul Branscum, PhD, RD, Maria Collado-Rivera, MS, CHES

The University of Oklahoma, Norman, OK

Value-expectancy models are common place in health behavior research and practice, and posit that behaviors are determined by antecedents (ex. attitudes), which are formed by an individual's belief that a behavior is likely to lead to certain outcomes (expectancy), and the value one places each outcome (value). A popular value-expectancy model in social and behavioral health is the Theory of Planned Behavior. One construct of this model, perceived norms, consists of two types of normative pressure: injunctive norms (the perception that significant referents want you to behave in a certain way) and descriptive norms (the perception that a behavior is normal for others like yourself). Each construct follows the value-expectancy approach for measurement. Injunctive norms are formed by a combination of injunctive normative beliefs and motivation to comply, and descriptive norms are formed by a combination of descriptive normative beliefs and identification with each referent. Some evidence has shown that measuring the value construct (motivation to comply) in conjunction with injunctive normative beliefs does little for improving the utility of the TPB, and some have called for its removal. Concurrently, no study has investigated whether measuring the value construct (identification with referents) in conjunction with descriptive normative beliefs improves the utility of the TPB. Therefore, the purpose of this study was to evaluate the value-added of measuring injunctive and descriptive norms using a value-expectancy model, compared to an expectancy only based model. Overweight and obese adults (n=410) at a weight-loss clinic in a southwestern city completed an TPB survey related to consuming no sugary beverages in the following 6-months. Direct and indirect measures of injunctive and descriptive norms were evaluated. Each expectancy-value pair (model 1) and expectancy-only measure (model 2) was correlated with the composite direct measures of either construct. Results showed little difference between methods. In model 1, all expectancy-value pairs were significant ($p < 0.001$) for injunctive norms [spouse ($r=0.50$), friends ($r=0.45$), children ($r=0.45$), and parents ($r=0.49$)], but only spouse ($r=0.17$; $p < 0.01$), was significantly associated with descriptive norms. In model 2, the associations were slightly improved, but mostly unchanged. For injunctive norms all correlations were significant ($p < 0.001$) [spouse ($r=0.50$), friends ($r=0.48$), children ($r=0.50$), and parents ($r=0.53$)], and for descriptive norms only spouse ($r=0.21$; $p < 0.001$), was significantly associated. Results suggest that there was little to no value added to having the 'value' based measure in this value-expectancy model.

Future researchers should consider dropping these measures to reduce respondent burden, or find alternative ways of measuring these constructs.

IMPROVING DATA QUALITY OF HEALTH SURVEYS THROUGH WEB-BASED EXPERIMENTS

Stephanie Fowler, PhD, MPH, Gordon Willis, PhD, Richard Moser, PhD, Rebecca Ferrer, PhD, David Berrigan, PhD, MPH

National Cancer Institute, Bethesda, MD

Health surveys are vital for surveillance of health behaviors. Importantly, the quality of data obtained from these surveys is crucial for drawing accurate conclusions about population health and informing interventions. Survey experiments and repeated measures designs allow researchers to assess validity and reliability. However, health surveys are seldom tested comprehensively because it is costly and time-consuming. Given that large cohort studies and surveillance efforts often rely on survey data, more efficient approaches to testing are needed. The present investigation examined the utility and efficiency of using an online, crowd-sourcing platform as a means for conducting validity and reliability testing of health surveys. We used Amazon.com's Mechanical Turk, an online labor market, as our testing platform. The study incorporated both a between-subjects manipulation of question order to assess order effects, and a within-subjects repeated measure of the survey to assess test-retest reliability. At Time 1, respondents were randomly assigned to one of two experimental conditions in which the order of questions on walking behavior, and perceptions of the walking environment, was varied. Note these questions were used in the 2015 National Health Interview Survey. At Time 2, four weeks later, respondents were invited to complete the survey again in the same order to assess test-retest reliability. The 1,446 respondents at Time 1 represented a wide range of demographic characteristics that roughly matched those of the U.S. adult population: 56.2% male, 84% Non-White Hispanic, 50% with a Bachelor's degree minimum, M_{age} = 31.8, SD_{age} = 10.6. The 960 respondents who participated again at Time 2 allowed us to assess item test-retest reliability for the newly developed questions pertaining to perceptions of the walking environment. These questions demonstrated moderate to high test-retest reliability overall (Kappa = .48-.84). Further, consistent with previous findings on question ordering and walking behaviors, we obtained a significant order effect such that respondents first answering questions on perceptions of the walking environment had lower odds of transportation walking than did respondents first asked about walking behavior: OR = 0.61 (95% CI 0.46-0.75), p = .02. Given that physical activity questions, like walking, are often embedded among a larger set of health behavior questions, an efficient and cost-effective platform for conducting survey experiments can help increase the confidence in findings obtained from health surveys. Success of this rapid (~5 week), low-cost experiment ($800), and feasiability of conducting repeated measures, supports further use of

online platforms as vehicles for the conduct of survey experiments and reliability testing to improve the quality of data obtained from health surveys.

PSYCHOMETRIC EVALUATION OF THE RELAPSE SITUATION EFFICACY QUESTIONNAIRE AMONG ADULTS SEEKING WEIGHT LOSS TREATMENT

Yang Yu, MSN, Jeffrey Rohay, PhD, MSIS, Susan Sereika, PhD, Ran Sun, MSN, Jacob Kariuki, PhD, Lora Burke, PhD, MPH

University of Pittsburgh, Pittsburgh, PA

Background: Abstinence self-efficacy (ASE) has been identified as a key construct in relapse prevention of addictive behaviors; however, no scale existed for relapse following intentional weight loss. We adapted an existing scale measuring ASE among smokers and used the Relapse Situation Efficacy Questionnaire (RSEQ) to measure individuals' confidence in staying on their weight maintenance plan. **Objective:** The psychometric properties of the RSEQ were assessed, including internal consistency reliability, convergent validity, predictive validity and construct validity. **Methods:** In a 12-mo weight loss maintenance study, the RSEQ was administered at 0, 6 and 12 mos. Convergent validity was assessed at baseline by using Spearman's correlation between RSEQ and Weight Efficacy Lifestyle questionnaire; predictive validity was examined by the Spearman's correlation between 6-mo RSEQ and 12-mo measures of adherence to physical activity goal, adherence to calorie/fat goal and body weight; construct validity was assessed via using principal component analysis (PCA) with Promax rotation. **Results:** The sample (n=148) was mostly female (90.5%) and white (81.1%) with a mean body mass index of 34.1 + 4.6 kg/m^2. The RSEQ showed good internal consistency (Cronbach's α = .81 to .95) and convergent validity (r=.71). The 6-mo RSEQ was positively associated with 12-mo adherence to calorie goal (r=.23) and 12-mo adherence to fat goal (r=.22); 6-mo RSEQ was negatively associated with 12-mo body weight (r= -.25). PCA suggested that the 31 items can be factored into 6 components: *negative emotion* (8 items), *positive emotion* (6 items), *social-food occasions* (5 items), *distracting situations* (5 items), *work-leisure activities* (5 items) and *physical negative situation* (2 items), accounting for 67.5% of the total item variance. All items had loaded primarily on one factors, with factor loadings >.40, and all factors were moderately to highly positively correlated (r= .25 to .58). **Conclusion:** This study provides preliminary support for the reliability and validity of the RSEQ. Future work needs to add more items to the factor *physical negative situation* and to examine RSEQ in other studies with larger and more diverse samples.

RRR-DERIVED INDEX OF DIETARY BEHAVIORS IS STRONGER CORRELATE OF REPEATED MEASURES OF OBESITY

Wendy E. Barrington, PhD, MPH, Shirley A.A. Beresford, PhD

University of Washington, Seattle, WA

Background: Identification of reliable dietary measures of obesity-risk is needed to facilitate evaluation of prevention efforts. Given that key research supporting specific dietary recommendations has recently come into question, continued use of data-driven analytic techniques in nutritional epidemiology is warranted. Traditional derivation of dietary indices has involved factor analysis of nutrients to maximize exposure variance. Yet, dietary behaviors like intake of fast food, fruits and vegetables, and soft-drinks have each been associated with obesity and may be more easily and reliably measured than nutrient intake in larger studies. Using statistical methods that maximize the variance in obesity as a response may also produce a more salient dietary factor. The purpose of our study was to identify a dietary behavior index most related to obesity.

Methods: The Promoting Activity and Changes in Eating (PACE) study is a group-randomized weight gain prevention trial among 34 worksites in the Seattle Metro Area. Behavioral data and body mass index (BMI) were collected among all participating employees at baseline (2005-2007) and follow-up (2007-2009) while measured waist circumference (WC) was collected on a random subsample (n=622 at baseline). Factor, partial least squares, and reduced rank regression (RRR) analyses were conducted among a random test half of these individuals without missing data at baseline. Confirmatory analyses were performed within the validation half at baseline and among all those with follow-up data. Multilevel linear models included adjustment for covariates and clustering within worksites.

Results: Fast food, fried potato, and soft-drink intake were the most obesogenic behaviors using RRR analyses with BMI and WC as response variables. Each quartile increase in dietary index score was associated with a 5% higher geometric mean BMI (Ratio= 1.053; 95% CI: 1.031, 1.075) and approximate 4% higher geometric mean WC (1.036; 95% CI: 1.019, 1.054) at baseline adjusted for covariates. Results were similar at follow-up and remained statistically significant for WC after baseline adjustment.

Conclusions: Our findings, although small in magnitude, may still have significant public health implications given associations were demonstrated among all men and women in the study for relatively low frequencies of reported dietary behaviors. These findings may have

application for identifying those at risk of central obesity in clinical and community settings and may inform intervention strategies.

STRUCTURAL VALIDITY AND MEASUREMENT INVARIANCE OF A SPANISH LANGUAGE TRANSLATION OF THE PEARLIN MASTERY SCALE

Janna Gordon, M.S. [1], Vanessa L. Malcarne, Ph.D.[2], Scott Roesch, Ph.D[2], Richard Roetzheim, MD[3], Kristen Wells, Ph.D., MPH[2]

[1]SDSU/UC San Diego Joint Doctoral Program in Clinical Psychology, San Diego, CA; [2]San Diego State University, San Diego, CA; [3]U. of South Florida, Tampa, FL

The Pearlin Mastery Scale is a seven-item scale frequently used in psychological research to assess individuals' personal mastery, or the extent to which they believe they are in control of their own life and fate. Since its development in the 1970s, the Mastery Scale has been utilized in diverse samples, including caregivers, psychiatric populations, and individuals with chronic illnesses. It has also been adapted from English into multiple languages, including Spanish. However, to date, no published studies have examined the psychometric properties of Spanish translations of the Mastery Scale. This analysis evaluated the structural validity and measurement invariance of a Spanish translation of the Mastery Scale in two samples of Spanish-speaking individuals receiving healthcare at community clinics in Florida. Sample 1 (N = 63) was comprised of adults enrolled in a study investigating the relationships among stress, depression, and glycemic control in low-income patients with type 2 diabetes. Participants in Sample 2 (N = 82) were recruited as part of the Patient Navigation Research Program and had received an abnormal screening test for breast or colorectal cancer. Confirmatory factor analysis (CFA) and multiple group CFA were conducted both on the full seven-item scale as well as a five-item version commonly utilized in the literature. CFA indicated that the seven-item and five-item scales yielded two-factor and one-factor solutions, respectively, for the combined sample of Spanish-speaking patients. However, although the specified factor solutions fit each individual sample separately, multiple group CFA revealed that the Mastery Scale items did not load equivalently on the specified factors across samples. This suggests that the Spanish version of the Mastery Scale may not measure mastery consistently across groups and that researchers should use this version with caution, especially with Spanish-speaking participants from diverse cultural backgrounds.

THE CROSSOVER EFFECT OF PREDICTING INTENTIONS WITH THEORETICAL ANTECEDENTS OF VEGETABLE SUBGROUP CONSUMPTION

Paul Branscum, PhD, RD[1], Valerie Senkowski, MS in Health Promotion[2]

[1]The University of Oklahoma, Norman, OK; [2]University of Oklahoma, Norman, OK

Oftentimes health behaviors are in fact ‘behavioral categories’ that comprise of a number of interrelated behaviors that meet a common recommendation. For example, while the USDA has a daily recommendation for vegetable consumption (2.5-3.0 cups), this recommendation can be met by consuming a variety of vegetables, which in turn, can be viewed as independent behaviors. Another set of recommendations the USDA published is that individuals should vary their intake of vegetables by consuming from five subgroups each week (beans and peas, starchy, orange and red, green, and other). An advantage to studying sub-behaviors of a behavioral category, it that the results can provide targeted information, that can help shape future theory-based interventions. When sub-behaviors are studied together, a cross-over effect can also be evaluated, through which one sub-behavior (ex. starchy vegetables) can be examined by theory-based antecedents of the other interrelated behaviors (i.e. attitudes towards eating beans and peas). The purpose of this study was to examine the crossover effect for predicting each vegetable subgroup, with theoretical antecedents from all vegetable subgroup categories. The Integrative Model of Behavioral Prediction provided the theoretical underpinnings of this study. Undergraduate students (n=386) completed an online survey evaluating each vegetable subgroup, and its theoretical antecedents (attitudes, perceived norms, and perceived behavioral control (PBC)). Two stepwise multiple linear regression models were run for each vegetable subgroup. The first (base) model used its own behavioral antecedents to predict intentions. The second (omnibus) model included behavioral antecedents from all vegetable subgroups to predict intentions. Results from the first set of models indicated that attitudes, perceived norms and PBC predicted a significant amount of variance of intentions (40.5% to 54.6%) for each vegetable subgroup. Results from the second set of models showed that adding antecedents from the interrelated behaviors improved the amount of variance explained for intentions (41.7% to 56.1%) for each vegetable subgroup, but the improvements were minimal (added 5.8% to 1.2% to each model). Overall, the IM was found to be a useful framework for predicting the intentions of vegetable subgroup consumption. When testing the crossover effect of behavioral antecedents, while all models improved to some extent, improvements were minimal, and may not carry much statistical relevance.

A GENDER- AND CULTURALLY-SENSITIVE WEIGHT LOSS INTERVENTION FOR HISPANIC MALES

David O. Garcia, PhD[1], Luis Valdez, MPH[2], Benjamin Aceves, II, MPH, MA [3], David Campas, B.S. Public Health [4], Julio Loya, BSN, RN, CMSRN[5], Melanie D. Hingle, PhD, MPH, RD[3], Melanie L. Bell, PhD[3], Steven P. Hooker, Ph.D.[6], Marylyn M. McEwen, PhD, RN, FAAN[3]

[1]University of Arizona, Mel and Enid Zuckerman College of Public Health, Tucson, AZ; [2]Mel and Enid Zuckerman College of Public Health: University of Arizona, Tucson, AZ; [3]University of Arizona, Tucson, AZ; [4]University of Arizona Health Promotion Research Assistant, Tucson, AZ; [5]University of Missouri - Columbia, Marana, AZ; [6]Arizona State University, Phoenix, AZ

Background: Hispanic males have the highest rates of overweight and obesity when compared to males of other racial/ethnic groups. While weight loss can significantly reduce obesity related health risks, Hispanic males are significantly underrepresented in weight loss research. Our work addresses a critical gap by informing how tailored intervention strategies improve weight management in this health disparate population. **Purpose:** This study compares a 12 week gender- and culturally-sensitive weight loss intervention (GCSWL) to a waist-list control (WLC) in sedentary, overweight/obese Hispanic males. **Methods:** Fifty Hispanic males (age: 42.1 ± 12.7 years; BMI: 34.1 ± 5.3 kg/m^2; 48% Spanish speaking only) were randomized to one of two groups: GCSWL (n=25) or WLC (n=25). GCSWL participants attended weekly in-person individual sessions guided by a trained bilingual Hispanic male lifestyle coach, were prescribed a daily reduced calorie goal with a specific focus on reducing/modifying the types of food and liquids consumed (e.g., alcohol/sugar sweetened beverages), and 225 minutes of moderate-intensity physical activity (PA) per week. Additional GCSWL features included a free gym membership and optional spouse/significant other attendance at intervention sessions. The WLC were asked to maintain their usual dietary intake and PA habits during the 12 weeks. Results below represent preliminary data for participants who have reached their 6-week assessment time point to date (n=31). **Results:** At week 6, attendance at individual GCSWL sessions is approximately 80%. The overall attrition rate is 9.7%, with 28 of 31 participants completing 6-week assessments (GCSWL: n=1, 6.3% vs. WLC: n=2, 13.3%). The observed pre-post mean weight loss for the completers analysis in the GCSWL is (n=15; -2.6 ± 2.1 kg) compared to the WLC (n=13; 0.6 ± 1.3 kg) (difference = -3.2, 95% CI -4.6, -1.8, $p < 0.001$) and intention-to-treat (GCSWL: -2.4 ± 2.2 kg; WLC: 0.5 ± 1.2 kg) (difference = -3.2, 95% CI -4.2, -1.6, $p < 0.001$). It is anticipated 12-week data collection for all 50 men will be completed December 2016. **Conclusion:** GCSWL participants are engaged in intervention sessions, attrition is low, and short-term weight loss

has been achieved. The intervention appears to be a feasible strategy to engage Hispanic males in weight loss/management. However, confirmation of these findings is needed upon study completion.

ASSOCIATIONS BETWEEN PARENTING FACTORS AND WEIGHT-STATUS IN OVERWEIGHT AFRICAN AMERICAN ADOLESCENTS

Lauren Huffman, MA, Dawn K. Wilson, Ph.D., FSBM

University of South Carolina, Columbia, SC

Close to 40% of African American adolescents are overweight nationally. However, there is limited research examining the relationship between authoritative parenting style (high nurturance and monitoring) and body mass index (BMI) in overweight, African American adolescents. The current study expands on previous literature by examining associations between parenting style, parenting behaviors specific to diet and physical activity (PA) including social support, autonomy support, home environmental supports, and modeling on predicting youth BMI. Analyses utilized baseline data from African American adolescents (N = 148; M_{age} = 13.5 years; 66% female; $M_{BMI\%}$ = 96.5) and their caregivers (M_{age} = 43.4 years; 94% female; M_{BMI} = 37.3) enrolled in the Families Improving Together (FIT) for Weight Loss randomized controlled trial. Parenting factors were measured using self-report surveys and daily minutes of PA were measured using 7-day accelerometry estimates. Child zBMI was calculated from objective height and weight measurements and standardized using CDC growth reference curves. Regression analyses indicated that the overall model was significant ($F(15, 132) = 2.38$, $p < 0.05$; $R^2 = 0.22$) with parenting variables accounting for significant variance in predicting BMI beyond covariates (child age, sex, diet, PA, and family income; ΔR^2=0.17, pB= -0.09, *SE*= 0.05) and parent BMI (weight-modeling) was positively associated with higher adolescent zBMI (*B*= 0.02, *SE*= 0.01). No other parenting effects specific to health behaviors were significant. Overall, these results suggest that general authoritative parenting and healthy weight modeling may be more closely associated with weight status compared to parenting behaviors specific to diet or PA in overweight, African American youth. This study is cross-sectional and future research is needed to more specifically test longitudinal and causal relationships.

COMMUNICATION BETWEEN TREATMENT-SEEKING ADULTS WITH OBESITY AND THEIR HEALTHCARE PROVIDERS

Jocelyn E. Remmert, B.A., Amani D. Piers, BA, Meghan L. Butryn, PhD

Drexel University, Philadelphia, PA

Introduction: Little is known on how obese treatment seeking adults interact with their primary care providers (PCPs) around weight control. These interactions could be a catalyst to lifestyle modification, but we do not know if, or how, positive weight control interactions are occurring in primary care. This study surveyed obese treatment seeking adults recently enrolled in a lifestyle modification program to gather information on these interactions, in hopes of identifying future targets for improved treatment engagement. **Methods:** Eighty-five adults enrolled in a large scale research obesity treatment trial were administered a survey upon enrollment to assess provider-participant interactions. The survey included Likert scale questions, where 1=strongly disagree and 7=strongly agree. **Results:** Two-thirds (64.7%) of participants spoke about weight loss to their PCPs prior to enrolling in this study; the other third (35.3%) never spoke about weight control with their PCPs. Of the participants who did speak to their PCPs about weight loss, 53.7% spoke about weight loss at 2-5 previous appointments, and 27.8% only spoke about weight loss at 1 previous appointment. Advice given by PCPs was: “lose weight” (n=19), attend structured weight loss program (n=15), monitor food intake (n=14), calorie counting/set a weight loss goal (n=11), exercise (n=11), and other options (see nutritionist, bariatric surgery, no white food) (n=10). On average, participants indicated they agreed to strongly agreed (6.55, SD=0.79) with the statement: “I feel comfortable talking to my provider about my weight.” Participants on average indicated they somewhat agreed (5.13, SD=1.47) with the statement: “I feel like my healthcare provider understands my barriers to weight control.” **Conclusions**: Overall the results suggest that there is variability in communication between treatment-seeking adults with obesity and their PCPs. While approximately one-third of participants had multiple conversations about weight control with their PCPs, one-third never spoke about weight control with their PCP. Understanding barriers and facilitators of communication will be important for future research. The results also suggest that providers may need additional support and resources in order to make evidence-based recommendations when discussing weight with their patients.

INCREASING EFFECT OF EXECUTIVE FUNCTIONING ON WEIGHT OUTCOMES THROUGHOUT BEHAVIORAL WEIGHT LOSS AND FOLLOW-UP

Emily Wyckoff, B.A.[1], Stephanie Manasse, MS[2], Talea Cornelius, M.A., M.S.W.[3], Meghan L. Butryn, PhD[2], Evan M. Forman, PhD[2]

[1]University of Connecticut, Storrs, CT; [2]Drexel University, Philadelphia, PA; [3]University of Connecticut, Vernon, CT

Group behavioral weight loss (BWL) is the current gold standard weight loss treatment; however, weight regain is normative and long-term outcomes are poor. Due to the decline in clinician contact and support as BWL treatment concludes, executive functioning (cognitive control processes that allow one to carry out goal directed behavior) may play an increasingly important role in maintaining adherence to dietary and physical activity recommendations. The current study tested the hypothesis that inhibitory control (i.e. one's ability to regulate automatic behavioral responses) and planning (i.e., generating mental representations of steps to achieve an intention) would positively predict weight loss in BWL treatment and follow-up. Additionally, we examined whether executive functions were increasingly predictive of outcome across BWL treatment phases and follow-up. It was hypothesized that poor executive functioning would increasingly predict poorer weight outcomes as group contact lessened and at follow-up.

Overweight and obese participants (n=190) received 25 group BWL treatment sessions over a 12-month period. At baseline, participants completed behavioral measures of planning (D-KEFS Tower Test) and inhibitory control (D-KEFS Color-Word interference Test). Assessment weights were collected at months 0 (baseline), 6 (mid-treatment), 12 (end-of-treatment), and 24 (follow-up).

Two multilevel models were run examining the effects of 1) inhibitory control and 2) planning on weight change. Both models revealed a negative, main effect of time on weight, *p*s < .001, as well as a quadratic effect of time, *p*s < .001. Participants had an initial decrease in weight, but this effect eventually tapered and reversed. Inhibitory control and planning interacted the quadratic effect of time on weight (inhibitory control: $B = -1.38$, $t(444.88) = 3.34$, $p < .001$; planning: $B = .30$, $t(444.20) = 3.03$, $p < .01$) such that those with poor inhibitory control and poor planning had similar weight loss months 0-6, lost more weight between months 6 and 12, and had slower regain months 12-24, compared to participants with better inhibitory control and planning ability.

Contrary to the hypothesis, results suggest that poor inhibitory control and planning are predictors of better outcomes in BWL. These findings could indicate that BWL may be most efficacious in the long term for those whose weight control challenges include poor planning and self-control, where as BWL may not address factors (e.g. unmeasured variables or even metabolic/biological factors) contributing to weight regain in those with better executive functioning. The somewhat counterintuitive results of this study highlight the need for treatment customization based on individual characteristics (e.g. executive functioning) as BWL does not consistently produce the enduring behavioral changes needed for weight loss maintenance.

INDIVIDUALS WITH OBESITY DID NOT ENGAGE IN GREATER EMOTIONAL EATING THAN THEIR LEAN COUNTERPARTS IN A LABORATORY SETTING

Laura Aylward, B.S.[1], Kristin Schneider, Ph.D.[2], Christine May, PhD[3], Sherry Pagoto, PhD[4]

[1]Rosalind Franklin University of Medicine & Science, Chicago, IL; [2]Rosalind Franklin University of Medicine & Science, North Chicago, IL; [3]University of Massachusetts Medical School, Fiskdale, MA; [4]University of Massachusetts Medical School, Worcester, MA

Background: The literature on the relationship between emotional eating and body mass index (BMI) is mixed, where some studies support an association between emotional eating and BMI and some do not. Many studies have examined emotional eating via self-report questionnaires, but less have examined emotional eating in a laboratory setting. The present study compared individuals with obese and lean BMI on difference in caloric intake during negative and neutral mood induction conditions. Greater caloric intake in negative mood condition versus neutral mood condition was considered "emotional eating."

Methods: Participants (n=61; 74% female, 39% obese) underwent neutral, anxiety, and anger mood inductions in counterbalanced order and received 2400 kcal of a variety of palatable foods immediately following. They were left alone for 20 minutes and calories consumed was measured via weighing leftovers. Participants with BMI of 18.5 to 25 were considered lean and 30 and above were considered obese. Emotional eating was measured as the difference in caloric intake between the negative and neutral mood conditions.

Results: Both mood inductions were found to significantly impact mood (anxiety $p < .001$ and anger $p < .001$) while the neutral mood induction had no impact on negative mood ($p>.05$). The condition by BMI interactions on food intake were not significant for the anxiety, $F(1, 177)=0.032$, $p=.857$, or anger conditions, $F(1, 177)=0.326$, $p=.569$.

Discussion: Lean and obese individuals did not differ in emotional eating, as defined by greater calories consumed following anxiety or anger induction relative to a neutral condition. Results are consistent with other studies reporting no relationship between emotional eating and BMI. Vulnerability to emotional eating is likely due to factors other than BMI.

PARENTS MISPERCEIVE THE WEIGHT STATUS OF GIRLS WHO ARE OVERWEIGHT OR OBESE

Daniella Carucci, B.A., M.S.[1], Sierra Bainter, Ph.D.[2], Mary Kate Clennan, B.S.[2], Marissa D. Alert, M.S.[2], Shannon Chiles, M.S[3], Qingyun Liu, N/A[2], Patrice G. Saab, Ph.D.[2]

[1]University of Miami, Miami, FL; [2]University of Miami, Coral Gables, FL; [3]University of Miami, Louisville, KY

Introduction:

Research suggests that parental misperception of child’s weight status is a predictor of childhood obesity. Parents’ underestimation of their child’s weight status can inhibit regulation of health behaviors and lead to less favorable health outcomes for children. The purpose of this study was to investigate whether parental perception of daughters’ weight status differed from actual weight status.

Methods:

The participants were a diverse sample of 267 middle school aged girls (M = 11.8 years). Approximately 88% of the participants were ethnic minorities and 56% came from communities with a poverty rate of 20% or higher, where the median family income was less than 80% of the median family income for the state. The participants' BMI was calculated after measuring height and weight. Approximately 3% of the girls were slightly or very underweight, 56% were average weight, 21% were overweight, and 20% were obese. Parental perception of weight status was determined by their response to the question “Describe your child’s weight.” Response options were “very underweight,” “slightly underweight,” “about the right weight,” “slightly overweight,” or “obese.” Because of the small number of girls rated as underweight, the underweight categories were combined in the analyses. Approximately 9% of the parents reported their child as slightly or very underweight, 66% reported average weight, 21% reported slightly overweight, and 4% reported obese.

Results:

Chi-square tests of independence were performed to determine whether parent perception of child’s weight status differed from the child’s actual weight status. The results indicated that there were differences in parent perception and the child’s actual weight status, c^2 (9, N = 267) = 206.58, $p < .001$. In fact, of the 57 girls in the “overweight” weight status, 64.3% were underestimated as “average” by their parents. Of the 55 girls in the “obese” weight status, 60.4% were underestimated as “overweight.”

Conclusion:

Understanding weight perception and identifying strategies to correct parents’ misperception may inform interventions targeting weight management efforts for overweight and obese children. As weight misperception is often influenced by cultural norms, early identification and interpretation of actual weight status may improve health outcomes for ethnically diverse young girls. Further research on the predictors of parental weight misperception is warranted to better serve these at-risk populations. Moreover, interventionists and clinicians should promote discussion of appropriate weight status between parents and children in efforts to adjust their perceptions and motivate weight-related behavior change.

PREFERRED WEIGHT TERMS AND WEIGHT DISSATISFACTION: A STUDY OF BLACK WOMEN IN THE SHAPE TRIAL

Christina M. Hopkins, B.S., Dori M. Steinberg, PhD, RD, Gary G. Bennett, PhD

Duke University, Durham, NC

Background: Obesity is not sufficiently treated in primary care. Only 20% of obese patients receive weight loss counseling, and uncertainty about patients' preferred terms for obesity may thwart treatment. No studies have investigated preferences of black women, a population that experiences disproportionately high rates of obesity.

Objective: To examine desirability of commonly used weight terms in a previously unexplored population of low-income Black women, and to identify the impact of weight satisfaction.

Method: Participants were 176 low-income Black women, involved in a weight gain prevention study (M_{age} = 35.5 ± 5.5 yr, M_{BMI} = 30.2 ± 2.5 kg/m^2). At baseline, commonly used weight terms were ranked for desirability on a 5-point Likert scale (1 = very desirable, 5 = very undesirable). Weight satisfaction was assessed on a 4-point Likert scale (1 = very satisfied, 4 = very unsatisfied). Participants were grouped by baseline weight satisfaction and group differences were analyzed using t-tests.

Results: More euphemistic terms (e.g., "weight") were rated as neutral (M=2.8±1.2); "weight" was rated as very undesirable by 9.7% of participants. Conversely, more blunt terms (e.g., "fatness") were rated as very undesirable (M=3.8±1.2) by 32.8% of women. On average, no weight-related term was rated as desirable.

Most participants (72.3%) reported weight dissatisfaction. Harsher terms were rated significantly less favorably by women who were unsatisfied with their weight (M=3.9±1.2), relative to women who were more weight satisfied (M=3.4±1.1, $p < .005$). Additionally, women with BMI > 34 kg/m^2 rated the harsher terms as more palatable than their peers in lower weight classes (ps < .05).

Conclusion: Euphemisms are preferred by patients, but differences by weight satisfaction and weight class warrant consideration. Women with weight dissatisfaction gave poorer ratings to the harsher weight-related terms. Conversely, women in the highest BMI class rated these terms more favorably, suggesting that women most in need of weight loss intervention are most able to tolerate terms that are currently seen as stigmatizing. Future research should

examine clinical effectiveness of the full range of weight-related terms to maximize impact for behavior change among a population most in need of treatment.

RECRUITING LOW INCOME POST-PARTUM WOMEN INTO A WEIGHT LOSS TRIAL: IN-PERSON VERSUS FACEBOOK DELIVERY

Valerie J. Silfee, PhD, Stephenie Lemon, PhD, Milagros C. Rosal, PhD

University of Massachusetts Medical School, Worcester, MA

Several studies, such as the Diabetes Prevention Program (DPP), have provided foundational evidence for the effect of lifestyle modification interventions on diabetes prevention and weight loss. However, translating these programs to the real-world has proven difficult. There remains a need to increase the feasibility and reach of translational weight loss interventions, particularly among socioeconomically disadvantaged populations. **PURPOSE:** To compare the recruitment rate of overweight low income postpartum women into a DPP-adapted behavioral weight loss program delivered in-person versus delivered via Facebook. We hypothesized that the Facebook-based trial may be easier to recruit for as the delivery mode may reduce participant burden (i.e. transportation, child care) compared to the in-person trial. **METHODS:** We compared two 8-week pilot behavioral weight loss trials; one delivered via weekly in-person group sessions and the other delivered entirely via Facebook. Both trials used the same recruitment methods: participants were overweight low income postpartum women within five Women Infants and Children (WIC) clinics in the Worcester, Massachusetts area recruited by nutritionists during routine WIC visits. Inclusion criteria included, childbirth in the previous 6 weeks to 6 months, age 18 or older, a body mass index (BMI) of ≥ 27 kg/m^2, and obstetric provider approval for participation in the diet and physical activity components of the intervention. Additional eligibility criteria for the Facebook intervention included: 1) ability to use the Internet daily; 2) having a Facebook account; 3) currently using Facebook at least once per week. **RESULTS:** 27 and 29 women participated in the in-person and Facebook pilot trials, respectively. Among eligible women, 62.1% gave permission to be contacted for the in-person trial, and 23.3% enrolled. 58.7% of women eligible for the Facebook pilot agreed to be contacted, and 24% enrolled. **CONCLUSIONS:** Recruitment rates for a Facebook-based weight loss intervention were similar to that of an in-person intervention, thus both programs may have the same reach. Future efforts are needed to increase reach of weight loss interventions among overweight and obese low income diverse women.

REST ETHIC: THE INFLUENCE OF BELIEFS ABOUT REST IN OVERWEIGHT BLACK WOMEN

T Jack Brooks, BA, Dori M. Steinberg, PhD, RD, Gary G. Bennett, PhD

Duke University, Durham, NC

Background Few Americans meet national physical activity guidelines. However, an expanding body of research suggests that sedentary time may confer additional health risks even among those who meet or exceed MVPA guidelines. We investigate the hypothesis that people who have positive attitudes about the health-promoting value of rest might prioritize rest over exercise for good health. Relatively little is known about how such attitudes toward rest affect patterns of physical activity and sedentarism. **Objective** This study investigates associations between “rest ethic” — beliefs about the health-promoting value of sedentary behaviors — and weight and physical activity. We also examined possible interactions with sociodemographic characteristics. **Methods** Data were collected during an 18-month weight gain prevention intervention (the Shape Program) conducted in North Carolina community health centers. Participants were 194 premenopausal black women diagnosed as overweight or obese. Rest ethic was measured by survey questions about the importance and benefits of resting, administered at baseline and 12 months. Weight was collected at baseline, 6, 12 and 18 months. Participants wore accelerometers for 14 days at baseline and 12 months. **Results** At baseline, participants had a mean BMI of 30.2. 68.5% of the sample reported that rest was somewhat/very likely to relieve stress. 88% reported that regular rest was somewhat/very important. There was no significant difference in beliefs about rest between treatment arms, and beliefs were overall stable from baseline to 12 months for both intervention and usual care arms. Belief about the importance of rest predicted weight change at 6, 12 and 18 months, with greater mean weight loss for participants who thought rest was not very important ($\bar{x}$=-2.23, -2.55, -4.19 lbs respectively) than for those who said rest was somewhat/very important ($\bar{x}$=-0.01, .18, .59 lbs respectively), $p < .05$. Demographic characteristics and accelerometer-measured physical activity were not significantly associated with rest beliefs. **Conclusions** Participants with high rest ethic — particularly those who believed rest was important for health — were more likely to to gain weight during the study, while those with low rest ethic tended to lose weight. Thus, rest ethic may be an important consideration in both weight loss and weight gain prevention.

RISK OF OBESITY-ASSOCIATED DISEASES BY BMI AND WAIST CIRCUMFERENCE AMONG CHILDBEARING RURAL WOMEN

Leigh Ann Simmons, Ph.D., M.F.T.[1], Devon Noonan, PhD[2], Tiffany Bice-Wigington, LMSW, PhD[3], Jewel Scott, MSN, FNP-C[1], Richard Sloane, MPH[4]

[1]Duke University School of Nursing, Durham, NC; [2]Duke University, Durham, NC; [3]Tarleton State University, Little Elm, TX; [4]Duke University Center for the Study of Aging, Durham, NC

Objective: Compared to their urban counterparts, rural women in the United States continue to experience significant disparities in rates of preventable chronic diseases and associated morbidity and mortality. Moreover, weight gain associated with childbearing has been identified as an independent risk factor for obesity-associated diseases, including type 2 diabetes, hypertension, and cardiovascular disease. The purpose of this study was to examine obesity-associated disease risk among childbearing rural women, including demographic and health correlates.

Data and Methods: We analyzed data from Rural Families Speak about Health, a multi-state, epidemiologic study of rural women and their families living in 11 states (N=444). Eligible women had at least one child aged 13 years or younger. Data were collected via computer-assisted, interviewer-administered questionnaires. Participants were classified according to the National Heart, Lung, and Blood Institute's risk classifications for type 2 diabetes, hypertension, and cardiovascular disease, which uses combined body mass index (BMI) and waist circumference as indicators of normal, increased, high, very high, and extremely high risk. Associations between disease risk status and demographic and health correlates were explored.

Results: The majority of participants were overweight (31.1%) or obese (45.3%); 19.8% were class I obese, 14% were class II obese, and 11.5% were class III obese, all exceeding national obesity rates for women. Despite a mean age of just 32.0 years, the sample had significant risk for obesity-associated diseases. Based on combined BMI and central adiposity indicators, 27.1% had high, 33.1% had very high, and 11.5% had extremely high risk. Factors associated with elevated disease risk included less than a high school education, part-time work, unemployment, and depression. There were no differences in risk status based on having a regular provider or receiving preventive care in the last year.

Conclusions: Risk for obesity-related diseases is high among childbearing rural women and

occurs well before the midlife years. Intervening in early adulthood and outside traditional clinical venues will be critical to reducing rural health disparities. Given that childbearing is frequently cited as a cause of weight gain for adult women, interventions during pregnancy as well as the postpartum and internatal periods, may provide the greatest benefit to improve the health status of rural female Americans.

SECONDARY BENEFITS OF FAMILIES IMPROVING TOGETHER WEIGHT LOSS TRIAL ON MENTAL AND SOCIAL WELLBEING IN AFRICAN AMERICAN YOUTH

Haylee Gause, BS[1], Dawn K. Wilson, Ph.D., FSBM[1], Heather Kitzman-Ulrich, PhD[2], Brittany Haney, BA[3], Kayla Ford, N/A[1]

[1]University of South Carolina, Columbia, SC; [2]Baylor Scott & White Health, Dallas, TX; [3]University of South Carolina, West Columbia, SC

The Families Improving Together (FIT) for weight loss trial is a randomized controlled trial to test a positive parenting and motivational intervention on promoting weight loss in overweight African American adolescents. While the intervention focuses on decreasing weight there may be cascading effects on other secondary benefits for adolescents and their families. These secondary benefits could improve both mental and social wellbeing beyond the health benefits of losing weight. The purpose of this study was to examine the potential improvements beyond weight loss to increase understanding of the program's impact on participants overall wellbeing. This was accomplished through the development of an evaluation tool using qualitative methods. Data was obtained from African American adolescents (N = 148; M_{age} = 13.5 years; 66% female; $M_{BMI\%}$ = 96.5) and their caregivers (M_{age} = 43.4 years; 94% female; M_{BMI} = 37.3) who took part in the FIT trial. An evaluation tool was created to quantitatively evaluate family's qualitative responses during the final week of the program in which they provided testimonials of their successes and challenges. A top-down approach was used to identify themes based on Social Cognitive Theory in a total of 9 different intervention groups of Project FIT that have been completed to date. Transcriptions from each intervention session were developed and coded for themes related to health, social, and cognitive benefits including but not limited to family support, positive communication, autonomy, self-efficacy, self-regulation, and monitoring strategies for weight, physical activity, and diet behaviors. The inter-rater reliability was 0.80. The majority of themes addressed cognitive benefits related to improving self-regulation and skills for relapse prevention. Families also reported increases in social support and positive communications between youth and their parents. This evaluation tool may be used in future research to understand how weight loss programs lead to secondary benefits for individuals and their families and provides preliminary support for the ripple effects of weight loss programs on improving both cognitive and social wellbeing in underserved African American youth.

TITLE: AN APPETITE AWARENESS INTERVENTION FOR AT RISK YOUNG WOMEN: A RANDOMIZED CONTROLLED TRIAL

Lara LaCaille, PhD[1], Claire L. Guidinger, BA[1], Lauren Vieaux, MA[2], Rick LaCaille, PhD[1], Brooke Collins, BS[3], Courtney Clark, N/A[1], Maggie Mason, NA[4]

[1]University of Minnesota Duluth, Duluth, MN; [2]University of Minnesota Duluth, Little Canada, MN; [3]University of Minnesota Duluth, Superior, WI; [4]University of Minnesota- Duluth, Buffalo, MN

Weight gain among college freshmen women is a common concern, and research suggests that this is a time of risk for the development of unhealthy eating patterns and weight change. The current randomized clinical study evaluates the efficacy of a brief intervention aimed at increasing an individual’s ability to eat intuitively based on bodily hunger and satiety cues, thereby potentially preventing weight gain and disordered eating. A pilot study was conducted with 34 college freshman women in Fall of 2015 and was replicated with a larger sample in Fall 2016. In total, 129 women were randomly assigned to one of three conditions: Appetite Awareness Training (AAT; *n*=45), Nutrition Education (NE; *n*=42), or a no-treatment control (NTC; *n*=42). Treatment groups received four group sessions over 6 weeks. Outcomes assessed at baseline, post-intervention, and 4-month follow up included: weight, BMI, % body fat, waist circumference, measures of self-efficacy to manage weight and to resist eating in a variety of contexts, intuitive and restrictive eating patterns, and overeating frequency. Repeated measures ANOVAs, with follow up contrast tests, were conducted to explore group differences over time. Data from the pilot study indicated that both the AAT and NE groups lost weight, whereas the control group gained weight [p=.05, η^2=.17 (large effect)]. Both treatment groups also reported a greater increase in weight maintenance self-efficacy than the NTC [p=.04, η^2=.18 (large effect)]. There was a smaller effect for ability to resist eating across a variety of contexts, though the AAT group showed the greatest increase in control in situations where food was highly available. Preliminary evidence suggests that brief group interventions were effective compared to no intervention. It is anticipated that the AAT group may be more likely to sustain weight gain prevention in the long term. Post-treatment and 4-month follow up data from the larger replication study will be presented, along with 1-year follow up data from subjects in the pilot study. Implications and evaluation of interventions will also be discussed.

NATURALLY-OCCURRING PAIN CONVERSATIONS WITHIN THREE CLINICAL SAMPLES AS AN ALTERNATIVE MEASURE TO SELF-REPORTED PAIN

Robert C. Wright, MA, Megan Robbins, PhD

University of California, Riverside, Riverside, CA

Pain is a complex, subjective experience which is difficult to fully measure with a simple self-report. Because pain is not confined to a medical visit and unfolds through patients' daily experiences, it is paramount to access the pain experience with methods beyond traditional measures. To explore how patients naturally discuss pain, three clinical groups, rheumatoid arthritis (RA; n=13), breast cancer (BC; n=52), and major depressive disorder (MDD; n=29), wore the Electronically Activated Recorder (EAR) over a weekend. The EAR captured snippets of ambient sound, totaling in roughly 10% of the patients' waking day. The patients' audio recordings were transcribed. A pain-specific Linguistic Inquiry and Word Count dictionary was developed and validated, and then used to identify patients' pain-related conversations. Self-reported pain measures were completed just prior to the recording weekend. As predicted, the proportion of pain conversations to total conversations was highest in the RA group (11%; 95% CI [-5.8, 28.64]), then BC (9%; 95% CI %, [1.41, 17.19]), and MDD (5%; 95% CI [-0.02, 10.48]) groups. Correlational analysis showed a trend between the proportion of pain conversations in the RA group and their reported pain in the past week (r = .53, p=.09) and a marginal relationship to pain in the past month (r = .43, p=.14). The other two groups showed small, nonsignificant positive relationships to self-reported pain (r's < .20), suggesting little overlap between self-reported pain and mentions of pain in daily conversation. Interestingly, in an analysis of the types of words used, patients used more cognitive processing words (e.g. cause, know, ought), in pain versus non-pain conversations, $t(81) = 3.60$, $p < 0.01$, $d = .398$. The linguistic differences in the types of language used in pain and non-pain conversations may indicate an active form of coping such as reappraisal. Notably, this study was one of the first to show patients naturally discuss pain in their everyday lives. Ultimately, this study adds insights into how patients discuss pain without being prompted by a researcher or clinician. The insights gained from this research illuminate important paths to improving the pain experience.

PAIN CATASTROPHIZING AND COGNITIVE FUSION IN RELATION TO PAIN AND UPPER EXTREMITY FUNCTION AMONG HAND SURGERY PATIENTS

Sezai Ozkan, MD[1], Emily Zale, MS[1], David Ring, MD[2], Ana-Maria Vranceanu, PhD[1]

[1]Massachusetts General Hospital/Harvard Medical School, Boston, MA; [2]The University of Texas at Austin, Dell Medical School, Austin, TX

Objective: Patients who present to hand surgery practices are at increased risk of psychological distress, pain, and disability. Catastrophic thinking about pain is associated with greater pain intensity, and initial evidences suggest that, together, catastrophizing and cognitive fusion (i.e., the tendency to interpret thoughts as true or representative of reality) are associated with poorer pain outcomes. We tested whether cognitive fusion and catastrophizing interact in relation to pain and upper extremity limitations among patients seeking care from a hand surgeon.

Methods: Patients (N = 110; Mage = 47.51; 59% women) presenting to an outpatient hand surgery practice completed computerized measures of sociodemographics, pain intensity, cognitive fusion, pain catastrophizing, and upper extremity limitations.

Results: ANCOVA revealed an interaction between cognitive fusion and catastrophic thinking with respect to pain intensity ($p < .01$). Participants who scored high on both cognitive fusion and catastrophic thinking reported the greatest levels of pain relative to those who scored high on a single measure. The interaction between cognitive fusion and catastrophizing was also associated with upper extremity limitations ($p < .01$) with the greatest levels of upper extremity limitations among those who scored high on both catastrophic thinking and cognitive fusion. A similar pattern of results was observed when we tested each catastrophizing subscale individually.

Conclusion: Pain intensity and upper extremity limitations were poorest among hand surgery patients who reported high levels of both catastrophic thinking and cognitive fusion. Maladaptive cognitions about pain (i.e., catastrophic thinking) may be particularly problematic when interpreted as representative of reality (i.e., cognitive fusion). Psychosocial interventions that address catastrophic thinking and cognitive fusion concurrently merit investigation for alleviation of pain and limitations among people with arm illness.

SEX AND GENDER DIFFERENCES IN CHRONIC PAIN-RELATED DISABILITY

Mindy L. McEntee, M.S., Kevin E. Vowles, PhD

University of New Mexico, Albuquerque, NM

Sex and gender differences in chronic pain are nuanced and contextual. However, the extent of these differences and the degree to which they impact assessment remains unclear. In 2007, the International Association for the Study of Pain put forth recommendations suggesting that while the same general measures should be used to assess chronic pain in men and women, additional research was needed to determine whether these assessments need to be further tailored by sex or gender. To date, however, it remains unclear whether current measures of functioning perform adequately for both men and women. The present study: 1) evaluated a newly abbreviated measure of functioning developed for chronic pain patients, the SIP-CP in a sample of 808 men and women seeking treatment for their chronic pain and 2) examined sex differences in chronic pain disability, pain-related acceptance, and pain-related anxiety. Items of the SIP-CP were entered as dependent variables into a confirmatory factor analysis (CFA) to verify the proposed two factor structure (Physical and Psychosocial disability). Measurement invariance of the SIP-CP was then tested at configural, metric, and scalar levels for men and women using WLSMV estimation with a probit link and THETA parameterization to estimate all models, with model fit statistics describing the fit of the polychoric correlation matrix among items for each group. Sex differences on disability subscales, pain-related acceptance, and pain-related anxiety were examined using one-way ANOVAs.The CFA supported the two factor structure of the SIP-CP with adequate fit across indices (RMSEA= 0.35, 90% CI [0.32, 0.38], CFI=0.92, and TLI=0.92). Individual items accounted for 26%-68% of the variance in physical disability and 16%-64% of the variance in psychosocial disability. Measurement invariance was supported at the configural and metric levels, suggesting that the physical and psychosocial disability scores of the SIP-CP adequately assess the same construct in both men and women. Sex differences were found for the Physical disability domain score and the social interaction subscale score (both $p < .001$) of the SIP-CP, with men reporting greater disability. While there is evidence that sex and gender influence chronic pain, additional research is needed to clarify the extent and overall impact of these differences on assessment and treatment. At present, the SIP-CP appears to be a valid measure assessing the same construct of chronic pain for both men and women.

THE EFFECTS OF DURATION OF SYMPTOMS ON HEALTH STATUS DEPENDS ON SELF-EFFICACY LEVELS

Mathew M. Mansoor, Bachelor of Arts in Psychology[1], Symone McKinnon, Bachelors of Arts in Psychology[2], Charles Van Liew, MA[3], Lauren E. McKinley, Student[1], Terry A. Cronan, Ph.D.[1]

[1]San Diego State University, San Diego, CA; [2]San Diego State University, La Mesa, CA; [3]Grand Canyon University, San Diego, CA

Fibromyalgia Syndrome (FMS) is a chronic musculoskeletal pain disorder characterized by symptoms of fatigue, stiffness, depression, and diminished physical functioning. Age and duration of symptoms predict the health status of FMS patients. However, researchers have not examined whether the effects of duration of symptoms on health status depends on the patients'self-efficacy levels. The purpose of the present study was to examine these relationships. Participants were 573 women diagnosed with FMS, recruited from a health maintenance organization who were part of a larger intervention study. Data were analyzed using the baseline measures. Age and symptom length were collected using a demographic questionnaire. Self-efficacy (SE) and health status were measured via the Arthritis Self-efficacy Scale, modified for FMS, and the Fibromyalgia Impact Questionnaire (FIQ). A linear regression was performed to assess the effects of age, symptom length, and SE on FIQ scores. All predictors were centered. An interaction term was included to test whether the effect of symptom length on FIQ depended on SE levels. The overall model was statistically significant, $F(4, 566) = 89.33$, $p < .001$, and accounted for 38.7% of the variance in FIQ scores. The main effects of age, $B = -.2895$, $p < .001$, and SE, $B = -.5319$, $p < .001$, were significant, as was the interaction of symptom length with SE, $B = -.0046$, $p = .04$. The main effect of symptom length was not significant when the interaction was included in the model, because its moderation by SE was qualitative (i.e., the direction of the effect of symptom length changed across SE levels). The main effects of age and SE demonstrated that, as individuals aged and had higher SE scores, they had lower FIQ scores (i.e., less FMS impact).The interaction of symptom length by SE showed that longer duration of symptoms predicted greater FMS impact for those who have low self-efficacy, but for those who have high self-efficacy, longer symptoms predicted less FMS impact. These findings indicate that interventions designed to increase self-efficacy may reduce the effect of FMS as patients age.

THE MEDIATING ROLE OF SOCIAL SUPPORT IN THE RELATIONSHIP BETWEEN MINDFULNESS AND CHRONIC PAIN : A LONGITUDINAL EVIDENCE

Shin Ye Kim, Ph.D., Monika Gaspar, MA

Texas Tech University, Lubbock, TX

More than 100 million Americans suffer from Chronic Pain (CP). This is four times more than people with Diabetes and 10 times more than Cancer patients (Institute of Medicine Report, 2010). As CP is a widespread and stressful condition, it also has a significant impact on patients' intrapersonal (e.g., depression, anxiety) and interpersonal (e.g., social isolation, relational satisfaction) functioning (Breivik et al. 2006).

In understanding CP from a biopsychosocial framework, prior research has identified benefits of both dispositional mindfulness (Turner et al., 2016) and the role of social support (e.g., Evers, et al., 2003) across younger, middle age, and, to a lesser extent, older adults with CP. Curiously, few studies have examined the postulated links between CP and mindfulness or between the role of social support and adjusting to a CP condition, and no study to date has directly tested the possible mediating effect of social support in the relationship between one's engagement in mindful living and CP conditions among older adults; therefore, the extent and nature of these theorized relations is unclear. One purpose of this study was to extend the current understanding of the relation between mindfulness living and CP conditions among older adults by examining antecedent-consequent relations of mindfulness, social support, and CP.

The present study utilized two waves of data collected 9 to 10 years apart from 3294 participants of the Midlife Development in the United States Survey (MIDUS) (M age = 56.27 years, SD=12.4; 55.4% female; 88.7% White). We applied (multigroup) change score to two waves of data. Dispositional mindfulness was measured by the MIDUS-II Mindfulness scale, which is based on Langer and Moldoveanu's (2000) conception of mindfulness. Social support was assessed with 24 items, 8 of which asked about the social support and social strain associated with each of three sources, spouses/partner, family, and friends. CP conditions were assessed with participants' self-report of whether pain disorder was diagnosed by physician, pain medication use frequency, duration of CP, and degree to which pain interfered with activity and mood.

Analyses revealed evidence for direct and independent multidirectional accounts. Greater mindfulness predicted lower CP scores and greater social support. In turn, increases in mindfulness were predicted by greater social support and lower CP scores. Additionally, using 50,000 bootstrapped samples, mindfulness was found to have a significant indirect effect on CP conditions as mediated by social support. This is the first study to demonstrate a possible psychosocial mediator of mindfulness in a national sample of midlife and older adults. Implications are discussed in terms of possible intervention studies that target enhancement of social support in mindfulness-based CP management.

A SOCIAL MEDIA APPROACH TO INFLUENCE LIFESTYLE PHYSICAL ACTIVITY IN NAVY RESERVISTS: THE ACTIVE RESERVES (ACRE) TRIAL

Neil Goldstein, Bachelor of Arts - Exercise Science, Thomas Wojcicki, PhD

Bellarmine University, Louisville, KY

In an effort to create a culture of year-round fitness, the US Navy is seeking innovative programs to assist in the promotion of health-related behaviors, such as physical activity (PA). A recent examination of Physical Readiness Test scores of Reservists (N=189) from the Naval Operational Support Center in Louisville, KY, further highlights this need, as 13.2% failed this assessment due to poor fitness, and an additional 19.6% barely met the minimum criteria for passing. The purpose of the AcRe Trial was to examine the feasibility and efficacy of delivering an 8-week lifestyle PA intervention to a sample of low-active Navy Reservists (N=15; Mage=33.80 years) entirely over Facebook. Primary outcomes included changes in health-enhancing PA (assessed at baseline and 8-week follow-up), as well as post-intervention evaluations regarding program delivery and usefulness. Participants were randomized to either a social cognitive-based condition (i.e., Behavioral group) or an attentional control (i.e., Informational group). Both conditions received access to a study-specific Facebook Group, where they received and engaged with PA-related information and resources specifically aimed at military personnel, as well as adult civilians. Participants in the Behavioral group also received weekly video-based behavioral modules designed to promote PA. Effect sizes (Cohen's d) were calculated within groups to determine differential treatment effects on PA. Results revealed that involvement in the Behavioral group produced greater effects on PA compared to the Informational group. Specifically, the Behavioral group experienced large and positive changes in moderate-vigorous PA (d=1.40), whereas the Informational group experienced small to moderate declines (d=-0.44). Post-intervention evaluations revealed that participants found the AcRe Trial to be very useful and that they would consider participating in a similar social media-delivered program again (agree=60%, strongly agree=40%, respectively). These results suggest that a theoretically-based intervention delivered via social media has the potential to positively influence PA levels in low-active Reservists. This practical and well-received approach to promoting PA could be easily modeled and adapted to meet the dynamic needs and health-related goals of the reserve component of the US Navy – a critically understudied population, which plays a paramount role in the continuity of national defense and security.

"IT'S HARD TO MANAGE CONFLICTING LEISURE GOALS": DO CONCURRENT GOAL-RELATED COGNITIONS PREDICT EXERCISE VOLUME?

Jocelyn Blouin, BSc. Kin. (Hon.)[1], Nancy C. Gyurcsik, PhD[2], Larry R. Brawley, PhD[2], Kevin Spink, Professor[2]

[1]University of Saskatchewan, North Battleford, SA, Canada; [2]University of Saskatchewan, Saskatoon, SA, Canada

According to social cognitive theory (SCT), concurrent management of exercise and other highly valued leisure goals may compete and challenge successful exercise self-regulation. Concurrent goal-related cognitions may be self-regulatory mechanisms important for planned exercise engagement. Concurrent self-regulatory efficacy (SRE), or confidence to concurrently manage multiple goals including exercise, has been predictive of adults' exercise. Intergoal conflict, or the extent that concurrent goals conflict, is suggested to predict exercise. However, studies have not supported the prediction. The lack of support may be because a truly challenging conflict between concurrent goals was never examined. Specifically, participants' exercise and non-exercise goals were not highly valued and thus did not conflict with each other. Our purpose was to examine whether adults' perceived intergoal conflict enhanced exercise prediction beyond concurrent SRE when concurrent goals were conflicting and highly valued. Healthy adult exercisers (N = 112; M_{age} = 30.9 ± 10.5 years) reported a highly valued (≥ 6 on a 1 to 9 value response scale) exercise and concurrent non-exercise leisure goal. Concurrent SRE, intergoal conflict, and moderate-vigorous exercise volume over the prior month were also assessed. Hierarchical multiple regression was used to examine the relationship between goal-related cognitions and exercise. Step 1 included concurrent SRE and step 2 included intergoal conflict. The overall model was significant, $F(2, 109) = 8.95$, $p = .001$, $R^2_{\text{adjusted}} = .13$, with concurrent SRE as the sole significant predictor, $\beta = .32$, $p = .001$. The concurrent SRE finding supports SCT contentions that SRE beliefs are predictive of goal-directed behavior when goals compete. But this is specific to exercisers who have mastery experiences. In contrast, exercise initiates may be more likely to have goal conflicts that they need to learn how to master. Future research should prospectively examine intergoal conflict and concurrent SRE among adults who initiate exercise and follow the predictors of their adherence trajectory over time. Such a study might offer insight on when intergoal conflict does and does not matter.

ADAPTIVE GOAL SETTING AND FINANCIAL INCENTIVES: A 2 X 2 FACTORIAL RANDOMIZED TRIAL TO INCREASE PHYSICAL ACTIVITY AMONG ADULTS

Marc A. Adams, PhD, MPH[1], Jane C. Hurley, MS[1], Michael Todd, PhD[1], Nishat Bhuiyan, B.S.[2], Catherine Jarrett, MS[1], Wesley J. Tucker, PhD RD[3], Kevin Hollingshead, BSEET[4], Siddhartha S. Angadi, PhD[5]

[1]Arizona State University, Phoenix, AZ; [2]The Pennsylvania State University, State College, PA; [3]University of Texas at Arlington, FORT WORTH, TX; [4]Arizona State University, Scottsdale, AZ; [5]Arizona State University - Downtown Phoenix Campus, Phoenix, AZ

Purpose: Recent perspectives in health behavior theory propose that behavior, such as physical activity, has temporal dynamics that are unique to each individual. Emerging interventions that rely on and harness such variability and adapt intensively to individuals over time may outperform static interventions that prescribe static goals (e.g., 10,000 steps/day). The purpose of this study was to compare adaptive goal setting and immediate financial rewards to static goal setting and delayed, non-contingent rewards for promoting free-living physical activity (PA).

Methods: A 4-month 2x2 factorial randomized trial tested main effects for goal setting (adaptive vs. static goals) and reward (immediate vs. delayed) and interactions between factors to increase physical activity as measured by a Fitbit Zip. This analysis reports the secondary outcome of changes to minutes of moderate-to-vigorous PA (MVPA) using previously validated minute-level cadence thresholds. Static goals (10,000 steps/day) did not change while adaptive goals adjusted up or down daily over the course of the 4 months using a percentile-rank algorithm based on sliding window of a participant’s performance. Immediate financial incentives were made available for goal attainment while delayed, non-contingent incentives were provided monthly for participation.

Results: Participants (N=96) were mainly female (77%), aged 41 ±9.5 years, and all were overweight/obese (mean BMI = 34.1 ±6.2). Participants across all groups increased by 12.2 min/day from baseline to intervention phase on average ($p < .001$). Participants receiving static goals increased by 2.5 min/day more on average compared to adaptive goals regardless of reward group ($p = .11$). Participants receiving immediate rewards increased by 4.7 min/day more on average compared to the delayed rewards regardless of goal-setting group ($p = .006$). Average rate of change during the intervention phase differed statistically between groups, and showed that MVPA for participants receiving adaptive goals decreased at a slower rate

(2.5 seconds less per day, *p* = .005) on average, compared to participants receiving static goals, such that by the end of the 4-month intervention phase, participants receiving adaptive goals differed by 4.6 min/day compared with static goals, on average. Rate of change did not differ between reward groups during the intervention phase. Significant interactions between goal setting and reward factors were observed.

Conclusions: This study evaluated independent and joint contributions of daily goal setting and financial incentives for increasing MVPA min/day. The factorial design further allowed for exploring the optimized version of these interventions. These results contribute to advancement of the science of optimizing behavioral interventions for promoting physical activity among adults.

ARE CARDIAC PATIENTS MEETING PHYSICAL ACTIVITY GUIDELINES?

Bernice Yates, PhD, RN[1], Bunny Pozehl, PhD, APRN[2], Kevin A. Kupzyk, PhD[1], Crystal Epstein, MSN, APRN[1], Pallav Deka, BSN, MS, PhD (c), RN[2]

[1]University of Nebraska Medical Center, Omaha, NE; [2]University of Nebraska Medical Center, Lincoln, NE

Title: Are Cardiac Patients Meeting Physical Activity Guidelines?

Purpose: Physical inactivity is an important independent risk factor for coronary heart disease. In primary and secondary prevention of coronary heart disease, it is recommended that individuals achieve > 150 minutes/week of > moderate intensity physical activity (PA) accumulated in at least 10 minute bouts. Although this amount is recommended, few studies have examined how many community-dwelling cardiovascular patients achieve this recommendation. The purpose of this study was to describe subjective and objective physical activity (PA) levels of two groups of cardiovascular patients who were either post-coronary artery bypass graft (CABG) surgery or diagnosed with heart failure (HF).

Methods: A descriptive comparative design was used for this secondary analysis of data from two prior studies. A convenience sample of 62 outpatients was used to examine PA objectively (Actiheart accelerometer) and subjectively (PA interview). HF and CABG patients were compared using were examined using Mann-Whitney U statistics.

Results: Based on accelerometer data, HF patients engaged in < 1 minute of moderate-to-vigorous physical activity (MVPA) per day. They engaged in more light activities (1.6 – 2.9 METs) than moderate-vigorous activities (18.2 min/d). Thirty eight percent of HF patients met the national guidelines of > 150 min/wk by self-report; however, none met the guidelines based on accelerometer data. CABG patients engaged in 18.5 minutes of MVPA per day (129.5 min/wk) based on accelerometer data. They also engaged in more light than MVPA (146.8 min/d). Fifty-six percent of CABG patients met the national guidelines of > 150 min/wk based on self-report; however, only 33% met the guidelines based on accelerometer data. CABG patients were significantly more active than HF patients as evidenced by significantly greater minutes spent in light and moderate-to-vigorous activity.

Conclusions: Few cardiac patients in the current study met PA recommendations. Innovative intervention strategies are needed (e.g., use of activity trackers, making PA a vital sign) to

assist patients in gaining the knowledge and skills to be more active and adhere to PA recommendations.

ASSOCIATION BETWEEN CHANGES IN PHYSICAL ACTIVITY & DEPRESSIVE SYMPTOMS & PERCEIVED STRESS IN ADULTS WITH DIABETES & CHRONIC PAIN

Susan Andreae, PhD, MPH[1], Susan L. Davies, PhD[1], Joshua Richman, MD PhD[2], Andrea Cherrington, MD MPH[3], Monika Safford, MD[4]

[1]University of Alabama at Birmingham, Birmingham, AL; [2]UAB, Birmingham, AL; [3]University of Alabama at Birmingham, Division of Preventive Medicine, birmingham, AL; [4]Weill Cornell Medicine, New York, NY

Background: Individuals with diabetes often experience higher than average symptoms of stress and depression. Barriers to addressing stress and depression include negative attitudes and beliefs regarding mental health care, distrust of the mental health care system, and stigma related to mental illness. A promising approach to alleviating such symptoms may be through the use of physical activity (PA) and exercise. We examined the effects of the change in PA levels on depressive symptoms and perceived stress levels in a sample of primarily African American adults in rural Alabama.

Methods: The study included adults with diabetes and chronic pain enrolled in the intervention arm of a community-based, cluster- randomized controlled trial testing a 12-week program that included cognitive reframing to increase physical activity. Depressive symptoms were assessed using the Iowa short form of the Centers for Epidemiological Data Scale. Perceived stress levels were measured using the 10-item Perceived Stress Scale. PA levels were assessed using questions that measured intensity and frequency of PA, perception of one’s own PA compared to others of the same age, and usual daily PA levels. Linear regression with generalized estimating equations were used to account for the clustering and longitudinal nature of the data.

Results: The 93 participants in the study had a mean age of 59.9 (± 9.8 SD) years, 98% were African Americans, 84% were female, 73% reported annual income of less than $20,000, and 65% had a high school education or lower. Change in usual daily activity levels were associated with changes in perceived stress levels (β=-2.7 [-5.02, -0.35] $p < 0.05$), but not with changes in depressive symptoms.

Discussion: Increases in reports of usual daily PA levels were associated with decreased levels of perceived stress but not depressive symptoms in this cohort. Future studies are needed in order to better understand the relationship between depression, stress, and physical activity in other communities, to assess the directionality of the relationships, and to understand the mechanisms through which PA may affect depression and stress

ASSOCIATION BETWEEN PA AND SELF-EFFICACY FOR PAIN MANAGEMENT AND DIABETES MANAGEMENT IN ADULTS WITH DIABETES AND CHRONIC PAIN

Susan Andreae, PhD, MPH[1], Susan L. Davies, PhD[1], Joshua Richman, MD PhD[2], Monika Safford, MD[3], Andrea Cherrington, MD MPH[4]

[1]University of Alabama at Birmingham, Birmingham, AL; [2]UAB, Birmingham, AL; [3]Weill Cornell Medicine, New York, NY; [4]University of Alabama at Birmingham, Division of Preventive Medicine, birmingham, AL

Introduction: In addition to preventing chronic disease and premature death, physical activity (PA) may have immediate and positive effects on self-efficacy and confidence. Emphasizing these quickly noticeable effects of PA may be a more effective method to promote PA compared to focusing on long-term benefits (e.g., prevention or control of disease). We examined the relationship between PA with diabetes management self-efficacy and pain management self-efficacy in a sample of minority adults with diabetes and chronic pain.

Methods: Our sample was the intervention arm of a community-based, cluster-randomized controlled trial testing the effectiveness of a 12-week community health worker delivered program that emphasized cognitive reframing on diabetes outcomes in individuals with chronic pain and diabetes. Diabetes management self-efficacy was assessed using the Perceived Diabetes Self-Management Scale. Pain management self-efficacy was assessed using the pain management self-efficacy subscale of the Arthritis Self-Efficacy Scale. PA was measured using questions assessing intensity and frequency of PA, perception of PA compared to others, and usual daily PA levels.

Results: Of the 93 study participants, 98% were African American, 84% were women, 73% reported an annual income of less than $20,000, and 63% had a high school education or lower. The mean age of participants was 60±9.9 SD years. There were positive and significant associations between the change in perception of PA compared to others and change in pain management self-efficacy levels ($\beta=3.89$ [0.53, 7.26], $p < 0.05$). There were no significant associations between measures of PA and diabetes management self-efficacy.

Conclusion: Increases in the perception of one’s own PA levels compared to others were associated with improvements in pain management self-efficacy. Reframing the benefits of PA

to include affective benefits such as improvements in self-efficacy may be a potential strategy to promote PA.

DECREASES IN PHYSICAL ACTIVITY AND PUBERTAL MATURATION: TESTING EVOLUTIONARY HYPOTHESES AMONG THE TSIMANE' OF LOWLAND BOLIVIA

Annie Caldwell, PhD[1], Paul Hooper, PhD[2]

[1]University of Colorado, School off Medicine, Aurora, CO; [2]Emory University, Atlanta, GA

Understanding factors that affect physical activity can have tremendous public health implications. Epidemiological studies have consistently demonstrated decreases in physical activity during adolescence in modern, Western contexts. This trend is typically interpreted as adolescents' adopting unhealthy behaviors in response to the psychosocial stress of puberty, similar to smoking, drinking, or risky sexual behaviors. Much less is known about physical activity patterns across adolescence in pre-Industrial settings. In the current study, we utilized an evolutionary, life history framework to examine physical activity across adolescence among a cross-section of young Tsimane' individuals (N=110; age 8-22). The Tsimane' are forager horticulturalists that live in small villages in the Amazon region of lowland Bolivia. They have a subsistence based economy that requires much higher levels of obligatory physical activity to produce food, water, and shelter. We tested the hypothesis that the Tsimane' would exhibit similar decreases in physical activity and increases in sedentary behavior across adolescence, despite having higher levels of obligatory physical activity. We specifically tested the hypotheses that physical activity trades-off against energy devoted to reproductive maturation, and is sensitive to individual energetic condition. Physical activity was measured objectively using Actigraph tri-axial accelerometers; investment in pubertal maturation was measured with Tanner stage, urinary DHEA and testosterone; and energetic condition was measured with urinary C-peptide and serum HbA1c. Minutes of the day spent being sedentary significantly increased with Tanner stage ($\beta = -28.66$, $t = 3.47$, $p < 0.001$) controlling for age and sex. Minutes of the day spent in moderate to vigorous physical activity significantly decreased with Tanner stage ($\beta = -9.00$, $t = -2.00$, $p < 0.05$), controlling for the age and sex. Further, the relationship between DHEA and physical activity was moderated by C-peptide, such that those who were in poorer energetic condition, exhibited steeper decreases in activity with increasing levels of DHEA. Results will be interpreted from a life history framework and considered in light of implications for public health and health disparities in modern contexts.

EASING THE TRANSITION TO COLLEGE: COMPARING PHYSICAL ACTIVITY AND MINDFULNESS INTERVENTIONS AMONG FIRST-YEAR STUDENTS

Pamela J. Lundeberg, M.A.[1], Dan J. Graham, PhD[2]

[1]Colorado State, Fort Collins, CO; [2]Colorado State University, Fort Collins, CO

Background: Engaging in physical activity (PA) is associated with an array of physical benefits (e.g., increased longevity, enhanced cardiovascular functioning, and a reduced risk for chronic diseases). In addition, PA offers numerous benefits for psychological health (e.g., decreased risk for depression and anxiety, reduced stress, and enhanced mood). Many of the psychological benefits of PA are also associated with mindfulness training, which – like PA – has demonstrated efficacy in improving attention, increasing self-control, and reducing stress. As PA and mindfulness offer similar psychological benefits, the present study sought to compare the two among first-year college students, a group of individuals experiencing significant stress as they transition to the university setting.

Method: First-year college students (N = 52) voluntarily elected to participate in a 4-week PA or mindfulness workshop (with weekly 75-minute sessions led by a certified instructor) during which students learned methods of and benefits of practicing PA or mindfulness. Additionally, participants practiced newly learned techniques in the workshop sessions (i.e., students engaged in different types of PA or mindfulness). The PA and mindfulness workshops were built to parallel each other in terms of relative content and structure, and both workshops emphasized college adjustment outcomes (e.g., stress reduction). Outcome variables were measured prior to the start of the workshop (T1) and at the final workshop (T2).

Results: Preliminary analyses indicate greater efficacy for the PA intervention compared to the mindfulness program. Students in the PA group reported lower perceived stress, higher positive affect, lower homesickness, and higher self-efficacy at T2 compared to T1. Additionally, participants in the PA group reported higher global health and an increase in perceived benefits of PA at T2 compared to T1. Participants in the mindfulness group did not report changes from T1 to T2 in any of the measured outcome variables related to college adjustment.

Conclusions: First-year college students completing a 4-week PA intervention reported acquiring useful knowledge and gained competency in multiple PA modalities. Furthermore, participants in the PA group reported an increase in college adjustment outcomes after

participating in the 4-week PA workshop, suggesting a benefit of utilizing PA as a method of easing the transition to college.

ENHANCING ACCESSIBILITY OF PHYSICAL ACTIVITY DURING PREGNANCY

Patricia Kinser, PhD, WHNP-BC, RN, FNAP[1], Christine Aubry, student[2], Saba Masho, MD, DrPH[2]

[1]Virginia Commonwealth University School of Nursing, Richmond, VA; [2]Virginia Commonwealth University, Richmond, VA

Background: Although the CDC recommends that pregnant women participate in physical activity at least five times each week for 30 minutes, not even 16% of pregnant women are engaging at that level. Pregnant women have expressed interest in yoga as a form of low-intensity physical activity and desire a convenient method for accessing yoga. Yoga is safe for pregnancy and is associated with improvements in quality of life, stress and related symptoms (e.g., depression, anxiety), and may be a strategy for increasing physical activity in pregnancy.

Purpose: The purpose of this study is to evaluate the feasibility and acceptability of integrating prenatal yoga into a group prenatal care setting, as informed by patients and providers who participated in combined group prenatal care and prenatal yoga classes (CenteringPregnancy plus Yoga, or “CPC+Y” classes).

Methods: This community-based qualitative study utilized focus groups with pregnant women (*n*=16) who participated in CPC+Y and with healthcare providers who were involved in CPC+Y (*n* = 5). Open-ended questions were used to elicit thoughts, beliefs, attitudes, and concerns regarding the integration of low-intensity physical activity, in the form of prenatal yoga, with group prenatal care. Qualitative data was analyzed through content analysis based on descriptive qualitative methodology with phenomenological overtones in an iterative process.

Results: The following key themes arose from the data: (1) the integration of yoga into group prenatal care provided a convenient way for participants to engage in gentle physical activity; (2) participants experienced decreased stress and enhanced confidence with low-intensity physical activity; and (3) time, space, and partner issues were key barriers to full engagement with the yoga aspect of the group prenatal care meetings.

Conclusions/Implications: Given the imperative by the Institute of Medicine to encourage pregnant women to engage in physical activity and control weight gain, this study is timely and relevant for evaluating whether the incorporation of gentle physical activity, in the form of yoga, into group prenatal care could enhance women’s engagement in physical activity. Standard prenatal care does not currently fully address pregnant women’s low engagement in physical activity, hence the findings from this study may have the potential to impact the way

prenatal care is delivered. The findings from this study are encouraging and will be used to inform the development of future large-scale randomized controlled trials.

EXERCISING FOR TWO: ASSOCIATIONS OF MATERNAL EXERCISE, FETAL GROWTH, & INFANT BIRTH WEIGHT IN WOMEN WITH GESTATIONAL DIABETES

Krista S. Leonard, B.A.[1], Danielle Symons Downs, Ph.D.[2]

[1]The Pennsylvania State University, State College, PA; [2]The Pennsylvania State University, University Park, PA

Exercise (EX) may help women with gestational diabetes mellitus (GDM) to control blood glucose and possibly prevent or delay the onset of insulin. However, little is known about the association between maternal EX and infant growth (i.e., fetal abdominal circumference [AC]; birth weight) despite that EX has the potential to positively impact fetal growth and subsequently lower the risk for macrosomia (i.e., baby weighing more than 4,000 g at birth). **Purpose:** Examine associations between maternal 2nd trimester EX and insulin use, fetal growth (AC [mm] and percentile [%tile]), and infant birth weight among GDM women in a randomized EX intervention. **Methods:** GDM women (*N* = 65) were randomized to either the face-to-face (F2F) EX intervention, home EX intervention, or control group at 20-weeks gestation through delivery. Average steps/day and minutes spent in moderate-vigorous EX/day were measured at 20-weeks gestation with an NL1000 pedometer. AC mm and %tile were measured by ultrasound at 32- and 36-weeks gestation. Insulin use and infant birth weight were obtained from medical records. Of the 65 women, 24 had sufficient data on all of these measures to conduct the analyses. **Results:** Although group differences were not significant, theF2F group was less likely to need insulin compared to the home and control groups. The F2F group initiated insulin use later in gestation (32.83 weeks) compared to the home group (27.75 weeks; $p < .10$); however, there was no difference compared to the control group (32.67 weeks; $p > .10$). Pearson's correlations showed that higher NL1000 steps/day was associated with lower AC %tile at 32- and 36- weeks gestation and AC mm at 36-weeks gestation among the entire sample. Also, higher NL1000 min moderate-vigorous EX was associated with lower AC %tile and mm at 32-weeks gestation and lower infant birth weight. There were no significant individual group correlations. Lastly, while a small proportion (14%) of the overall sample gave birth to infants with macrosomia, twice as many were in the home group compared to the F2F and control groups. **Conclusion:** These preliminary findings suggest that higher maternal EX is associated with lower AC (%tile and mm) and infant birth weight. However, further research is needed to replicate these findings given the small sample size. A F2F EX intervention may help to regulate fetal growth among GDM women and delay the onset of insulin without adverse effects to fetal growth or infant birth weight.

INCREASING PHYSICAL ACTIVITY IN MOTHERS USING MOBILE APPS AND VIDEOCONFERENCE: MOVE TRIAL RESULTS

Maya Mascarenhas, MPH

University of California, San Francisco, San Francisco, CA

Intro: Mothers have lower levels of activity compared to their own levels before children and compared to fathers and women of the same age with no children. They experience unique barriers towards activity including a lack of leisure time, fatigue, childcare needs, and a sense of isolation.

Methods: MOVE (Mothers Online Video Exercise) is an online program designed for mothers with at least one child under the age of 13. Videoconferencing tools (Google Hangouts) were used to create virtual spaces where mothers exercised together using popular mobile apps that guided short intensive workouts.

We enrolled 64 women, 30 of whom were randomized to an 8-week online exercise program that started upon enrollment (intervention) and 34 were randomized to start a group after 8-weeks (waitlist control). Our primary outcome was minutes of moderate and vigorous physical activity (MVPA) measured using the Godin physical activity instrument. Secondary outcomes included weight loss (self-report), physical activity self-efficacy and social support. We compared changes from baseline to 8 weeks between the intervention and control arm using t-tests. Feasibility and acceptability were assessed for intervention participants.

Results: In the intervention arm (n=27 with completed data), women had a baseline MVPA of 65 minutes, which increased by 30 minutes at 8 weeks. In the waitlist arm (n=27 with completed data), women had a baseline MVPA of 68 minutes, which decreased by 4 minutes at 8 weeks. The difference of 39 MVPA (95% CI [-20-99]) in the change in minutes between arms was not significant. Women reported an average baseline weight of 147 pounds in the intervention arm, and 145 in the control arm. After 8 weeks, women in the intervention reported a loss of 2 pounds (95% CI [-4.1-0.27]) compared to a loss of 0.19 pounds in the control arm, a difference that was almost statistically significant (p=0.08).

All participants reported that they would recommend this program to a friend. Women in the intervention arm reported feeling good or great after exercise group sessions, and all reported feeling an increase in their fitness levels. Half the women chose to continue with their group at the conclusion of their 8-week participation. On average, women participated in 3 sessions per week with routines that lasted 15 minutes. The most popular workout apps included Nike+, Sworkit and Johnson & Johnson 7 Minute App.

Discussion: An online exercise intervention proved feasible, and acceptable to mothers. A larger trial with continuous measures of physical activity and fitness measures is warranted to understand if the intervention if effective at increasing activity levels and fitness and whether weight loss can be reproduced and sustained in a new sample.

MERITORIOUS AWARD WINNER

PHYSICAL ACTIVITY AND EXECUTIVE FUNCTION TRAJECTORIES FROM 4TH THROUGH 6TH GRADE: DIFFERENCES BY PHYSICAL ACTIVITY TYPE

Christopher Warren, BA[1], Mary Ann Pentz, PhD, MA[2]

[1]University of Southern California Keck School of Medicine, Los Angeles, CA; [2]University of Southern California, Department of Preventive Medicine, Institute for Health Promotion and Disease Prevention Research, Los Angeles, CA

Background: Multiple studies in the pediatric literature have linked physical activity (PA) to enhanced executive function (EF), which in turn has been linked to improved health, and well-being across the lifespan. While evidence suggests that various forms of PA may differentially impact EF, such work has been limited to acute studies and others limited in their ability to evaluate longitudinal relationships between multiple PA types and EF trajectories across early adolescence. Moreover, extant work has largely studied aerobic exercise paradigms which are not cognitively demanding (e.g. treadmill running, stationary bicycling) and thus may not tap or promote executive functioning to the same degree as other, more cognitively taxing forms of physical activity (e.g. certain sports, martial arts).

Methods: A school-based sample of 709 youth were administered 4 subdomains of the Behavioral Rating Inventory for Executive Function-Self Report scale (inhibitory control, emotional control, working memory, organization of materials), and an abridged Self-Administered Physical Activity Checklist (SAPAC) at four time points from 4th through 6th grade. Growth curve models (GCMs) were fit examining relationships between EF trajectories and each of 12 PA types assessed by the SAPAC adjusting for participant SES, gender, ethnicity, group assignment, school, and total physical activity. Multiple group conditional GCMs were fit to test whether baseline EF or EF slope growth factors differed significantly between students who reported participating in each activity at 4th, 5th, and 6th grade assessments, vs. students who did not. All models demonstrated excellent fit (CFI >.95; RMSEA < .05).

Results: Regular participation in martial arts (N=35) and skating (including ice, roller, and skateboarding) (N=148) were each independently associated with significantly increased EF growth from 4th through 6th grade [B (martial arts participants) =.58; B (non-participants) =.09; chi-squared difference test p < .05] [B (skating participants) =.36 ; B (non-participants)

=.05; chi-squared difference test $p < .05$]. No significant group differences in EF were observed at 4th grade (baseline) between participants and non-participants in either activity. No significant differences in baseline EF or EF trajectories across time were found for the other activities assessed by the SAPAC (i.e. ball playing, bicycling, swimming, gymnastics, exercises like pushups/sit-ups/jumping jacks, team sports, dancing, racket sports, active outdoor games, and active chores.

Conclusions: This study found that only martial arts and skating were associated with EF growth trajectories, whereas other types of PA were not. While previous work has linked martial arts to EF promotion, future research should confirm and further investigate mechanisms through which skating may lead to improved EF from 4th through 6th grade.

POSITIVE PARENTS' PERCEPTIONS OF IMPLEMENTING A PHYSICAL ACTIVITY PROGRAM AT HOME IN YOUNG CHILDREN WITH PRADER-WILLI SYNDROME

Kasen Bras, Undergraduate student[1], Kathleen Wilson, Ph.D.[2], Daniela A. Rubin, Ph.D.[3]

[1]California State University Fullerton/ Cal Poly Pomona, Fullerton, CA; [2]California State University Fullerton, Fullerton, CA; [3]California State University, Fullerton, Fullerton, CA

Prader-Willi Syndrome (PWS) is a rare (1 in 15,000) genetic neurodevelopmental disorder leading to hyperphagia, hypotonia, high adiposity and developmental delay. PWS affects motor skills, communication and behavior. Thus, characteristics of the syndrome pose challenges for children and adults with PWS to being physically active. This study used a multiple case study design to explore parent perceptions of their experience with leading a physical activity intervention with their child at home. Home-based Active Play for Parents and Youth (HAPPY) Early Discoveries is a 12-week active play program facilitated by parents that focuses on improving motor skills in children ages 4 to 7 years old. This multiple-case study included four different parents of children with PWS who completed the HAPPY Early Discoveries program. Each parent participated in an exiting semi-structured interview exploring their experiences with the program and the changes they perceived in their child. The transcriptions of these interviews were analyzed using a hierarchical content analysis to extract common themes. The themes were separated into implementation and outcomes of the program. When implementing the program, major themes described by all parents were the challenges of the program execution and finding the right strategies to motivate their child's participation. The challenges included balancing the program implementation with a busy life and scheduling the program in. The main motivation to do the program, for both parents and children, was the use and appeal of the equipment and activities provided by the program. With regards to the outcomes, major aspects observed by parents were improvements in their child's motor skills (i.e. coordination and muscular strength) and the motivation for physical activity. Parents mentioned their child was motivated by having choices in the program and would initiate some activities on their own incorporating their imagination. Another outcome of the program was the enjoyment experienced by the parents and children as the parents enjoyed the family togetherness and children viewed physical activity as fun. Despite challenges with implementing the program, parents of young children with PWS gave positive feedback about implementing a game-based physical activity program at home.

PREDICTORS OF DAILY PATTERNS OF PHYSICAL ACTIVITY AMONG LATINA PARTICIPANTS IN A PHYSICAL ACTIVITY INTERVENTION

Alexander W. Sokolovsky, MA[1], Shira Dunsiger, PhD[2], Lucas Carr, Ph.D.[3], Bess H. Marcus, Ph.D.[4]

[1]Brown University, Providence, RI; [2]The Miriam Hospital and Brown University, Portsmouth, RI; [3]University of Iowa, Iowa City, IA; [4]University of California, San Diego, La Jolla, CA

Physical activity (PA) interventions based on the Transtheoretical model frequently target behavioral, cognitive, and other psychological factors to move people through a series of stages associated with adoption and maintenance of PA. This study examined long-term daily patterns of PA among adult Latinas enrolled in a 12-month PA intervention.Objective daily PA data was collected using pedometers over 12 months among 122 Spanish speaking Latinas (age *M* = 41.1 years, *SD* = 10.0; baseline BMI *M* = 29.5, *SD* = 4.3; 50.0% married; 45.1% unemployed). We fit a linear mixed effects regression model, regressing PA (i.e. total daily steps) onto demographic variables (partner and employment status), number of young children, day of week, season, baseline depression, days with pedometer, and time-varying predictors including BMI, self-efficacy, stage of change, behavioral and cognitive processes, and social support. Participants averaged 6,603 steps/day. PA was highest during weekdays and summer. PA was significantly negatively associated with days with pedometer, number of young children, and baseline depression; and positively associated with enjoyment, behavioral processes, and stage of change. Neither self-efficacy nor social support significantly predicted PA. We further examined the interaction between self-efficacy and stage of change and results suggest individuals in early stages of change demonstrated a significant negative relationship between self-efficacy and PA relative to the non-significant effects observed among those in more advanced stages of change.Progression through stages of change in this intervention was associated with increased daily PA. The significant interaction between self-efficacy and stage of change indicated that individuals in early stages of change may be more confident in their ability to increase their daily PA relative to those who have begun implementing such changes. Seasonality, weekday, and number of young children all impeded daily PA, the latter being consistent with subjects' self-reports of barriers to engaging in PA. Results suggest that the addition of a daily activity monitors to interventions can provide some insight into how and when specific intervention approaches impact physical activity.

SOCIAL CUES’ INFLUENCE ON THE RELATIONSHIP BETWEEN GOAL-SETTING AND EXERCISE PERFORMANCE

Charles Heidrick, MS, Dan J. Graham, PhD

Colorado State University, Fort Collins, CO

In two previous studies, we identified social factors that influence goal-setting and performance in an exercise context. In study 1, participants were more likely to achieve exercise goals when their goals were affirmed by a researcher than when their goals were kept private or were presented to, but unacknowledged by, a researcher, suggesting that social affirmation can increase task motivation and persistence. In study 2, participants were more likely to set more challenging exercise goals when provided social comparison information; participants in study 2 were randomly assigned to view normative exercise performance data that was accurate, overestimated, or underestimated, and in all three conditions, participants set more challenging exercise performance goals than when no social comparison data were provided. Additionally, being provided with overestimated normative data led participants to set even more challenging goals, leading to improved exercise performance vs. receiving accurate or underestimated normative data. In these studies, social influences exerted prior to beginning a task impacted goal-setting, task motivation, and performance. In the present study, we sought to determine whether the content of these influential communications had the same positive impacts if presented electronically, rather than directly from another person. College students (n = 171) participated in a controlled experiment. A researcher demonstrated four exercises (pushups, planks, jumping jacks, and single-leg balancing), after which participants set personal goals regarding their own imminent performance of these exercises. Participants were randomly assigned to one of two conditions: 1) Goals affirmed: after entering their goals into a computer program, participants received a message of “These goals look great!” or 2) Goals acknowledged: after entering their goals into a computer program, participants received a message of “These goals have been received.” Performance averages on the four exercises were as follows for the Affirmation group: 24.6 consecutive pushups, 78.5 second plank, 70.4 jumping jacks in one minute, and 20.8 second balance. None of these values differed significantly (p-values .21-.70) from the performances by the Acknowledgment group (24.9, 76.1, 68.8, 23.0, respectively). In contrast to the positive social benefits seen in studies 1 and 2, affirmation from a computer had no effect on exercise performance in study 3, suggesting that the social aspect of human affirmation is critical. Implications of these results include the importance of incorporating positive social cues as useful components in promoting motivation and engagement in health

behavior change interventions, and highlight a potential shortcoming in eHealth and mHealth behavioral interventions that are built around online and mobile messaging.

THE ASSOCIATION OF MUNICIPAL OFFICIALS' PARTICIPATION IN PHYSICAL ACTIVITY POLICY AND CITY-LEVEL PHYSICAL ACTIVITY

Kristin Schneider, Ph.D.[1], Daniel Kern, M.S.[2], Jacey Keeney, M.S.[3], Karin Valentine Goins, MPH[4], Stephenie Lemon, PhD[4]

[1]Rosalind Franklin University of Medicine & Science, North Chicago, IL; [2]Rosalind Franklin University of Medicine & Science, Chicago, IL; [3]Rosalind Franklin University of Medicine & Science, Marseilles, IL; [4]University of Massachusetts Medical School, Worcester, MA

Municipal officials' support of physical activity promotion policies is critical to the development of communities that encourage physical activity. We examined whether municipal officials' reported participation in policies to increase physical activity was associated with city-level physical activity. We also examined whether officials' endorsement of greater consideration of physical activity in their work, and their perception of resident support for addressing physical activity in their position, were associated with physical activity. Municipal officials from municipalities with > 50,000 residents in 8 states completed a 2012 survey where they indicated their participation (yes/no) in the development, adoption or implementation of 1) municipal land use policy to increase mixed use, density, street connectivity, or pedestrian or bicycle access; 2) municipal public works or transportation policy to increase pedestrian or bicycle safety; and 3) municipal parks and recreation policy to increase access. They rated their consideration of physical activity in their position and their perception of resident support for physical activity on 5-pt scales. City-level physical activity (% engaging in any leisure-time physical activity) from the 2012 *Behavioral Risk Factor Surveillance System* (BRFSS) was matched to the officials' city. Analyses controlled for officials' job (e.g., mayor, public health official), race/ethnicity, education, city residence, state, use of active transportation, and degree of social and fiscal conservatism/liberalism. Of 453 officials with survey data, 161 (68% male) had BRFSS data. Participation in land use policy was the only policy associated with physical activity [F(1, 144)=5.05, p=.03, η^2=.03]. Officials' perceptions of residents' support for addressing physical activity was associated with physical activity (t=3.65,p2Δ= .05); officials' reported importance of physical activity to their position was not. Officials perceptions of residents' support for addressing physical activity was associated with their participation in land use design policy (r=.17, p=.04). Municipal officials' focus on land use policies that encourage physical activity may be key to increasing physical activity rates. Though counties with greater physical activity participation may appear to be more supportive of physical activity, encouraging residents to voice their support of environmental

changes that increase physical activity potential, might persuade officials to consider physical activity more, and thereby improve public health.

THE ROLE OF ENJOYMENT MODERATES REASONS FOR EXERCISE AND PHYSICAL ACTIVITY

Emily Brooks, B.A.[1], Paige Hildreth, B.A.[2], Afiah Hasnie, BA[2], Heather Fellmeth, MA [2], Caitlin LaGrotte, PsyD, MEd[3], Nataliya Zelikovsky, Ph.D. [4]

[1]LaSalle University, Philadelphia, PA; [2]La Salle University, Philadelphia, PA; [3]Temple University, Philadelphia, PA; [4]Psychology, La Salle University, Philadelphia, PA

Various factors have been found to encourage physical activity (PA) in adults, including exercise enjoyment (EE) and health reasons. Identifying reasons to exercise (RTE) is crucial since only 20.8% of adults in the United States engage in the CDC recommended PA guidelines. Research examining enjoyment as a motivation to exercise have provided mixed results. Individuals underestimate enjoyment before PA and report higher rates of EE after participating in PA. Additionally, previous research has found gender differences in RTE: females are more likely to exercise for physical appearance and males are more likely to exercise for competition and social recognition. Both genders, however, have endorsed health management as an important RTE. Based on the established relationship between RTE and PA, our aim was to determine whether enjoyment moderated this relationship above and beyond gender differences.

Undergraduates (N= 289, 78% female, 61% non-hispanic white, age = 19.7) were surveyed about weekly exercise engagement, personally motivating reasons for exercise and how much they enjoy the reported PA. Regression analyses were conducted for the 14 constructs representing RTE in the Exercise Motivation Inventory. Gender was controlled for based on existing RTE research. Exercise enjoyment was regressed on amount of PA (days per week) and RTE revealing a significant moderation for health related RTE: weight management R2 = .100 (F(2, 286) = .105, $p < .05$), health pressure R2 = ..233 (F(2, 286) = .10, $p < .05$), and avoidance of negative health outcomes R2 = .531 (F(2, 286) = .114, $p < .05$). The results of this study suggest that undergraduates who are motivated to exercise for health related reasons are more likely to exercise when participating in PA that are perceived to be more enjoyable. Since enjoyment moderates PA for health-motivated individuals, future studies should identify types of activities that individuals with health conditions find both feasible and enjoyable to increase exercise compliance.

BARRIERS TO HEALTHCARE ACCESS AND UTILIZATION AMONG US BORN AND IMMIGRANT AFRICAN AMERICANS, AND LATINAS

Uwaila Omokaro, High School Student[1], Mayra Serrano, MPH[2], Kimlin T. Ashing, PhD[2]

[1]City of Hope Summer Intern, Duarte, CA; [2]City of Hope, Duarte, CA

Background: Health disparities exist and persist for preventive health care and screening including cancer. African American (AA) women and Latinas have higher later stage cancer diagnosis and mortality than white women. There is a lack of studies comparing US born and immigrant African Americans and Latinas on this population healthcare access and utilization. This study examines healthcare access and utilization barriers among US and foreign born AA and Latinas.

Methods: We were guided by a community engaged approach. The participants were 395 AA and Latinas from 18-65 years. Participants were recruited passively via fliers and actively at health-fairs and through elementary school mailers. Demographic factors including country of birth, and barriers to Healthcare Access and utilization were assessed

Results: 395 female participants: US born AA (n = 129), foreign born AA (n = 58), US born Latinas (n = 57), and foreign born (n = 151). Less than half (47.1%) reported that they were born in the US. Ages ranged from 18-65 years, and the mean age was 42.8 years (SD = 12.93). Most participants were married or partnered (65%), did not have a college degree (78.2%), and had an annual income below $25K (50%). AA were significantly less likely to be partnered and born outside the US, and more likely to have higher educational attainment than Latinas. AA despite having higher education did not have significantly greater household income.

In general, all groups endorsed moderate to severe barriers to health care access and utilization.Significant group differences in barriers to healthcare access and utilization were observed among the four groups. There were significant group differences in barriers to access to care with respect to “no regular place to go to for care” (medical home) ($p < .001$) and “health insurance coverage” ($p < .001$) with 90.1% and 27.2% of immigrant Latinas reporting no private insurance coverage and no medical home, respectively. Also, there were significant group differences among the four groups in terms of barriers to health care utilization: (1) “wait too long” ($p < .05$); (2) “do not know where to go for medical care” ($p < .01$); (3) “cost” ($p < .05$); (4) “language” ($p < .01$); (5) “navigator” ($p < .05$); and (6) “stress using healthcare” ($p < .01$). Immigrant Latinas reported the greatest barriers, followed by immigrant AA, US born Latinas and US born AA.

Conclusion: Results suggest that barriers to healthcare access and utilization especially among the Latina immigrant population exist as they reported the highest percentage of people who experienced each barrier. Multilevel factors like ethnicity and immigrant status among a group of lower income US born and immigrant population seem to be associated with healthcare access and utilization barriers among the groups studied.

EXAMINING BIOPSYCHOSOCIAL PREDICTORS OF WEIGHT GAIN IN TREATMENT-SEEKING AFRICAN AMERICAN SMOKERS

Marcia McNutt Tan, PhD, MPH[1], Kola Okuyemi, MD, MPH[2], Ken Resnicow, Ph.D.[3], Noella A. Dietz, PhD[4], Michael Antoni, Ph.D.[5], Monica Webb Hooper, PhD[6]

[1]Northwestern University Feinberg School of Medicine, Chicago, IL; [2]University of Minnesota, Minneapolis, MN; [3]University of Michigan, Ann Arbor, MI; [4]Broward Health Systems, Ft. Lauderdale, FL; [5]University of Miami, Coral Gables, FL; [6]Case Comprehensive Cancer Center, Case Western Reserve University, Cleveland, OH

Research has shown that African Americans gain excessive weight after smoking cessation. Yet, African Americans have been underrepresented in post-cessation weight gain research. Few studies have examined 1) the pattern of weight gain and 2) factors associated with weight gain among African American smokers. The current study aimed to examine biopsychosocial predictors of weight gain in a sample of treatment-seekers.

Data were drawn from a randomized controlled trial testing the efficacy of a culturally specific cognitive behavioral therapy (CBT) smoking cessation intervention among African Americans. Participants (N=342) completed assessments at baseline, the end of counseling, 3-, 6-, and 12-month follow ups. Baseline measures were salivary cortisol, depressive symptoms, and weight concern. Weight and self-reported smoking status were measured at all assessments. Random effects multilevel modeling was used to examine the pattern and predictors of weight gain over twelve months post CBT. Smoking status was included as a time-varying variable on level 1, and effects of the biopsychosocial variables were examined on level 2. Cross-level interactions of the biopsychosocial variables and smoking status on weight were explored.

Results revealed that weight significantly increased among those who remained abstinent over twelve months post CBT. Controlling for intervention condition and baseline obesity, smoking status positively predicted weight gain in the full sample; abstinence was associated with increased weight. In a multivariate analysis, male sex and weight concern were positively associated with baseline weight. Furthermore, exploratory analysis revealed that depressive symptoms moderated the association between smoking status and weight.

In this sample of African American smokers, weight gain was comparable to previous post-cessation weight gain research. We also found that psychosocial factors emerged as important in predicting weight gain. Future research examining predictors of weight gain will

inform smoking cessation interventions and help elucidate factors that contribute to tobacco- and obesity-related health disparities.

EXPLORING MUSLIM WOMEN'S USE OF CONTRACEPTIONS: PRELIMINARY FINDINGS OF A SAMPLE SURVEY CONDUCTED IN THE UNITED STATES

Henna Budhwani, PhD, MPH, Kristine Ria. Hearld, PhD

University of Alabama at Birmingham, Birmingham, AL

Introduction: Studies on American, Muslim women are limited, and little is known about their reproductive health. However, studies on contraception utilization in the general public have found that socioeconomic and cultural barriers are associated with limited contraceptive utilization, and the method of contraception used varies significantly when considering demographics, ethnicity, and marital status. Specifically, 62-75% of American women aged 15-44 used some form of contraception with oral contraceptive pills being the most popular. Racial and ethnic minorities areless likely to use contraception and tend to use lower-efficacy methods more frequently than non-minority, American women. Consequently, racial and ethnic minorities are twice as likely to experience an unintended pregnancy compared to non-minority women in the United States. Considering this knowledge gap, the aim of this study was to explore American, Muslim women's utilization of contraception in general, oral contraceptive pills, and condoms.

Methods: Self-reported data were collected through an online portal in late 2015 and were analyzed in 2016. Women who identified as Muslim, were at least eighteen years old, were sexually active, and were current residents of the United States (N=274) met the inclusion criteria. Chi-square tests and t-tests were used to assess associations between demographic characteristics, socioeconomic status, religious characteristics, use of contraception, and type of contraception.

Results: American, Muslim women utilized contraception at a similar rate found in American women, in general. Respondents identifying as Sunni Muslims had lower utilization. Ethnicity was associated with contraception utilization; Middle Eastern or North African Muslims had lower utilization of oral contraceptive pills and condoms.

Discussion: Findings suggest American, Muslim women's contraception utilization patterns are complex. Although general contraceptive utilization was high, Muslim sub-groups' utilization of oral contraceptive pills and condoms varied. These disparities may reflect cultural preferences, knowledge of contraceptive options, or even differences in health care access. These preliminary findings serve as a foundation for health disparities researchers and public health practitioners seeking to better understand health behaviors of American, Muslim

women. Additionally, although online data collection tools are viewed with some trepidation, this tool did enable us to reach this particularly stigmatized and hard-to-reach population.

RACIAL DISPARITIES IN HEALTHCARE-PROVIDER ADVICE TO QUIT SMOKING

Hope Landrine, PhD[1], Irma Corral, PhD[2], Jukelia Bess, BS[1], Marla Hall, PhD[3], Kelly Reburn, B.A.[2], Gavin Locklear, Bachelors [4], Elizabeth Milton, Bachelors [5], Jimmy T. Efird, PhD[1]

[1]Center for Health Disparities ECU, Greenville, NC; [2]East Carolina University, Greenville, NC; [3]Brody School of Medicine, East Carolina University, Greenville, NC; [4]East Carolina University Center for Health Disparities, Greenville, NC; [5]Center For Health Disparities, Greenville, NC

African-Americans (AAs) have a higher prevalence of smoking-related diseases than Whites even though they smoke fewer cigarettes. This is in part because AAs are significantly less likely than Whites to quit smoking. Being advised to quit by a healthcare provider (HCP) is a robust predictor of smoking cessation, but AAs are significantly less likely than Whites to receive such advice. Health insurance, regular doctor, age, gender and education are the five major predictors of HCP cessation advice (HCP-CA) but do not explain racial disparities in it. We examined other variables that also may contribute to racial disparities in HCP-CA. Specifically, we included the major correlates of race and examined their effect on the contribution of race to HCP-CA. Our random, southern sample of 1670 AA and White adults included 512 smokers, and no racial difference in smoking prevalence (Whites = 32.7%, AAs = 31.7%; $X^2 = 0.130$, $p = .718$). A significantly larger percentage of White (74%) than AA (55%) smokers had ever-received HCP-CA ($X^2 = 13.869$, $p = .0005$). The first hierarchical logistic regression included the 5 major predictors (above) and race entered on the last step. Health insurance and education were not significant, but age (older), regular doctor (yes), and gender (woman) increased the odds of HCP-CA. After controlling for those 5 variables, Whites remained (Odds Ratio [OR]) 2.6 times more likely than AAs to receive HCP-CA. An additional logistic regression included co-morbidities (hypertension, diabetes, obesity) and religiosity (both strong correlates of being AA), with race again entered on the last step. Adding these variables improved model fit (Cox & Snell R^2) but *increased (rather than decreased) racial disparities* in HCP-CA: After controlling for all of these variables, Whites were (OR) 9.3 times more likely than AAs to receive HCP-CA. These data suggest that AAs who have comorbidities receive HCP-CA less often than Whites but do indeed receive it, whereas AAs who lack comorbidities are extremely unlikely to ever receive HCP-CA. Chi-square analyses of the AA smokers supported this interpretation, and thereby highlight the need to improve HCP compliance with federal policies requiring them to assess and treat tobacco use.

SHOP-BASED HEALTH PROGRAM PLANNING: PERCEPTIONS AMONG RURAL OWNERS USING A FORMATIVE RESEARCH APPROACH

Marla B. Hall, PhD[1], Jukelia Bess, BS[2], Hope Landrine, PhD[2], Irma Corral, PhD[1], Jimmy T. Efird, PhD[2]

[1]East Carolina University, Greenville, NC; [2]Center for Health Disparities ECU, Greenville, NC

African American barbershops and beauty salons are settings that have been identified as a significant and culturally relevant venue to reach minority populations for health promotion activities. By being located in almost every town in the United States, this setting is a viable means to promote healthy lifestyles among African Americans. The purpose of this formative research project was to assess African American barbershop and beauty salon owners' perceptions of providing health promotion programming in their shops, as well as to obtain information on health topics of interest and strategies for implementation. Interviewees were recruited using snowballing among clientele and owner referrals, between November 2014 and August 2015. A total of 20 barbershop and salon owners, across 11 counties in eastern North Carolina, completed face-to-face interviews. Responses were stratified by barbershops and beauty salons. Across both groups, all owners stated it would be a good idea to have health programs/interventions within the shop setting. Most noted topics of interest included diet and nutrition, hypertension and (wo)men's reproductive health. When asked further about these desired topics, both benefits and relevance to customers and the African American community were the reasons for their selections. In addition, across barbershops and salons, 90% of owners stated interest in having a program implemented in their shop. This information will be used to guide the development of shop-based interventions, with the aid of a community advisory board composed of shop owners, individual barbers and stylists; and customers.

STRIKING NATIONAL-LEVEL DISPARITIES IN LGB TOBACCO USE

Kristen Emory, PhD[1], Dennis Trinidad, PhD[2]

[1]Moores Cancer Center at University of California, San Diego & San Diego State University, San Diego, CA; [2]Moores Cancer Center at University of California, San Diego & San Diego State University, La Jolla, CA

Purpose: Despite recent increases in attention to lesbian, gay, bisexual and transgender (LGBT) issues, tobacco use among racial/ethnic LGBT populations remains understudied, particularly in large nationally representative samples. This study seeks to address this issue by exploring and identifying patterns in tobacco use across diverse LGB populations.

Methods: We utilized public use data from the Population Assessment of Tobacco Health (PATH), a nationally representative US sample of adults ages 18+ (N=31,081), exploring for differences in tobacco use across self-reported sexual orientation, including 29,369 heterosexual/straight and 1,712 lesbian, gay or bisexual (LGB) respondents. We explore past 30 day use of cigarettes and e-cigarettes. Race/ethnicity was dichotomized to Non-Hispanic white (NHW) and racial/ethnic minorities (People of Color – POC) due to sample size limitations. We report basic descriptive data and adjusted logistic regression.

Results: Past 30-day use of both cigarettes and e-cigarettes was higher among LGB participants (15.8% and 52.9%, respectively) compared to non-LGB participants (11.8% and 34.8%, respectively). Racial/ethnic differences were observed in past 30-day use of cigarettes and e-cigarettes among LGB and heterosexual/straight populations in both the unadjusted and adjusted analysis. White LGB (OR=1.2, 95%CI:1.0-1.5), Heterosexual POC (OR=1.8, 95%CI:1.7-2.0), and LGB POC (OR=2.5, 95%CI:2.1-3.0) reported higher odds of past 30-day cigarette use, compared to NHW heterosexual participants. Similarly NHW (OR=2.0, 95%CI:1.7-2.2) and POC (OR=1.2, 95%CI:1.0-1.4). LGB had higher odds of past 30-day e-cigarette use, when compared to NHW heterosexuals; while heterosexual POC had lower odds (OR=0.7, 95%CI:0.6-0.7).

Conclusions: These striking differences in tobacco use across race/ethnicity and sexual orientation groups suggest there may be within population disparities in the risk for tobacco among diverse LGB populations. This preliminary evidence supports the idea that being a member of a multiple minority group (e.g. both a racial/ethnic minority and sexual minority) may play an important role in tobacco use among diverse LGB. Further research on the role of multiple minority stress is needed to examine this relationship with diverse LGB tobacco use.

THE LIVED EXPERIENCE OF INFORMAL AFRICAN AMERICAN CAREGIVERS OF FAMILY MEMBERS WITH ALZHEIMER’S DISEASE AND RELATED DEMENTIA

Dell G. Mars, PhD, RN

Southeastern Louisiana University, Baton Rouge, LA

The aim of this study was to explore the lived experience of informal African American (AA) caregivers of family members with Alzheimer’s Disease and Related Dementias (ADRD). A descriptive phenomenological study was used to conduct semi-structured interviews with 16 AA informal caregivers in Southeastern United States. Data was collected during the months of September 2014 to November 2014. The descriptive phenomenology ofHusserl and the methodological interpretations of Colaizzi’s method of analysis underpin this study. Four themes were identified in this analysis: (a) sense of obligation, (b) arduous journey, (c) sentinel events, and (d) faith in God. Results of this study suggest that informal caregivers lack support, knowledge, and guidance.

CONDOM CARNIVAL EVALUATION: COMPARISON OF A NOVEL SEXUAL RISK REDUCTION INTERVENTION TO "BUSINESS AS USUAL" AND A GOLD STANDARD

Mollie B. Anderson, PhD[1], Idia B. Thurston, PhD[2], Theresa Montgomery. Okwumabua, Ph.D.[1]

[1]The University of Memphis, Memphis, TN; [2]University of Memphis, Memphis, TN

College students frequently report not using condoms, placing them at risk for unplanned pregnancy and sexually transmitted infections, including HIV. This study aimed to investigate the preliminary efficacy, acceptability, and feasibility of The Condom Carnival, a novel, brief, interactive, culturally-tailored, and peer-led sexual risk reduction group intervention for college students. A longitudinal, randomized controlled trial was utilized to compare the efficacy of the Condom Carnival to an education-only control condition (HIV/STI 101) and a treatment control condition (VOICES/VOCES, a CDC effective behavioral intervention). To encourage college students to increase their condom use and lower their sexual risk, the Condom Carnival has three specific aims: 1) address knowledge deficits in sexual health information, 2) improve condom-related self-efficacy, and 3) increase awareness of risky sexual behaviors. Due to the interactive, skills-based, and peer-led nature of the Condom Carnival, we hypothesized that participants would report greater efficacy and acceptability of the Condom Carnival compared to the other interventions. Undergraduate and graduate students were trained as Condom Carnival peer-facilitators.119 undergraduates, aged 18-57 years (*M*=21.8), were recruited for this study. Students were 77% Female, 52% Black, 42% White, 6% Latino, and 1% Asian. All questionnaires (pre-, post-, and follow-up) were administered online. Two-way Mixed ANOVAs, McNemar’s tests, and a One-way ANOVA were used to examine the interventions’ comparative efficacy and acceptability; frequencies were examined to determine the feasibility of Condom Carnival activities. The Condom Carnival had equivalent acceptability and efficacy as VOICES/VOCES in teaching sexual health information (HIV and lubricant safety knowledge), improving facets of condom-related self-efficacy (condom negotiation strategies and correct condom use skills), and increasing awareness of risky sexual behaviors (lowering number of sexual partners, decreasing general sexual risk, and increasing safe sex behaviors). All Condom Carnival participants engaged in every activity, thus displaying excellent feasibility. The Condom Carnival, with its scalability, has utility for teaching college students sexual risk reduction and condom use promotion. This study is promising for intervention researchers, community preventionists, and campus service providers.

HIGH PREVALENCE OF OVER THE COUNTER SLEEP AID USE AMONG INDIVIDUALS WHO HAVE EXPERIENCED INVOLUNTARY JOB LOSS

Patricia Haynes, PhD[1], Graciela E. Silva, PhD[2], Devan Gengler, B.S.[1], Darlynn Rojo-Wissar, BA[1], Uma Nair, PhD[1], Rachel Oliver, N/A[1], David Glickenstein, PhD[1], Duane Sherrill, PhD[1], Stuart Quan, MD[3]

[1]University of Arizona, Tucson, AZ; [2]College of Nursing / University of Arizona, Tucson, AZ; [3]Harvard Medical School, University of Arizona, Tucson, AZ

Sleep is a barometer of mental and physical health, highly influenced by environmental demands. Stressful life events, such as job loss, are thought to precipitate insomnia. Few studies have directly examined sleep or treatment patterns for disrupted sleep after stressful events. As part of recruitment for an ongoing, large-scale, prospective study examining sleep and involuntary job loss, we sent flyers and conducted phone screens with individuals applying for unemployment insurance through the Arizona Department of Economic Security. A total of 399 individuals reporting involuntary job loss called the study line and participated in the initial phone screen (M age = 41.69 years, SD = 11.68 years). On average, callers lost their job approximately 39.60 days previously (SD = 53.86 days). A significant number of callers (29%, n = 116) reported having recently taken drugs or medications to help them sleep or relax. Of these callers, the majority reported using only one drug/medication for sleep (90%, n = 104). The most frequently used drug or medication class was over the counter (OTC) sleep or anti-inflammatory medications (8%), followed by marijuana (6%), and melatonin (3%). Twelve percent of the sample (n = 48) reported taking prescription medications for sleep (3% tricyclic antidepressants, 3% pain medications, 3% benzodiazepines, 2% hypnotics, 1% antipsychotics/other). Only one individual reported recently engaging in Cognitive Behavioral Therapy for Insomnia, the gold standard behavioral treatment for insomnia. Overall, these findings suggest that a significant portion of individuals experiencing job loss independently seek treatment for sleep symptoms and often via OTC sleep medication and marijuana use. Future studies are recommended to investigate barriers to accessing evidence based sleep care and potential side effects of OTC sleep aids among people who have lost their jobs.

THE SCENT OF A GOOD NIGHT’S SLEEP: OLFACTORY CUES OF A ROMANTIC PARTNER INCREASE SLEEP EFFICIENCY

Marlise Hofer, Masters in Psychology, Frances Chen, Psychology PhD

University of British Columbia, Vancouver, BC, Canada

Sleep deficits are widespread and lead to a variety of negative health outcomes. We present novel evidence for the effectiveness of a practical and easy-to-implement strategy for increasing sleep efficiency. Forty women slept with a shirt which had been previously worn by their romantic partner for two nights, and an unworn shirt for two nights. Participants’ sleep efficiency was measured each night using an actigraphy watch, and their perceived sleep quality was measured each morning via self-report. Exposure to a romantic partner’s scent increased women’s sleep efficiency by an average of 6.9%, equating to over 24 minutes per night, or almost 3 hours a week. This effect size is larger than the effect size reported for melatonin, and similar to the effect size reported for benzodiazepines. The effect did not appear in perceptions of sleep quality, and emerged among people who were not aware they were sleeping with their partner’s scent, indicating that this phenomenon occurs outside of conscious awareness. These findings suggest that human scent may be an under-examined but powerful means through which cues to a loved one can exert positive effects even during periods of physical separation.

A QUALITATIVE ASSESSMENT OF BARRIERS TO ADEQUATE HEALTHCARE AMONG MEN WHO HAVE SEX WITH MEN RESIDING IN RURAL AREAS

Danielle N. Lambert, MPH, CHES[1], Natalia Truszczynski, MPH[2], Anne Marie Schipani-McLaughlin, MPH[2], Carolyn Lauckner, PhD[2], Nathan Hansen, PhD[2]

[1]University of Georgia, Atlanta, GA; [2]University of Georgia, Athens, GA

Background: Men who have sex with men (MSM) are most affected by the HIV epidemic in the United States, accounting for 63% of all new infections. Although research has historically demonstrated that rural areas have significantly more barriers to HIV testing and treatment, little is known about the impact of rural residence on MSM's sexual health and access to care. The current qualitative study aimed to explore barriers to adequate healthcare among MSM in rural areas of the United States.

Methods: A total of 20 semi-structured qualitative interviews were conducted from July 2015 to June 2016 with respondents ranging in age from 18 to 60 years. Eligibility criteria included identifying as a man who dates or has sex with other men, residing in a non-metropolitan area of the United States, and being at least 18 years of age. The interviews were transcribed verbatim and coded by a diverse coding team for emerging themes based on Grounded Theory using NVivo 11.

Results: Respondents repeatedly discussed limited resources, distance, provider knowledge, and stigma as barriers to healthcare in the rural areas where they reside. For many respondents, barriers to healthcare impeded access to needed sexual education, testing, and PrEP. Often, they turned to the Internet, peers, or sexual partners for health information, which were not always accurate sources of information. Not only did respondents speak to the inadequate number of clinics and providers within driving distance, but they also described how their insurance failed to cover all the local providers in-network. Respondents living in small towns with only one provider, who they described as closely connected with residents in the area, feared seeking care or openly communicating with this provider due to stigma and a perceived lack of confidentiality. For respondents who were able to access care and disclose their sexual orientation, many recounted negative experiences in which providers said they were not able to answer their questions, that LGBTQ individuals was not their "specialty," or as one respondent described, "it got weird so [they] referred me to someone else."

Conclusions: The findings from this study can aid in creating tailored programming to increase the accessibility of care, improve provider knowledge, and decrease discrimination. Respondents provided recommendations for creating more inclusive clinical environments and ways to improve provider communication to increase the quality of healthcare.

“A GOOD RESULT”: COLORECTAL CANCER SCREENING AND NARRATIVES OF RISK IN A PHOTOGRAPHIC RESEARCH PROJECT

Robert J. Gallo, MD Candidate[1], Jean Hunleth, PhD, MPH[1], Emily Steinmetz, PhD[2], Aimee James, PhD, MPH[3]

[1]Washington University School of Medicine, Saint Louis, MO; [2]Antioch College, Yellow Springs, OH; [3]Division of Public Health Sciences, Washington University School of Medicine, Saint Louis, MO

Cancer screening rates have been increasing, with positive impacts on mortality for several types of cancer. While screening is generally thought of as a healthy behavior, there has been some study of the overall effects of breast cancer screening on women’s lives and understandings of their identities. In comparison to breast cancer, there are fewer analyses of how people make meaning from their colon cancer screening experiences. There are also few studies of how people who face resource shortages and healthcare disparities experience and interpret cancer screening when cancer is not found. Of particular interest is consideration of how people who have had a colonoscopy and who do not have colon cancer conceptualize risk and how that influences their health beliefs.

For this study, 18 participants across three groups were recruited for a Photovoice study that involved a combination of photo-elicitation, individual interviews, and group sessions. Eligible participants had completed CRC screening and had not been diagnosed with colon cancer. The sessions followed a format in which people presented a photo of their choosing, frequently offering a personal story that they related to the photo. All group and individual sessions were audio-recorded and professionally transcribed and uploaded into NVivo 10. Transcripts from the group sessions were analyzed using narrative analysis techniques (Reissman 1993, 2008).

Most of the participants described colon cancer screening as a life-saving intervention, and they were eager to learn more about colon cancer and its prevention both for themselves and to share with their communities. This optimistic picture was complicated though by many of the narratives that they shared. One participant was reluctant to become reliant on medicine due to concerns about financial stability. The colonoscopy could come back with a cancer diagnosis that she may not be able to afford in the future. Others recounted ambiguity over the findings of the screening despite not receiving a cancer diagnosis. Several participants shared narratives in which their concern about their cancer risk was clearly evident, a concern that extended to their friends and family as well.

While the participants where all ‘healthy’ in the sense that their screening colonoscopy did not show colorectal cancer, this analysis demonstrates that colonoscopy took on meaning and had consequences outside the clinic and within other health experiences. These consequences varied among individuals, but the participants highlighted the multitude of ways that even an effective, life-saving intervention can be experienced by a patient. Ultimately, this study speaks to the need to understand the contextual factors and experiences that shape people’s decisions to receive cancer screening and the meaning that such screening has in their lives, even when cancer is not found.

DEVELOPING NEED INDICES TO UNDERSTAND AND ADDRESS SOCIAL DETERMINANTS OF HEALTH

Rachel Barth, MSW, Nikole Lobb Dougherty, MA, Emily Kryzer, MSW, MPH, Jasmine L. Williams, MPH, Jason Purnell, PhD, MPH

Washington University in St. Louis, St. Louis, MO

Background: Social determinants of health—including such factors as poverty, education, and neighborhood quality—have the greatest impact on the health and well-being of individuals. Evidence suggests that investing in strategies that improve equity in social conditions is essential to reducing community health disparities and supporting individual health behaviors. For example, there is evidence that financial assets like child development accounts is associated with better development for children and lower levels of depressive symptoms for mothers. Similarly, protecting fair housing policy ensures equitable access to safe neighborhoods, thus promoting healthy lifestyles.

For the Sake of All, a report and multi-disciplinary project on the health and well-being of African Americans in St. Louis, highlights how various social and economic factors impact regional disparities and supports cross-sector strategies to address disparities.

Methods: Eight cross-sector work groups convened to address the six areas of recommendation highlighted in the report. Over 100 stakeholders and community members identified a need for using community-level data to better understand and prioritize where policy and programmatic efforts should focus. Four of eight individual work groups pursued the development of recommendation-specific need indices.

Results: Following national methodological examples, three different need indices have been developed and used to answer prioritization questions in the following areas related to social determinants of health: 1) A ranking based on birth rates, child poverty rates, and college completion by zip code was developed for child development accounts; 2) a ranking based on area socioeconomic status, health, and social support indicators was developed to determine need for school-based clinics; 3) and an analysis of zoning and land use among St. Louis metro municipalities revealed areas of opportunity for improving access to inclusive, affordable housing. These are being used by work groups to prioritize programmatic and advocacy efforts to improve community health.

Discussion/Conclusion: The use of work group expertise to guide the development and application of community-level need indices offers a framework by which other communities may work collaboratively to prioritize regional efforts to reduce disparities. This framework is particularly useful within the resource-limited and politically-complex environment of public health research.

ETHNIC AND GENDER DIFFERENCES IN PERCEIVED SOCIAL SUPPORT DURING EMERGENCY ROOM EVALUATION FOR ACUTE CORONARY SYNDROME

Gabriel Sanchez, B.A.[1], Deanna Zhu, B.A.[1], David Lopez Veneros, M.A.[1], Redeana Umland, M.A.[1], Donald Edmondson, PhD, MPH[2]

[1]Center for Behavioral Cardiovascular Health, Columbia University Medical Center, New York, NY; [2]Columbia University Medical Center, New York, NY

Background: Emergency department (ED) evaluation for acute coronary syndrome (ACS; myocardial infarction, unstable angina) is common and highly stressful. Social support is important for ACS outcomes. Hispanic or Latino (HL) patients report more perceived social support than other ethnicities, but no study has assessed ethnicity and gender effects on perceived social support during life-threatening medical situations.
Methods: Within a 3 day median of ED ACS evaluation, 508 participants (age 61±1; 33.3% HL women, 17.7% non-HL women, 24.8% HL men, 24.2% non-HL men) reported the degree to which the social support provider present with them during ED evaluation was “responsive to your needs” and “able to comfort you” [scored from 1 (“none”) to 5 (“all of the time”)]. Analysis of covariance tested the influence of gender, ethnicity and gender*ethnicity on responses (covariates:age, race, Charlson Comorbidity Index, GRACE Risk Score).
Results: There was a significant interaction between gender and ethnicity on perceived responsiveness, F(1,499)=4.12, p=.043, ηp2 =.008. There were no main effects for gender (p =.962) or ethnicity (p =.146). HL men reported their support provider was more responsive (M=4.90, SE=.050) than HL women (M=4.80, SE=.045), non-HL women (M =4.82, SE=.063) and non-HL men (M=4.72, SE=.051). There was a significant main effect of ethnicity on providers’ ability to comfort patients F(1,497) = 4.03, p=.014, ηp2=.012 [gender (p=.773) gender*ethnicity (p=.091)]. HL patients reported more received comfort (M=4.74, SE=.05) than non-HL patients (M=4.53, SE=.062). Though not statistically significant, HL men reported more received comfort (M=4.81, SE=.073) than non-HL men (M=4.48, SE=.076). HL women reported feeling comforted slightly more (M=4.66, SE=.066) than non-HL women (M=4.58, SE=.094).
Conclusion: HL men reported the most social support received while in the ER, followed by both HL and non-HL women, then non-HL men. Prior studies suggest more social support may improve health outcomes. These are the first data to address gender and ethnic differences in received support during life-threatening medical events.

FIRST GENERATION COLLEGE STUDENT STATUS, ACCULTURATION STRESS, AND PSYCHOSOCIAL RESOURCES PREDICT ANXIETY AND DEPRESSION

Katherine Saxton, MPH, PhD, Mariam Khan, BS, Morgan Vien, N/A

Santa Clara University, Santa Clara, CA

Background: Mental health of college students is an important public health concern. College students in the US report high levels of stress, anxiety, and depression, which may lead to decreased academic performance and quality of life. First generation college students may experience increased risk, due to lack of academic and social support. We examined the prevalence of depression and anxiety in college students, risks associated with first generation college student status, and potential psychosocial mediators.

Methods: Students at a Northern California university (n=967) completed a survey, including: a demographic questionnaire, measures of self-efficacy, social support, acculturation stress, subjective social status, and parent/guardian relationship quality, as well as depression (PHQ-9) and anxiety (GAD-7) screening measures. The sample included 28% first generation, 65% female, and 40% non-white college students. Data were analyzed using T-tests and hierarchical linear regression. Depression and anxiety scores were square-root transformed to meet regression assumptions.

Results: 25% of students reported moderate or more severe depression, and 27% of students reported at least moderate levels of anxiety. Women reported more severe symptoms of both anxiety (T=3.42, df=912, $p < 0.001$) and depression (T=2.23, df=922, $p < 0.05$) than men. After adjusting for race and sex, first generation college students reported increased symptoms of depression and anxiety (p’s < 0.01) relative to continuing generation students. However, this effect was fully mediated by acculturation stress (p’s < 0.001) for both outcomes. In the fully adjusted model, self-efficacy, social support, and parental caring were inversely associated with depression and anxiety symptoms (p’s < 0.05). Subjective social status was inversely associated with anxiety ($p < 0.05$), while overprotective parenting was positively correlated with depression ($p < 0.05$).

Conclusions: First generation college students are at increased risk of anxiety and depression, due to acculturation stress. Interventions should increase support for first generation college students, and promote coping strategies, enhance social support, and increase access to mental health resources for all students.

IN THEIR OWN WORDS: THE IMPACT OF STRESS ON CHRONIC DISEASE RISK FACTORS AMONG AFRICAN-AMERICAN CHILDCARE WORKERS

Kia Davis, ScD, MPH[1], Laura Linnan, ScD[2]

[1]UNC-Chapel Hill, Durham, NC; [2]UNC-CH, Chapel Hill, NC

Background: Stress, a potential mechanism explaining racial/ethnic and socioeconomic disparities in health, is socially patterned in the U.S. such that people of color, particularly African-Americans, and those of low SES are likely to experience more stressors. Yet, little attention is given to what stressors these groups experience and how these experiences impact their health risk factors like smoking status or physical activity. The purpose of this study is to quantitatively assess different sources of stress and health risk among African-American women who work in childcare, a low-wage industry and qualitatively include their perceptions of stress and its health impact.

Methods: This was amixed methodspilot studyconducted across 15 childcare centers in North Carolina during June 2016. Women (n=120) were surveyed about stress (job, financial strain, perceived stress, etc.) and mental and physical health. Descriptive, bivariate, and regression analyses were conducted in SAS. A subset of the women (n=38) also participated in semi-structured interviews that covered: identifying various sources of stress they experience; their greatest source of stress; how stress impacts their health, and recommendations for policymakers to reduce the amount of stress they experience. Transcribed interviews were analyzed using a deductive and inductive approach.

Results: Results suggest that reported perceived stress are low. Also, while women discuss financial strain as a major source of stress in interviews; only 15% report “not having enough to make ends meet” yet 43% reported having to borrow money from friends/family. Only 8% report being current smokers. Similarly from interviews, women discuss how experiencing multiple stressors leads to unhealthy eating, headaches, disrupted sleep, and high blood pressure, but also walking with friends to reduce stress. They also articulate that making more money will help reduce the stress they experience in all domains.

Conclusions/Lessons learned: Stress could trigger participation in health enhancing or damaging behaviors as a form of coping. Overall, addressing fundamental causes of stressors could reduce the disproportionate burden of health risk factors among African-American women. However, researchers should consider the meaning of the stress measures they use in order to adequately capture the reality of the communities they survey.

PATHWAYS TO HARM: ALCOHOL USE PATTERNS BY SEXUAL ORIENTATION

Alyssa Norris, M.A.[1], David Marcus, Ph.D.[2]

[1]Brown University, Providence, RI; [2]Washington State University, Pullman, WA

Although lesbian, bisexual, and questioning individuals are more likely to experience negative consequences from alcohol use than heterosexual individuals, they also tend to use alcohol in greater amounts. Researchers have not examined whether substance use is associated with more harmful outcomes controlling for level of use. Using the American College Health Associations' National College Health Assessment (N = 43,252), the present study examined whether sexual identity moderated the relationship between frequency of alcohol use and alcohol-related negative consequences. Consistent with existing literature, lesbian and bisexual women were more likely to use alcohol than heterosexual women, although the pattern of alcohol use was more variable for men. Sexual identity moderated the pathway from alcohol use frequency to alcohol-related harm. Bisexual women and individuals who were unsure of their sexual identity had stronger associations between use and harm compared to their heterosexual peers. A lesbian identity appeared to protect students from harm.

PERSONALITY TRAIT INTERACTIONS AND SUBJECTIVE WELL-BEING THROUGHOUT THE LIFESPAN

Katherine A. Duggan, PhD[1], Chandra A. Reynolds, PhD[2], Howard S. Friedman, PhD[2]

[1]University of Pittsburgh, Pittsburgh, PA; [2]University of California, Riverside, Riverside, CA

High conscientiousness is related to decreased mortality risk, in part because of salubrious health behaviors and healthy social support networks. High neuroticism is associated with decreased subjective well-being and poorer self-rated health, but there is dispute as to whether this reflects actual health problems or heightened sensitivity to somatic symptoms without a true increase in measurable disease. Combinations of conscientiousness and neuroticism, however, have received relatively little attention, and no study has examined associations between these combinations and well-being. Here, we tested the concept of "healthy neuroticism" (Friedman, 2000), which proposes that the vigilance associated with neuroticism is health protective when combined with the responsibility and persistence associated with conscientiousness. Participants were from the Terman study, following 1528 gifted children since 1921. Multiple regressions examined whether "healthy neuroticism" (modeled via simple linear interactions and multiplicative linear spline terms) in adulthood (1940) was related to multifactorial well-being (1940-1950), including measures of self-rated physical health, self- and observer-rated mental health, living up to potential, extent enjoying social relationships, and satisfaction with life.

For men, linear interactions were found for extent enjoying social relationships (B=-0.50, p=.01), such that men high in conscientiousness and neuroticism reported less enjoyment of social relationships. Spline interactions were found for self-rated health for men (B=-0.62, p=.01), observer-rated mental-adjustment (B=-0.44, p=.009), and satisfaction with life (B=-1.28, p=.05), such that men high in conscientiousness and neuroticism scored lower on these variables. For females, the only significant interaction was the spline for living up to potential (B=-1.69, p=.006), such that women high in conscientiousness and neuroticism reported feeling less likely to have lived up to their potential. Consistent with distinctions between subjective and objective health, the results suggest that "healthy neuroticism" is not predictive of a sense of well-being, particularly for men. These results have implications for understanding the associations between personality and well-being, as contrasted with mortality risk.

SELF-EFFICACY AND AFFECTIVE EVALUATIONS: PARALLEL MEDIATING EFFECTS ON WEIGHT LOSS SUCCESS

Sean Rice, BS[1], Jordan Vossen, BS[2], Joyce Ehrlinger, PhD[2], Renee E. Magnan, PhD[3]

[1]Washington State University, Vancouver, WA; [2]Washington State University, Pullman, WA; [3]Washington State University Vancouver, Vancouver, WA

Both self-efficacy and affect consistently influence weight loss success. Less is known about how weight loss may affect self-efficacy and affect, or how these variables may have reciprocal deterministic relationships with each other. We expected successfully losing weight would promote feelings of self-efficacy and positive affect and, together, these factors would lead to continued progress towards weight loss goals. In each of 8 weekly meetings within a structured weight loss program, participants (N=51) were weighed, and they reported their confidence in achieving their goal weight and their affective evaluations of their progress towards that goal. Statistical analyses were conducted using structural equation modeling with maximum likelihood estimation. Cumulative weight loss by the program midpoint significantly predicted midpoint positive affective evaluations (b =.26, SE=.13, p=.047). Affect then predicted weight loss at the end of the program (b =.59, SE = .14, $p < .001$). The results revealed an indirect effect of midpoint weight loss on weight loss at the end of the program, through positive affective evaluations of goal progress, b =.15, 95% CI [.01, .43]. This suggests that greater weight loss predicted greater positive affect at the midpoint, which, in turn, predicted increased weight loss by the end of the program. Contrary to our hypothesis, self-efficacy at the beginning of the program did not predict weight loss or affective evaluations in later weeks, nor did it function as a mediator in parallel with affect. However, positive affect did emerge as a significant mediator between earlier weight loss and later weight loss. It may be that affective processes are particularly important in the continued success of weight loss, as it was both influenced by and predictive of weight loss throughout the program. Overall we found preliminary evidence of a possible reciprocal relationship between weight loss and affect, but no such association was found with self-efficacy.

SOCIAL INFLUENCES ON SMOKING IN THE SOCIAL NETWORKS OF ADULTS WITH MENTAL ILLNESS ENROLLED IN CESSATION TREATMENT

Kelly Aschbrenner, PhD[1], John Naslund, PhD Candidate[2], Emily Schneider, Undergraduate Student[3], A. James O'Malley, PhD[4]

[1]Geisel School of Medicine at Dartmouth, Nashua, NH; [2]The Dartmouth Institute for Health Policy and Clinical Practice, Lebanon, NH; [3]Dartmouth College, Hanover, NH; [4]The Dartmouth Institute for Health Policy and Clincial Practice, Lebanon, NH

Introduction: Despite significant decreases smoking rates in the US over the past 50 years, an estimated 50-85% of adults with serious mental illness (SMI), such as schizophrenia, bipolar disorder, and major depression, smoke cigarettes compared to 16.8% of adults in the general population. Individuals with SMI generally have social networks of people similarly affected by mental illness and high rates of addiction. Whether and how these networks encourage or limit smoking cessation in this group has received little attention . The purpose of this study was to: (a) describe smoking behaviors in the social networks of individuals with SMI; and (b) explore participants' perceptions of how these networks influence their efforts to quit smoking.

Methods: Participants were 41 individuals with SMI who participated in a state Medicaid demonstration project of smoking cessation at public mental health centers. The study sample consisted of quitters (n=11) and non-quitters (n=30) following treatment. Data collected during cross-sectional egocentric social network interviews was used to estimate proportions of current smokers, former smokers, and never smokers in participants' networks. In addition, a series of open-ended qualitative questions explored participants' perceptions of the influence of individuals in their network (i.e., alters) on their attempts to quit smoking. Alters were defined as family members, friends, peers, significant others, and non-professionals with whom participants spent the most time with in the past 12 months.

Results: Most alters identified by participants were friends (45%) or family members (44%). In the study sample, 53% percent of alters were current smokers; 19% former smokers; and 28% had never smoked. These proportions did not differ significantly by participants' smoking status following cessation treatment. Participants' reported that pro-smoking social norms and attitudes, and alters' smoking habits were barriers to quitting smoking. Social facilitators to quitting included having cessation role models, quitting together with alters, and receiving emotional and practical support from alters for quitting smoking.

Conclusions: Similar to the general population, social factors appear to influence efforts to quit smoking among individuals with SMI enrolled in cessation treatment. A better understanding of the social context of smoking may help to enhance tobacco control research and practice for this high-risk population.

THE EFFECT OF FAMILY COMPOSITION ON RISK COMMUNICATION AND SUBSEQUENT RISK TAKING BEHAVIORS

Danielle E. Reece, MPH Candidate[1], Erin R. Johnson, MPH, CHES[2], Danielle N. Lambert, MPH, CHES[3]

[1]Emory University, Atlanta, GA; [2]American Institutes for Research, Washington, DC; [3]University of Georgia, Atlanta, GA

The effect of family composition on risk communication and subsequent risk taking behaviors

Background: Upbringing and family dynamic in the home play a vital role in shaping behavior later in life. To date, there appears to be limited research on how varying differences in family composition affects risk communication in the home and the likelihood that children residing in the home participate in high-risk behaviors later in life. This study aims to fill that gap.

Methods: The sample was drawn from an online survey that was disseminated through academic institutions, community venues, and social media sites. Responses from 1,011 respondents were collected. Of these, 230 (22.7%) were classified as growing up with non-traditional families and 781 (77.3%) as growing up with traditional families. For the purposes of this study, a traditional family was defined as being raised by two opposite sex parents.

Results: Chi Square tests of independence were performed and results show that individuals who grew up with a non-traditional family were less likely to have received communication about alcohol use than were individuals who grew up with a traditional family (X^2=24.47, df=1, p < .001). Individuals who specifically grew up with a non-relative, grandparent, or extended relative in the home were less likely to have received risk communication about safe sex, substance use, and alcohol (X^2=5.91, df=1, p=.017). Additionally, individuals who grew up with a non-traditional family were more likely to report history of an STI (X^2=4.28, df=1, p=.041). Two-sided t-tests showed that individuals who grew up in a non-traditional family reported being spoken to about fewer risk related topics (mean=1.49, sd=1.24) than individuals who grew up with traditional families (mean=1.72, sd=1.13) (t=2.66, df=1009, p=.008). They also reported a younger age at first sex (mean=17.25, sd=3.74) than those who

grew up with traditional families (mean=17.99, sd=3.80) (t=2.46, df=335.88, p=.014).

Conclusions: These findings suggest that family composition during upbringing is related to both risk communication within the home and subsequent risk behaviors later in life. These results illustrate the importance of considering the social environment of the family in developing effective risk communication and reduction interventions.

ASSESSING COPING IN PREGNANCY: PSYCHOMETRIC PROPERTIES OF THE REVISED PRENATAL COPING INVENTORY

Sirena M. Ibrahim, B.A.[1], Marci Lobel, Ph.D.[2], Jennifer Nicoloro SantaBarbara, MSW, MA[3], Melissa Auerbach, PhD in Social and Health Psychology[4], Lisa Rosenthal, PhD[5], Cheyanne Busso, B.A.[6], Christina Kocis, C.N.M., D.N.P[7]

[1]Stony Brook University, Port Jefferson, NY; [2]Stony Brook University, Stony Brook, NY; [3]Stony Brook University, Long Island CIty, NY; [4]Fox Chase Cancer Center/Temple University Health System, Williamstown, NJ; [5]Pace University, New York, NY; [6]Stony Brook University, deer park, NY; [7]Stony Brook School of Medicine, Stony Brook, NY

It is well established that emotional distress during pregnancy increases women's risk of delivering a low birthweight or preterm infant. Coping research and theory suggest that the ways women manage stress during pregnancy can alleviate or exacerbate distress (Guardino & Dunkel-Schetter, 2013). However, few appropriate tools exist to measure coping in pregnancy. The purpose of the present study was to examine the psychometric properties of an instrument first developed almost 20 years ago to assess coping in pregnancy (Yali & Lobel, 1999).

Data were derived from a larger investigation of women receiving prenatal care from a university hospital midwifery health practice (N = 185). On average, participants were 30 years of age; married or partnered, with at least some college education. They were heterogeneous with respect to parity and ethnicity/race. The Revised Prenatal Coping Inventory (NuPCI; Hamilton & Lobel, 2008) was administered on average at 30 weeks of pregnancy (SD = 4.18). The 42-item NuPCI includes ways of coping that women use "to try to manage the strains and challenges of being pregnant" in the past month on a scale from 0 (never) to 4 (very often).

Data were analyzed with exploratory factor analysis using principal components analysis and orthogonal rotation. Items were eliminated if they failed to load at least 0.30 on any factor (11 items) or failed to contribute to the reliability of any factor (3 items). Five distinct, conceptually interpretable, and internally consistent coping factors were identified from the remaining 28 items: Prayer/Spirituality; Seeking Social Support; Planning/Preparation; Positive Appraisal; and Avoidance. Scores on the avoidance subscale were correlated with pregnancy-specific distress (r's .30 to .37, $p < .001$) and with state anxiety (r's .20 to .31, $p < .01$) at four time points across pregnancy; positive appraisal was inversely associated with state anxiety (r's -.20 to -.29, $p < .05$) in early and mid-pregnancy.

Results indicate that the NuPCI is a psychometrically sound instrument to assess coping in pregnancy. The instrument reliably differentiates ways of coping; frequency of use of two of these ways of coping is associated with emotional distress in predicted directions. The NuPCI can be used to examine how coping may alleviate or aggravate women’s distress during pregnancy and thereby alter the impact of prenatal stress on birth outcomes.

NEUROTICISM, STRESS, AND ERYTHROCYTE SEDIMENTATION: LONGITUDINAL FINDINGS FROM THE VA NORMATIVE AGING STUDY

Carolyn M. Aldwin, PhD[1], Soyoung Choun, PhD[2], Lewina O. Lee, Ph.D.[3], Avron Spiro, PhD[4]

[1]Oregon State Univeristy, Corvallis, OR; [2]Oregon State University, Corvallis, OR; [3]BOSTON UNIVERSITY SCHOOL OF MEDICINE, Arlington, MA; [4]VA Boston Healthcare System, Boston, MA

Objectives. Both neuroticism and stress have been shown to affect inflammatory processes, which in turn underlie many of the chronic illnesses of aging, including cancer, heart disease, diabetes, and neurodegenerative disorders. However, most studies of the association between psychosocial factors and inflammation are either cross-sectional or short-term longitudinal studies, and often use patient samples, in part because of the relative newness of many inflammatory measures and their expense. Erythrocyte sedimentation rate (ESR) is an assessment of general inflammation widely used in clinical settings. It is inexpensive, and has been in use since the 1970's, but is rarely used in behavioral medicine research. The purpose of the current study is to examine the relative contribution of neuroticism and stress to changes in ESR assessments of inflammatory process over 13 years.

Method. We used longitudinal data from the VA Normative Aging Study, selecting 1,229 men (Mage = 65.6 years, *SD* = 6.8) who completed a measure of neuroticism in 1988 and who subsequently completed stressful life events (SLEs) and hassles measures during one or more triennial physical examinations between 1989 and 2002 (observations = 3,134; M = 2.6, range = 1-5). ESR was assessed using the standard Wasserman test from a fasting blood draw (M = 13.99, *SD* = 7.93). We used multilevel models (MLM) to examine the between- and within-person associations among neuroticism, stress, and ESR levels and slope across time.

Results. Unconditional analyses showed that ESR increased over time. Between-person analyses showed that men with higher baseline neuroticism had steeper ESR increase over time. but SLE was only linked to ESR in within-person analyses. Adjusting for between-person differences in SLE, ESR levels were lower on occasions which men reported more SLEs. Controlling for health behavior habits and smoking attenuated this effect slightly. Hassles were not associated with ESR.

Discussion. Neuroticism was associated with increasing levels of inflammation in later life. However, major stressors were associated with lower ESR levels, supporting a two-stage

model; acute stress may decrease inflammation, but chronic stress (presumably experienced by those higher in neuroticism) may show increases (Franceschi & Campisi, 2014). Further long-term longitudinal research into the role of personality and stress in aging and inflammation is warranted.

STAFF PERCEPTIONS OF ALTERED DECISION MAKING IN NICU PARENTS

Carissa Ballew, MPH

Human Lacatation Center, UC Davis, Vacaville, CA

BACKGROUND:

Extreme stress may result in acute stress disorder (ASD). Symptoms of ASD include emotional numbing, avoidance of feelings, sleep disturbances, concentration deficits, intense reactivity to reminders of the stressful event, flashbacks, or irritable behavior. Decisions must be made in all medical environments, including the neonatal intensive care unit (NICU), and some of those decisions influence health outcomes. The prevalence of ASD is 23-55% in NICU parents, and all NICU parents experience one or more symptoms of ASD. Despite the high prevalence of ASD in NICU parents, no known studies have directly examined parents’ impaired decision-making in the NICU.

OBJECTIVES:

Characterize how NICU staff members perceive manifestations of NICU parents’ impaired decision-making and explore how the staff reacts to this impairment.

METHODS:

A series of 25 semi-structured interviews were conducted among registered nurses, neonatologists, registered dieticians, lactation consultants, and social workers who worked in NICU environments. The NICU professionals were asked to share their in-hospital experiences related to parents’ stress and impaired decision making.

RESULTS:

The staff perceptions of causes for parents’ decision-making impairment were broadly categorized into circumstantial and personal reasons and then further subcategorized. Circumstantial reasons for impairment included the NICU environment, socio-economic status and limited access to enabling services, infant acuity, culture and religion, and information sources such as the internet or family members. Staff perceptions of personal reasons why the parents were having decision-making impairment included age and gender, family history, education and intelligence, preferred languages, the parents’ personal capacity for stress, physical or emotional condition, and the parents’ desire for control. The staff reported that they employed many strategies to help the parents with their decision-making including assessing parents' circumstances first and then deciding on a course of action such as taking over, focusing on empowerment, providing emotional and practical support, and tailoring the information delivery to meet the needs of the parents.

CONCLUSION:

All of the staff members recognized that the NICU parents were stressed. Staff also recognized and described manifestations of this decision-making impairment but, rather than attributing these behaviors to stress-related causes, the staff attributed the behaviors to the parents' circumstances or personal characteristics.

THE EFFECTS OF A STRESS MANAGEMENT PROGRAM ON SELF-EFFICACY, STRESS, AND MOOD AMONG LOW INCOME AFRICAN-AMERICAN MOTHERS

Grace M. Thornburgh, B.A.[1], Lauren Dunne, B.A.[2], Colette Brown, B.A.[1], Guido Urizar, Jr., PhD[3]

[1]CSULB PRO-Health Lab, Long Beach, CA; [2]PRO-Health Lab/Build/CSULB, Huntington Beach, CA; [3]California State University Long Beach, Long Beach, CA

African-American women experience a number of chronic stressors (e.g. poverty, racial oppression; Lindblad-Goldberg et. al., 1985) and are twice as likely to die from stress-induced health issues when compared to White women (Heisler et al., 2004). Despite being disproportionately affected by stress, there are few effective interventions that are tailored to address specific risk-factors for African American women (El-Bassel et al., 2009). The present study evaluated the effectiveness of a community-based stress management program for low income African-American mothers. Classes met for two hours, once a week, for six weeks. The class topics included stress awareness, thought replacement, coping skills, social support, and communication. The majority of participants (n = 26) were single with an annual income of $15,000 or less. Mothers were evaluated at baseline and post-intervention using self-report scales to measure self-efficacy (Measure of Current Status), perceived stress (Perceived Stress Scale), depression (Edinburgh Postnatal Depression Scale), and anxiety (State Trait Anxiety Inventory). Pairwise samples t-test analyses revealed significant improvements in women's self-efficacy with reducing their tension by using relaxation skills[t (25) = -5.41, $p < .001$], being able to recognize that there body is physically tense during times of stress [t (25) = -5.81, $p < .001$], being assertive in communicating their needs to others [t (25) = -3.48, $p = .002$], and coping with their stress during difficult situations [t (25) = -3.67, $p = .001$]. Results also showed a significant decrease in perceived stress [t (25) = 3.20, $p < .05$], depression [t (25) = 5.68, $p < .001$], and anxiety [t (25) = 3.80, $p = .001$]. As an underserved population considered high-risk for stress-related health issues, it is imperative that similar interventions be developed and implemented. Given the effectiveness of the current study, the intervention could serve as a model for future clinicians and researchers.

AN EXAMINATION OF THE DECISIONAL BALANCE FOR DRUG USE AMONG TRANSGENDER WOMEN IN NEW YORK CITY

Raymond L. Moody, MA[1], Sitaji Gurung, MPH, MD[2], Demetria Cain, MPH, BS[2], Jeffrey T. Parsons, PhD[2]

[1]Center for HIV Educational Studies and Training, Hunter College, City University of New York (CUNY); Graduate Center, CUNY, Brooklyn, NY; [2]Center for HIV Educational Studies and Training, Hunter College, City University of New York (CUNY); Graduate Center, CUNY, New York, NY

Background: Greater rates of drug use and associated problems have been observed among transgender women compared to the general population. Efforts to curb drug use in high risk populations have often focused on the potential costs of use. Yet some evidence suggests that the perceived benefits of drug use may be a significant target for risk reduction interventions. The present study sought to examine the association between the perceived costs and benefits of drug use and rates of illicit drug use and associated problems in a sample of transgender women.

Methods: A sample of 184 transgender women living in NYC completed baseline assessments as part of the screening process for a transwomen-focused intervention. Baseline assessments included measures of demographic covariates, the Decisional Balance for Substance Use scale, the Short Inventory of Problems for Drug and Alcohol, and a timeline follow-back interview of drug use (previous 60 days).

Results: In total, 52% of the sample reported using one or more illicit drugs in the previous 60 days. After adjusting for demographic covariates, perceived consequences of drug use distinguished low and heavy marijuana users from non-users (B=-1.01, p=03; B=-1.55, p=.002, respectively) and was associated with drug/alcohol related problems (B=6.57, $p < .001$). Perceived benefits distinguished heavy marijuana users from non-users (B=1.48, p=.001), heavy club drug users from non-users (B=.94, p=.02), polydrug users from non-users (B=1.02, p=.005), and was associated with drug/alcohol related problems (B=2.16, p=.04).

Conclusions: Our findings are consistent with previous research and extend findings from previous research to transgender women. The results suggest that the perceived benefits of drug use may be a more meaningful target for reducing rates of drug use compared to

interventions that emphasize the potential consequences of use. Interventions that aim to identify and challenge the perceived benefits or assist in generating alternative strategies for obtaining the desired benefits will likely benefit transwomen more than the traditional risk focused approaches.

EXPERIENCES OF DRUG EXPOSURE AND USE: A QUALITATIVE STUDY OF BLACK FORMERLY INCARCERATED DRUG OFFENDERS.

Rahma S. Mkuu, MPH, CPH[1], Tawandra Rowell-Cunsolo, PhD, MA, BA[2], Idethia Harvey, DrPH[3], Ehikowoicho Idoko, Ms.[1]

[1]Texas A&M University, College Station, TX; [2]Columbia University, School of Nursing, New York, NY; [3]Texas A&M University , Department of Health and Kinesiology, Transdisciplinary Center for Health Equity Research, College Station, TX

Background: Black Americans are vastly overrepresented among those incarcerated for drug related offenses in the United States. Evidence suggests that post-incarceration, formerly incarcerated individuals may be at high risk of drug overdose deaths.
Objective: The purpose of this study is to explore the factors that influence drug use among formerly incarcerated Black drug offenders during the immediate post-incarceration period.
Methods: Qualitative structured interviews were conducted with thirty Black Americans who had been released from prisons in New York State within the past year. One-on-one in-depth interviews explored participant's drug behavior, institutional, environmental and social factors influencing drug use. Transcripts were transcribed, and analyzed using line-by-line coding that resulted in identifying themes by the research team.
Results: The following themes related to facilitating drug use emerged. Participants reported re-entering drug-enticing physical environments (i.e., neighborhoods or shelters) and social environment or social networks were at a greater risk of relapse. The following themes were reported sources for abating drug use: being on parole or other forms of community supervision, access to drug treatment facilities, and social support from family and friends.
Conclusion: Formerly incarcerated individuals continue to face challenges when attempting to reduce or avoid substance use post-incarceration. Interventions that incorporate a social determinants approach and consider the environment and social networks as significant leverage points for behavior change may be warranted.

EXPOSURE TO SECONDHAND MARIJUANA SMOKE: FINDINGS FROM A NATIONAL SURVEY

Jessica Y. Sun, BA, Yue-Lin Zhuang, PhD, Sharon E. Cummins, PhD, Shu-Hong Zhu, PhD

University of California San Diego, La Jolla, CA

As marijuana use, both medicinal and recreational, is legalized in a growing number of states, there is concern about the public health ramifications. There is evidence that secondhand marijuana smoke may be harmful. This study presents the first national data on exposure to marijuana secondhand smoke, and it compares the prevalence of exposure to that of tobacco smoke, which is a well-known public health hazard.

A national survey was conducted with a representative sample of the U.S. adult population in July-August 2016 (N=11,491).

Overall, 8.4% of U.S. adults used marijuana and 15.3% smoked cigarettes in the last 30 days. Of the population, 4.7% currently used marijuana only, 11.6% used cigarettes only, and 3.7% used both, while 80.0% of the population currently used neither.

Overall, 9.5% of the population was exposed to secondhand marijuana smoke in the last 30 days, while 21.4% of the population was exposed to secondhand cigarette smoke. Among those currently using neither marijuana nor cigarettes, 4.1% were exposed to secondhand marijuana smoke, while 12.6% were exposed to secondhand cigarette smoke. Among those exposed to secondhand marijuana smoke, 54.2% were exposed 1-3 days out of the last 30 days, 23.5% were exposed 4-14 days, and 22.3% were exposed 15+ out of the last 30 days. Among those exposed to secondhand cigarette smoke, 42.5% were exposed 1-3 days out of the last 30 days, 29.7% were exposed 4-14 days, and 27.8% were exposed 15+ out of the last 30 days.

When asked about rules about smoking marijuana and cigarettes at home, 81.6% of the population banned indoor marijuana smoking, while 80.3% banned indoor cigarette smoking. Interestingly, only 26.2% of all marijuana users were banned from smoking marijuana at home; in comparison, 50.1% of all cigarette smokers were banned from smoking cigarettes at home.

Overall, 71.2% of the population perceived exposure to secondhand marijuana smoke as harmful. This included 76.4% of those who used neither marijuana nor cigarettes, 58.2% of cigarette-only users, 40.2% of marijuana-only users, and 37.8% of dual users.

Nationally, secondhand exposure to marijuana smoke has reached approximately half that of the exposure to secondhand cigarette smoke. Given the spread of legalization, which is likely to increase prevalence (and in turn, exposure), and the preliminary evidence on risks of exposure to marijuana smoke, there is a need for continued monitoring of the extent of secondhand exposure to marijuana smoke.

INTEGRATED DATA ANALYSIS OF TWELVE NIDA CTN SUBSTANCE USE TREATMENT TRIALS: BASELINE HIV RISK BEHAVIORS AND SUBSTANCE USE

Jennifer L. Brown, Ph.D.[1], Michael D. Eriksen, PhD[1], Nicole Gause, M.A.[1], Gene Brody, PhD[2], Jessica Sales, PhD[3]

[1]University of Cincinnati, Cincinnati, OH; [2]Emory University, Atlanta, GA; [3]Rollins School of Public Health, Emory University, Atlanta, GA

Background: Integrative data analysis (IDA) allows for secondary analyses of multiple original data sets that have been pooled into one using harmonized variables. The aim of this study was to (a) create a pooled data set with harmonized variables combining data from 12 individual behavioral substance use treatment trials conducted within the National Institute on Drug Abuse's (NIDA) Clinical Trials Network (CTN); and (b) characterize participant characteristics and baseline levels of HIV risk behavioral engagement and substance use during the past month across trials.

Methods: 12 behavioral drug treatment trials' data (CTN Trials: 0004, 0005, 0006, 0007, 0009, 0011, 0013, 0014, 0015, 0018, 0019, 0021) were integrated in the pooled dataset (N = 4,865). Participants had a M(SD) age of 34.8(11.4). Most participants were male (55.5%) and 58.6% of the sample were a racial/ethnic minority.

Results: At baseline, the number of participants reporting one or more days using the following substance(s) in the past month was: cocaine (n = 1,766); heroin (n = 661); other opiates (n = 609); and amphetamines (n = 418). Of those reporting injecting with previously used needles in the past month (n = 245), 60.4% endorsed inconsistent or no use of bleach to clean syringes. 48.9% reported having one sexual partner in the past month with 13.8% reporting more than one sexual partner; 37.3% had no sexual partners in the past month. Of those reporting vaginal sex in the past month (n = 2,818), 80.6% reported inconsistent condom use.

Discussion: Results highlight the utility of an IDA approach for examining HIV risk behavior patterns among individuals engaged in NIDA CTN behavioral substance use treatment trials. Data indicate elevated prevalence of HIV risk behavior engagement among individuals participating in community-based substance use treatment trials.

PRESCRIPTION OPIOID MEDICATION USE AMONG PEOPLE WITH MIGRAINE: NATIONAL SURVEY RESULTS

Christopher Malone, M.A.[1], Amy Wachholtz, PhD, MDiv, MS[2], Amrita Bhowmick, MBA[3]

[1]William James College, Brighton, MA; [2]University of Colorado Denver, Denver, CO; [3]Health Union, Philadelphia, PA

The abuse of prescribed and illicit opioid substances has increased among US residents in recent years; with an estimated 1.9 million abusing prescribed opioid analgesics and 586,000 using heroin. Recent research has suggested that the recent rise in opioid abuse among US residents has been driven largely by the increased use of prescription opioid medication. Understanding the contributing factors to the prescription of opioid medication in a chronically ill population may inform and improve the use of opioid analgesics in this population. In this study, we report the findings of an online national survey of 4,139 adult US-based patients diagnosed with migraine. 989 (22.1%) were currently using prescription painkillers for their migraines. 1860 (41.5%) had been prescribed painkillers in the past but were no longer using them and 1290 (28.8%) had never used painkiller medication for their migraines. We assessed negative life events due to migraines and collected information on mental and physical comorbid diagnoses, a self-report mood measure, and other aspects of migraine treatment. Results reveal that the number of mental and medical comorbid disorders (R2=0.029; pfor migraine headache and reported functional impairment due to migraine. The results of the present study enhance understanding of the use of opioid medication prescribing for chronic migraine sufferers. While there are limitations to the present study, the results suggest an underdiagnosed level of psychological distress among chronic migraine sufferers that may be inappropriately addressed with prescription opioids since elevated levels of any type of comorbidity (including non-pain related comorbidities such as seasonal allergies) may lead to increase prescribing of opioids *for migraine headaches*. Methods to more accurately identify levels of psychological distress in people with chronic medical conditions in order to avoid opioid over prescribing are discussed.

VIDA PURA: FEASIBILITY OF SCREENING AND BRIEF INTERVENTION TO REDUCE UNHEALTHY ALCOHOL USE AMONG LATINO DAY LABORERS

India Ornelas, PhD[1], Bonnie Duran, Dennis M. Donovan, PhD[2], Samantha Serrano, MS[1], Vanessa Noel. Torres, PhD[3]

[1]University of Washington, Seattle, WA; [2]University of Washington nschool of Medicine, Seattle, WA; [3]University of Washington, seattle, WA

Background: Due to stressors associated with immigration, Latino day laborers are at increased risk for unhealthy alcohol use. Vida PURA is a culturally adapted intervention that consists of promotores providing screening and brief intervention to Latino day laborers at a day labor worker center. **Methods:** We conducted a pilot randomized control trial to test the feasibility of the Vida PURA intervention and study procedures. Participants were screened for eligibility using the AUDIT (N = 181). Those with an AUDIT score ≥ 6 (N = 121) completed a baseline survey and were randomized into an intervention or control group. Follow-up surveys assessed changes in alcohol use at two weeks and eight weeks following the baseline. Participants in the intervention group received a brief counseling session including personalized feedback about the quantity of their daily and weekly drinking displayed on a tablet screen. Promotores also used motivational interviewing (MI) to assess their readiness to change and encourage behavior change. We evaluated intervention fidelity through a review of 44% of audio recorded counseling sessions for the presence of three steps of the intervention protocol. Additionally, we rated the promotores' motivational interviewing technique with the Motivational Interviewing Treatment Integrity (MITI) 4.2.1 tool and compared scores to competency and proficiency thresholds. We assessed recruitment, retention, and reach using logs and tracking forms. **Results:** Promotores delivered each of the three intervention steps in 78% of selected recordings. Evaluation of MI indicated that the promotores achieved basic competency across all domains and proficiency in 50% of the measures. At 58 weeks of data collection, 69% of screened participants were eligible for the study. Of those eligible, 50% had AUDIT scores ≥ 20, indicating alcohol dependence. Participant retention rates were 86% for the two-week survey and 85% for the eight-week follow-up. **Conclusions:** Initial results demonstrate that promotores can be adequately trained to deliver SBI and increase access to this intervention among an underserved population. Future research should assess the efficacy of Vida PURA to reduce unhealthy alcohol use, especially among those with high AUDIT scores.

ENGAGEMENT IN SMOKING CESSATION TREATMENT FOLLOWING A BRIEF TELEPHONE EVALUATION AND REFERRAL SESSION

Sofie L. Champassak, Ph.D., Suraya Jubaiah, Pharm.D., Timothy Chen, Pharm.D., Mark G. Myers, Ph.D.

Veterans Affairs San Diego Healthcare System, San Diego, CA

Despite evidence that combined treatment with medication and counseling yields the best outcomes, few smokers employ both modalities when attempting to quit. This indicates the importance of efforts to enhance engagement in optimal evidence based treatments. The following reports on various aspects of treatment engagement in a sample of Veterans referred for outpatient smoking cessation treatment who completed a brief telephone call intended to assist with treatment engagement. Veterans were offered participation in outpatient groups or an in-house telephone tobacco cessation program. Of those who completed the brief telephone call, 78.2% (*N* = 308) indicated a desire to attend outpatient or telephone treatment. The present study examined the association of gender, age, ethnicity, diagnosis of a mental health disorder, importance and confidence to quit, attempt to quit in the last year, and number of cigarettes smoked per day with whether smokers were interested in and attended treatment. Veterans who indicated a desire to attend treatment smoked significantly more cigarettes per day (*M* = 19.05, *SD* = 19.73; *M* = 9.77, *SD* = 9.47; *p* < .001) and endorsed significantly higher levels of importance to quit smoking (*M* = 7.66, *SD* = 3.62; *M* = 4.59, *SD* = 4.31; *p* < .001) than those who did not. Of those who expressed a desire to attend treatment, 37.7% (*N*=116) attended. Veterans who attended treatment were older (*M* = 54.08, *SD* = 11.93; *M* = 48.56, *SD* = 13.47; *p* = .001), smoked more cigarettes per day (*M* = 25.63, *SD* = 27.81; *M* = 13.01, *SD* = 9.37; *p* < .05) and endorsed higher levels of importance to quit smoking (*M* = 7.81, *SD* = 3.39; *M* = 6.65, *SD* = 4.16; *p* = .01) than those who did not attend treatment. There were no significant differences found between those who selected individual telephone counseling (38.79%, *N*=45) and those who selected outpatient group counseling (61.21%, *N*=71) suggesting that Veterans are receptive to using various treatment modalities for smoking cessation. This study represents an initial effort to explore the treatment engagement process among Veterans who express interest in smoking cessation treatment and attending treatment. These findings highlight the need to further examine barriers to attending treatment and the importance of efforts to engage Veterans who are younger, smoke fewer cigarettes per day, and endorse lower levels of importance to quit smoking.

PERCEPTIONS OF AN AFFORDABLE HOUSING SMOKING BAN DIFFER AMONG SMOKERS AND NONSMOKERS: IMPLICATIONS FOR POLICY IMPLEMENTATION

Vaughan Rees, PhD[1], Jessica Davine, MSW, MPH[2], Robyn Keske, MSW, MPH[1], Natasha Sokol, MPH[1], Alan Geller, RN, MPH[1]

[1]Harvard T.H. Chan School of Public Health, Boston, MA; [2]Harvard TH Chan School of Public Health, Boston, MA

BACKGROUND: In low incomecommunities, which have high smoking rates combined with a high proportion of multi-unit dwellings, smoking and exposure to secondhand smoke (SHS) pose a chronic health burden. A proposed rule to ban indoor smoking by the U.S. Department of Housing & Urban Development (HUD) may reduce tobacco use and improve protection for up to 2 million public housing residents. To tailor future smoke-free housing implementation strategies, we assessed factors associated with residents' support for a smoking ban and self-reported exposure to SHS, pre- and post-adoption of a smoke-free policy in a multi-unit, affordable housing setting.

METHODS: Adult residents(n=70 smokers; n=168 non-smokers) of 12 affordable housing developments in 4 eastern US states were surveyed immediately prior to, and 6 months after the adoption of a smoking ban. Change in support for the policy and self-reported seeing or smelling SHS in the past month was assessed at baseline and follow-up. Regression analyses assessed odds of supporting the ban and self-reported exposure to SHS at baseline after controlling for smoking status, gender, number of children in the household, level of education and race.

RESULTS: At baseline, only 25% of smokers supported the ban, compared with 83% of non-smokers. These proportions did not change significantly after adoption (30% smokers; 79% non-smokers: p's>0.3). Unemployed residents had lower odds of supporting the ban compared to employed (OR = 0.22; p = 0.021). SHS exposure decreased significantly among nonsmokers after adoption (66% at baseline vs. 40% at follow-up; p

CONCLUSIONS: Smokers and nonsmokers differed in their attitudes and perceived benefits (reduction in SHS exposure) of a smoking ban in multi-unit, low income housing. Smokers were less likely to support the ban compared with non-smokers, and attitudes for each group did not change after adoption. Self-reported SHS exposure decreased after policy adoption among nonsmokers, but not smokers. The findings suggest that smoke-free implementation

and communication strategies must be tailored to the needs of different residents, including smokers and non-smokers, as well as unemployed and younger residents, who may experience unique challenges in complying with a ban.

SLEEP QUALITY IS A SIGNIFICANT PREDICTOR OF QUIT-DAY SMOKING SELF-EFFICACY AMONG LOW-INCOME TREATMENT-SEEKING SMOKERS

Uma Nair, PhD[1], Patricia Haynes, PhD[1], Bradley Collins, PhD[2]

[1]University of Arizona, Tucson, AZ; [2]Temple University, Philadelphia, PA

Introduction: Sleep disturbances are prevalent among smokers. Compared to non-smokers, smokers have an increased risk for poor sleep quality. Extant evidence points to smoking self-efficacy as predictor of smoking behavior change outcomes, but few studies have examined whether sleep quality influences smoking self-efficacy. Purpose: To examine if baseline sleep quality is associated with quit day smoking self-efficacy among treatment-seeking smokers enrolled in a smoking cessation trial. Methods: After completing baseline assessments, N=101 low-income smokers were randomized to receive 4-weeks of (a) an integrated low-intensity physical activity programming with evidence-based standard smoking cessation intervention or (b) standard care cessation only. On their quit day (week4), participants attended an in-person session to complete quit day assessments. Baseline sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI). Results: Sample characteristics included: 51% male, 77% African American, 59% high school education. Participants' mean age was 42.1(+ 10.9), BMI =29.9 (+ 7.4) and nicotine dependence = 5.2 (+ 1.2). Baseline sleep quality score was 6.8 (+3.9) and 55% scored >5, the clinical cut-off for poor sleep quality. Multivariate regression analysis showed that better sleep quality (b=-.63; p=.03) was associated with greater quit day smoking self-efficacy, after controlling for empirically relevant variables known to be associated with self-efficacy (e.g., nicotine dependence, depressive symptoms). Conclusion: Results suggest that sleep quality during the pre-quit period may undermine smoking self-efficacy. Given the overall poor levels of baseline sleep quality, these data suggest that sleep may be an important consideration in smoking cessation programs.

SMOKING AND URGENCY IN EARLY ADOLESCENCE: A 5 YEAR LONGITUDINAL STUDY

Gabriella E. Puleo, M.S., Elizabeth Riley, MS, Gregory T. Smith, Ph.D., Jessica L. Burris, PhD

University of Kentucky, Lexington, KY

Background: Among US early adolescents (i.e., youth ages 12-14 or middle school students), the prevalence of cigarette smoking is at its lowest level in recent decades. However, since the overwhelming majority of adult smokers began in early adolescence (and once established, smoking is a very hard behavior to curtail), it remains critically important to study early trajectories of smoking and identify new targets for prevention and intervention. **Objective:** This longitudinal study examines the prevalence of early adolescent smoking and tests a model of reciprocal determinism between smoking and urgency (i.e., the tendency to act rashly in response to intense positive or negative mood). **Method:** 1906 US early adolescents (50% female, 39% racial minorities) completed questionnaires 1-2 times per year starting in 5th grade and ending in 9th grade; retention was 75% across all eight waves. Structural equation modeling allowed tests of longitudinal, reciprocal relationships between smoking and urgency controlling for pubertal status and negative affect at each wave. **Results:** Ever smoking increased from 6% to 27% over time, with current smoking near 5% at the final wave. Urgency at each wave predicted smoking at the next wave, above and beyond the predictive utility of covariates and prior smoking (all $p < .001$). Likewise, in all but one case, smoking predicted an increase in urgency at subsequent waves above and beyond the predictive utility of covariates and prior urgency (all $p < .05$). **Conclusion:** With a large sample of US adolescents, this longitudinal study is unique in its examination of a bidirectional relationship between behavior and personality. Results show that while the overall prevalence of smoking may be low among early adolescents, risk for smoking increases with higher levels of urgency. Results also show that urgency increases secondary to participation in smoking. Moving forward, treatment studies should explore urgency as a point of prevention/intervention for smoking as well as smoking cessation as a means to lessen mood-based impulsivity.

TOBACCO PRODUCT USE AMONG PERSONS WITH MENTAL HEALTH SYMPTOMS

Sandra Japuntich, Ph.D.[1], Rochelle K. Rosen, PhD[2], Lori A. J. Scott-Sheldon, PhD[3]

[1]The Miriam Hospital, Providence, RI; [2]Brown University School of Public Health, Providence, RI; [3]The Miriam Hospital and Brown University, Providence, RI

Background: Individuals with current mental illness are twice as likely to use tobacco, smoke more cigarettes per day, and experience more difficulty quitting than those without mental illness. Challenges to quitting may lead smokers with mental illness try alternative tobacco products at higher rates than smokers without mental illness. The purpose of this study was to determine the use of cigarettes and other tobacco products among smokers with poor mental health. Method: Data from the adult sample of the Population Assessment of Tobacco and Health (PATH) study, a nationally representative survey of 32,320 tobacco users and non-users, were used. Participants rated their current mental health on a 5-point scale (excellent-poor) and self-reported awareness, ever and current use of tobacco products. Results: Poorer mental health was associated with higher rates of ever (OR=1.33, $p < .001$) and current smoking (OR=1.48, $p < .001$); e-cigarette awareness (OR=1.16, $p < .001$), ever (OR=1.25, $p < .001$) and current (OR=1.23, $p < .001$) e-cigarette use; cigar/cigarillo awareness (OR=1.11, $p < .001$); ever (OR=1.14, $p < .001$) and current (OR=1.19, $p < .001$) cigarillo use; pipe awareness (OR=1.07, $p < .001$), ever pipe smoking (OR=1.08, $p < .001$); and smokeless tobacco awareness (OR=1.08, $p < .001$), higher ever (OR=1.04, p=.004) but lower current (OR=0.94, p=.006) smokeless tobacco use. There was no association between self-reported mental health status and ever or current cigar use; current pipe smoking; hookah awareness, ever or current hookah use. Poorer mental health was associated with a greater number of ever and current tobacco products used (ps < .001). Conclusion: Consistent with cigarette smoking, awareness and use of other tobacco products was more prevalent among those with poorer mental health. Notable exceptions include tobacco products typically used in social situations (e.g., hookah). Multiple tobacco use places individuals with mental illness at a higher risk for tobacco-related disease. Targeted prevention and intervention strategies are needed for individuals with poor mental health.

USING ECOLOGICAL MOMENTARY ASSESSMENT TO INVESTIGATE SUBSTANCE CO-USE AMONG YOUNG ADULT SMOKERS

Johannes Thrul, PhD[1], Louisa Holmes, PhD[2], Pamela Ling, MD, MPH[1]

[1]University of California, San Francisco, San Francisco, CA; [2]SUNY Binghamton, Binghamton, NY

Introduction: The use of alcohol and marijuana plays an important role for tobacco smoking behavior, especially among young people. Young adults smoke a large proportion of their cigarettes under the influence of these substances. However, previous findings about co-use of cigarettes, alcohol, and marijuana may be unreliable as they are based predominantly on retrospective survey studies covering recall windows of 30 days or more, which are limited by recall bias. Studies are needed to investigate patterns of co-use using assessments more closely timed around use occasions.

Methods: We used a smartphone-based assessment system to collect Ecological Momentary Assessment (EMA) data from young adult smokers, ages 18-26, and completed a pilot feasibility study with 9 participants (age M=23, 56% female, 56% daily smokers). Participants living in the San Francisco Bay Area were recruited on Facebook and completed screening, informed consent, and baseline questionnaires online. For a total of 30 days, participants were prompted once each morning to complete an assessment of tobacco, alcohol, and marijuana use, including detailed questions about substance co-use (e.g., smoking tobacco while using another substance) covering the entire previous day. Participants completed 78% of these previous-day assessments, contributing a total of 210 participant-days (23.3 days per participant).

Results: Cigarette use was reported on 96.2% of days, alcohol use on 32.9%, and marijuana use on 29.5%. Co-use of cigarettes and alcohol was reported on 19.5% of days and co-use of cigarettes and marijuana on 22.4%. Participants reported to have smoked the majority of cigarettes (all or most of them) under the influence of alcohol on 48.8% of co-use days and under the influence of marijuana on 25.5% of co-use days. On co-use days, the number of cigarettes was significantly associated with number of alcoholic drinks (r=.23; p=.05), but not with number of times of marijuana use (r=.10; p=.45).

Conclusion: Young adult smokers participating in our study reported a similar number of days co-using cigarettes and alcohol or marijuana. However, on these co-use days, a greater proportion of cigarettes were co-used with alcohol compared to marijuana. Smartphone

based EMA studies can help to elucidate patterns of substance co-use in great detail, improve our understanding of co-use, and inform development of mobile interventions.

Symposium 1 8:00 AM-9:15 AM

CONNECTING THE DOTS: TRANSLATING EVIDENCE TO ADVANCE HEALTH EQUITY IN PRECISION MEDICINE

Kassandra I. Alcaraz, PhD, MPH[1], Clement K. Gwede, PhD, MPH, RN, FAAN[2], Karen Yeary, PhD[3], Usha Menon, PhD, RN, FAAN[4], Kimlin Tam. Ashing, Ph.D[5]

[1]American Cancer Society, Atlanta, GA; [2]Moffitt Cancer Center, Tampa, FL, FL; [3]University of Arkansas for Medical Sciences, Little Rock, AR; [4]University of Arizona, Tucson, AZ; [5]City of Hope National Medical Center, Duarte, CA

Precision medicine (PM) holds great promise for advancing disease prevention and treatment by considering genetic, environmental, and behavioral influences on health. However, underserved populations must be appropriately represented and engaged to eliminate health disparities. The ConNECT Framework, focusing on five broad and synergistic principles (Integrating Context, Fostering a Norm of Inclusion, Ensuring Equitable Diffusion of Innovations, Harnessing Communication Technology, and Prioritizing Specialized Training), is a new and actionable model designed to foster health equity in behavioral medicine. A multidisciplinary panel of experts will present the application of the ConNECT Framework to evidence-based health equity approaches pertinent to PM. The first presenter will discuss strategies for proactive and consistent inclusion of medically vulnerable and socially marginalized populations. The second presenter will discuss ways to elucidate context, using the social context of religion and spirituality as an example. The third presenter will discuss methods for equitable dissemination of new research knowledge with respect for unique cultural and social factors (e.g., religious beliefs) that influence individual receipt and co-production of health information. The discussant will synthesize and critically examine strategies presented including identifying potential challenges and barriers to implementation. The symposium will provide a plan of action for advancing health equity in the era of PM.

Symposium 1A

FOSTERING A NORM OF EQUITABLE INCLUSION IN PRECISION MEDICINE

Dr. Clement K. Gwede, PhD, MPH, RN, FAAN

The emphasis on precision medicine (PM), with its advancements in the biological bases on health, brings exciting new opportunities for the integration of behavioral, contextual, and place-based determinants of health. PM holds great promise for reducing health disparities, and stimulating equity efforts in behavioral medicine science and practice. Community-based participatory research (CBPR) provides an important and salient framework and approach to enhance inclusion and representation of underserved and vulnerable populations in behavioral medicine research and practice. CBPR-informed initiatives have effectively helped to increase participation of diverse groups in population health efforts including community-based interventions and clinical trials. The ConNECT framework, comprised of five broad and synergistic health equity-centric principles, emphasizes the essential role of CBPR to improve diversity and inclusion with the ultimate goal of maximizing equity in all areas of health. This presentation addresses the second ConNECT principle, fostering a Norm of Inclusion (*consistently engage and examine diverse groups)* to further integrate CBPR, PM, and emerging communication technologies to achieve health equity. It offers exemplars of how ConNECT improves inclusion in four areas: 1) stepwise integration of CBPR in the context of prevention, clinical, and community trials to increase representation and participation of historically underserved racial/ethnic minorities and other marginalized groups (e.g., sexual minorities); 2) promoting biobanking and participation in biospecimens research among historically vulnerable and at-risk groups; 3) leveraging communication technologies (e.g., smartphones, patient portals) for broader reach to diverse and underserved populations, and 4) disseminating cultural competence training for equitable care delivery across diverse levels of health care providers, public health practitioners, and policy makers. The ConNECT Framework helps generate and translate emerging PM knowledge into tangible and meaningful benefit for all patients, communities, and society so that no one is left behind.

Symposium 1B

INTEGRATING CONTEXT: CONSIDERING RELIGION AND SPIRITUALITY IN PRECISION MEDICINE

Karen Yeary, PhD

Religion and spirituality (R/S) are important components of the social context that have documented relationships with health behaviors, in particular the acceptability, decision making, and uptake of health screening, diagnostics, and therapeutics. Precision medicine (PM) has prompted excitement in the scientific community for its capacity to treat and prevent disease through individual tailoring treatments and prevention strategies. Specifically, precision medicine takes into account an individual's unique biological, behavioral, and environmental—including social—context. Yet the social context component of R/S has not been adequately considered. R/S may have particular salience in health equity, as some groups bearing a disproportionate burden of disease report higher levels of R/S than the general population (e.g. African Americans). The ConNECT Framework, which emphasizes the importance of considering social and contextual health factors to foster health equity, is a model through which R/S's role in PM can be discussed.

Epidemiological literature has documented R/S's significant associations with both physical and mental health outcomes, including biological markers (e.g., CD4 counts/percentages). Qualitative research has explored the role of R/S beliefs in disease perception, treatment, and preventative behaviors (e.g., cancer, cancer screening). The fields of sociology and psychology have investigated the powerful role of religious institutions as social forces that influence health behaviors (e.g., alcohol use) through social norms. Moreover, intervention science has reported the important role of R/S in health promotion.

Guided by ConNECT Framework strategies, the proposed presentation will discuss: 1) the relevance of R/S to health equity in PM; 2) recommended R/S assessments to include in data collection for individualized health recommendations; 3) the use of R/S data to explicitly tailor information exchange and the design of studies (including communication technology) for individuals (e.g., health education material tailored to an individual's R/S beliefs); and 4) incorporation of R/S into provider and health practitioner training in PM delivery. Consideration of the R/S domain of care can align with the underlying tenets of individualized clinical care and treatment, and contribute to health equity in PM.

Symposium 1C

PRECISION MEDICINE AND EQUITABLE DISSEMINATION OF INFORMATION

Dr. Usha Menon, PhD, RN, FAAN

In our recently published *ConNECT Framework: A Model for Advancing Behavioral Medicine Science and Practice to Foster Health Equity,*we addressed health equity from a behavioral medicine lens with one of the focal points being the equitable dissemination of research findings.Equitable dissemination of information is an important component in the growing field of precision medicine (PM).

PM offers a tremendous opportunity for revolutionizing how we prevent and treat disease and improve health. If we achieve the national goals set forth for the one million-strong Precision Medicine Initiative cohort by the White House, health care providers will be able to apply cutting edge genomics and genetic testing data to the personalized treatment of risk and disease. Ideally, these innovative treatments will also take into account individual differences in people’s genes, environments, and lifestyles.

However, as with any advances in medicine, we should learn from the past, in that as we ‘write the playbook’ for PM, considerations of health equity and underserved groups are well integrated into the planning and not as an afterthought. The dissemination component of the ConNECT Framework provides a roadmap for PM whereby participants are engaged in receiving and providing health information for the purposes of enhancing research, *information exchange of study findings*, and ensuring ethical practices in *PM.* Engaging multiple organizations and institutions within communities (e.g. community health clinics, faith-based organizations, non-profit organizations) is essential in equitable dissemination of information and to ensure that the information is responsive to the unique needs of these groups. To be fully effective, precision treatments of disease and risk reduction must be accessible to all communities and must not contribute further to health inequities. Further, factors that influence the participation of individuals in genetic studies as well as their desires to receive information related to their risk factors and current health conditions (e.g., cultural norms, spiritual and religious tenets, and medical truth-telling) should also be considered. We elucidate a framework for robust engagement through information exchange, treatment access, and diffusion of research findings that promotes health equity.

Symposium 2 8:00 AM-9:15 AM

INCORPORATING CANCER SCREENING INNOVATIONS IN INTEGRATED HEALTH SYSTEMS

Sherri Sheinfeld Gorin, PhD, FSBM[1], Sara J. Knight, PhD[2], Suzanne O'Neill, PhD[3], Amy M. Kilbourne, PhD[4]

[1]New York Physicians Against Cancer, http://nypac.center/, New York, NY; [2]University of Alabama at Birmingham, Birmingham, AL; [3]Georgetown University, Washington, DC; [4]U.S. Dept. of Veterans Affairs, Veterans Health Administration, Ann Arbor, MI

Integrated health systems have a vested interest in population health focusing on cancer prevention and control. Yet, implementing innovations in cancer screening can be complex, often necessitating engagement of both patients and other stakeholders across multiple levels of the health system. Beyond dissemination of evidence, planned implementation processes are often needed to incorporate novel behavioral medicine interventions in integrated health systems. In this symposium, we examine two instructive cases of the dissemination and implementation of innovations in cancer screening—the introduction of genomic services to screen for Lynch syndrome, a hereditary colon cancer, in the Department of Veterans Affairs (VA) health system and the incorporation of technology to support breast density notification as a component of breast cancer screening in an integrated care setting in the Pacific Northwest. The two cases will illustrate how the characteristics of the innovations, conceptual models, research designs, stakeholder engagement methods, and organizational settings influence the adoption of new approaches to cancer screening in clinical practice in health systems. The first speaker will reflect on the multilevel contexts (policy, provider, and patient) for the translation of novel cancer screening interventions in large healthcare organizations and the broader social and political emphasis on efficient coordinated and patient-centered care. In the second presentation, the speaker will consider findings from a pre-implementation mixed methods project using the Greenhalgh Diffusion of Innovation model to examine the adoption of screening for Lynch syndrome in Veterans under age 50 diagnosed with colorectal cancer and cared for in the VA health system. The third speaker will describe a hybrid efficacy implementation project using the RE-AIM framework to inform a personalized web-based breast cancer risk communication and decision support tool for women with dense breasts and increased cancer risk seen in an integrated care setting. The discussant will compare and contrast the two cases offering an implementation science perspective on opportunities to improve the integration of novel cancer interventions in large health care organizations through the use of deliberate implementation processes.

Symposium 2A

MULTILEVEL CONTEXTS FOR IMPLEMENTING NOVEL INTERVENTIONS IN CANCER

Dr. Sherri Sheinfeld Gorin, PhD, FSBM

New sources of medical evidence or best practices, such as those provided by these two studies, and long-standing USPSTF guidelines, are not always put into use by health providers, or are put to use only inconsistently. This presentation will explore the multilevel (policy, provider, patient) barriers to successful implementation of novel, evidence-based cancer interventions that promote informed preference based medical decisions in large, integrated healthcare systems; Each level influences the other, either implicitly or explicitly. For example, patients and clinicians are never really isolated from the healthcare organization in which they are embedded. Patients may not make preference-informed medical decisions if clinicians do not engage them in discussion about the best evidence. Similarly, healthcare organizations may not incentivize such patient–clinician communication if patient loads and processes leave clinicians with little time or support to address the complexity of individualized decisions for patients. Organizational resources and tools to encourage, empower, and motivate clinicians to adopt the practice of individualized decision making and to ensure sustained awareness of the decision-making process can range from the simple to the complex, including decision aids and programs that might model likely patient outcomes. In response to external accountability demands or internal quality improvement initiatives, organizations may assess conflicts or inconsistencies within the context of health services delivery, particularly those arising between clinicians and patients regarding the use of new technologies, such as breast density measurement or routine Lynch syndrome assessment. In the event of a positive test, the follow up and monitoring, possible diagnosis and treatment of cancer are costly, especially among patients with multiple chronic problems. Population-based measures of access, uptake of preventive services, and mortality rates may be used by organizations to assess individualized decisions and the quality of the healthcare organization. Existing organizational performance indicators may be inadequate to assess the impact of routine genetic testing, however. The multilevel framework has its genesis in the Patient Protection and Affordable Care Act and the Institute of Medicine’s emphasis on efficient coordinated and patient-centered care. The findings from a recent systematic review and meta-analysis suggest that multilevel interventions have positive outcomes across a number of health behavior outcomes for racial/ethnic subgroups and the poor. The findings also suggest that multilevel interventions may improve the quality of health-care system processes for subgroups that often receive sub-par healthcare.

Symposium 2B

LYNCH SYNDROME SCREENING IN ROUTINE CARE FOR VETERANS WITH COLON CANCER IN THE VETERANS AFFAIRS HEALTH SYSTEM

Dr. Sara J. Knight, PhD

Precision medicine, including genomics, is dramatically changing the way health risk assessments inform health decision making, a Department of Veterans Affairs (VA) health system priority. Screening for Lynch syndrome, a hereditary cancer associated with an 80% lifetime risk of colon cancer and lesser risk of seven other cancers, was one of the first applications in genomics to accumulate evidence for its clinical validity and utility. While national guidelines supported screening for Lynch syndrome, in many health systems, including the VA, adoption has been lower and more variable than would be expected based on the recommendations. To address this gap between evidence and practice, we sought to characterize the adoption of Lynch syndrome screening in the VA health system between 2003 and 2013. The Greenhalgh Diffusion of Innovation Model guided our selection of methods to examine system readiness for the innovation, stakeholder engagement, and potential for deliberate implementation processes.

We used mixed methods to: 1) establish a national retrospective cohort of all Veterans under age 50 and cared for in the VA between 2003 and 2010 using VA administrative data, clinical registry data, and the electronic health record (n=886) and 2) conduct national key informant interviews with stakeholders in 2013 to identify barriers and facilitators to the adoption of Lynch syndrome screening (n=58 clinicians). Quantitative and qualitative analyses were triangulated to understand system readiness for adoption of genetic consultation and tumor analysis, key elements used in screening to inform subsequent germline testing.

The analysis revealed a low rate of tumor analysis (8%) and genetic consultation (4.85%) from 2003 to 2008 with a slight rise in utilization during 2009. Of the 108 VA Medical Centers with colon cancer cases, 62% and 69% lacked documentation of tumor testing or referral to a clinical genomics expert, respectively. Key informant interviews in 2013 indicated that clinicians perceived both tumor testing and consultation with a genomics expert as advantageous and inexpensive, but clinicians reported challenges--lack of expeditious request and approval routines for referrals, knowledge gaps in genomics among health professionals, and lack of genomics expertise in VA clinical settings.

Triangulating information from multiple data sources and stakeholder engagement activities revealed receptiveness to Lynch syndrome screening among VA clinicians, but multiple barriers occurring at the individual and system level impeded routine use. Subsequent engagement of VA system level leaders has used these results to inform planning for deliberate implementation.

Symposium 2C

PREPARING TO TEST A DECISION SUPPORT TOOL FOR WOMEN WITH DENSE BREASTS IN AN INTEGRATED CARE SETTING: LESSONS LEARNED

Suzanne O'Neill, PhD

Background: Over half of US states require breast density disclosure to women following screening mammography. This proliferation has occurred without evidence of clinical benefit, clinical guidelines, or established best practices for risk communication or clinical integration. To address this gap, we have developed a personalized, web-based breast cancer risk communication and decision support tool for women with dense breasts and clinically elevated cancer risk. As we prepared to test this intervention vs. usual care in an integrated care setting, we completed a series formative stakeholder engagement activities.

Methods: Engagement activities included focus groups with patients, in-depth pre-testing of the preliminary tool with patients, interviews with health care providers and delivery system leaders and engagement of the breast care guideline committee within the health care system.

Results: Most focus group participants were aware of breast density, but unfamiliar with its role as a breast cancer risk factor. Women noted that the tool’s appearance and branding should convey its credibility and that the intervention methods should engage their primary care providers, as these were noted as a trusted source of information. Patients in usability testing (n=8, mean age=60) rated the tool high on acceptability and ease of use, and provided feedback to improve the communication of cancer risk and risk management approaches. Health care providers and clinical leaders highlighted key areas for provider engagement prior to the trial’s launch. These included clarifying referral pathways and mechanisms, alignment with the clinical guidelines within the system, and monitoring of clinical impact within the health system.

Discussion: Incorporating multiple stakeholder perspectives greatly facilitated the development of this web-based decision support intervention. Iterative feedback across a group of diverse stakeholders within this integrated health care system additionally supports the execution of our RCT. This formative work will also allow us to contribute to developing additional guidance to fill the ongoing clinical vacuum created by legislative mandates.

Symposium 3 8:00 AM-9:15 AM

ACADEMIC-BUSINESS PARTNERSHIPS…BENEFITS, BARRIERS, AND OPPORTUNITIES, OH MY!

Amy McQueen, PhD[1], Gregory Norman, PhD[2], Jamie L. Studts, PhD[3], Audie Atienza, PhD[4]

[1]Washington University, School of Medicine, St. Louis, MO; [2]West Health Institute, La Jolla, CA; [3]University of Kentucky College of Medicine, Lexington, KY; [4]ICF, Rockville, MD

Academic researchers develop scientific expertise in niche areas and seek to apply their theories and results in dynamic real-world environments. For-profit and non-profit organizations engage with hundreds to millions of diverse individuals, and continually seek to innovate their services and products to increase their competitive advantage in the marketplace. Partnerships between academia and business are not new, but are not well understood. This symposia will present three successful examples of academic-business collaborations. Each speaker will address common phases of development (e.g., forming, storming, norming, performing) including challenges and benefits of each. They will discuss experienced-based approaches to dealing with funding, publication, conflicts of interest, protecting intellectual property and research credibility, as well as gains in knowledge, innovation, and the co-creation process. The first presentation will involve an overview of tobacco cessation research conducted as part of Small Business federal-government (SBIR/STTR) grants with a health technology company. The second presentation will provide an overview of a unique industry-funded Center for Health Behavior Change and the collaborative health communication research being conducted to engage commercially-insured and Medicaid-insured populations in life-centered health behavior change programs. The third presentation will describe the role of a unique medical research organization in facilitating collaborative research with hospitals, healthcare organizations, and foundations. The discussant will offer some perspective on the strengths, opportunities, and challenges of different models of academic-business partnerships that involve government, university, business, non-profit and healthcare stakeholders.

Symposium 3A

INNOVATIVE HEALTH COMMUNICATION RESEARCH INVOLVING MEDICAID BENEFICIARIES AT THE ENVOLVE™ CENTER FOR HEALTH BEHAVIOR CHANGE

Dr. Amy McQueen, PhD

Health communication campaigns can have great reach and impact attitudes, intentions and behaviors. However, people are inundated with health information from diverse sources. People do not pay attention to all messages, nor do they always prioritize health when other life demands are more salient. The industry-funded Center for Health Behavior Change is a research collaboration between two universities and a large corporation. The health communication research team examines new methods for reaching, informing, and engaging people in health programs. Specifically, we seek to explore life priorities, preferences for life activities, and life values as novel approaches to tailor messages and programs to meaningfully engage adults in their healthcare. Study 1 recruitment is ongoing; we completed qualitative interviews with adults with commercial (n=61) and Medicaid (n=25) health insurance. Interviews include card sort exercises involving 31 alternative terms for a health coach (e.g., advisor, helper, guide) or exposure to one of twelve paper prototypes of a future online health coaching and goal-setting program. Prototypes vary in approach (risk-based recommendation, choice of health behaviors to address, or choice of life-centric priorities to address) and formatting (when coaches are introduced, data capture methods). Results include preferences for coaching terms, expected services and characteristics of coaches; reactions to the different approaches and design features; and motivations and barriers for behavior change. Study 2 began recruitment of ~1200 Medicaid beneficiaries in four states to complete an online survey to validate a new measure of life values and examine how values influence health attitudes and behaviors. These formative studies will support a future intervention trial to compare different messaging or engagement approaches with Medicaid beneficiaries to improve health behaviors and outcomes. This unique academic-industry partnership has produced a synergistic learning environment for academic researchers and business professionals to expand their horizons toward impacting millions of Medicaid beneficiaries through evidence-based strategies tailored on meaningful life values and priorities.

Symposium 3B

WEST HEALTH: AN INNOVATIVE MODEL OF COLLABORATIVE RESEARCH TO ENABLE SENIORS TO SUCCESSFULLY AGE IN PLACE.

Gregory Norman, PhD

The fastest growing segment of the US population is people over age 80. This group is part of a demographic shift happening in the US where about 10,000 baby boomers turn 65 each day, which will result in 20% of the US population over age 65 by 2030. There is a growing recognition that the current health care system is unable to support the unique needs of seniors including clinical and social supportive services.

The West Health mission is to enable seniors to successfully age in place, with access to high-quality healthcare and support services that preserve and protect seniors' dignity, quality of life and independence. West Health comprises the non-profit West Health Institute, the non-partisan West Health Policy Center and the Gary and Mary West Foundation. Through applied medical research, policy and advocacy and outcomes-based funding, West Health focuses on studying, developing and advancing scalable, sustainable and affordable healthcare delivery models that enable seniors to successfully age.

The presentation will discuss ongoing projects and lessons learned on conducting multi-discipline collaborations that address the patient, provider, and payer perspective of healthcare. One example of West Health's efforts is the establishment of a Qualified Clinical Data Registry (QCDR) for home-based medical practices. Currently, no nationally recognized quality of care measures exist. West Health is partnering with two academic institutions, a national professional society and a technology vendor to equip home-based medical care to engage in value-based care. Utilizing the QCDR, practices can engage in payer-required reporting, performance measurement, and quality improvement. In addition, the QCDR can fill gaps in payers' knowledge of the needs and outcome measures of seniors with multiple chronic conditions.

Another example is West Health's engagement in initiatives around geriatric emergency care. West Health is collaborating with an academic health system to establish the first Geriatric Emergency Department (GED) in San Diego. The GED will test a senior-specific workflow including screenings for fall risk, delirium, and functional ability. On a national level, West Health is partnering with health systems to incorporate GED guideline-based care improves patient outcomes and is cost effective, as well as build the data infrastructure for performance monitoring and evaluation of GEDs.

West Health works with researchers, clinicians, policy makers, and community organizations to create inter-disciplinary collaborations with a strong emphasis on adoption and sustainability. This unique research collaboration and funding model creates opportunities to address gaps in the science of aging, advance policy changes, and most importantly drive adoption of senior-specific care models at a more rapid pace than other extramural support mechanisms.

Symposium 3C

CONDUCTING APPLIED TOBACCO CONTROL RESEARCH WITH SBIR/STTR FUNDING: AN ACADEMIC-INDUSTRY PARTNERSHIP

Dr. Jamie L. Studts, PhD

The Treating Tobacco Use and Dependence Clinical Practice Guideline firmly advocates for the integration of evidence-based tobacco treatment strategies in all healthcare settings. However, many clinicians receive suboptimal training in this important area of care and fail to implement tobacco control strategies with their patients who are current and former tobacco users. In a collaboration between a university and a health technology company, we have worked to adapt and evaluate QuitAdvisor, a web-based point-of-care clinical decision support tool designed to facilitate implementation of evidence-based tobacco treatment interventions in diverse health care settings and by a range of clinicians. This academic-industry collaboration has benefitted from a series of SBIR and STTR funded grants that have facilitated adaptation of the original primary care-based QuitAdvisor tool into QuitAdvisorDDS and QuitAdvisorOB and subsequent usability testing, pilot testing and clinical trials evaluating feasibility, acceptability, and efficacy of these tools. While the initial partnership was born of a desire for an independent evaluation of the QuitAdvisorDDS tool, the team evolved into sharing responsibility for generating targeted and tailored content while the industry partner maintained responsibility for technological design and support and the academic partner oversaw the research design and evaluation. This relationship allowed for independent responsibility of two separate domains of expertise but shared responsibility for the content arena. From the beginning of the collaboration, there were shared values pertaining to evidence-based care and a desire to expand access to high quality tobacco treatment. The principal challenge has involved the distributed nature of the collaboration with the two partners working thousands of miles apart and for arranging sufficient in-person and technology enhanced meetings to facilitate progress. This successful partnership has created new opportunities and is evolving toward a new line of research dedicated to integrating QuitAdvisor into a broader package of tools dedicated to improving health outcomes in alignment with current health policy and healthcare innovations.

Symposium 4 8:00 AM-9:15 AM

MULTIMORBIDITY IN OLDER ADULTS AND CANCER SURVIVORS: BEHAVIORAL, COGNTITIVE-AFFECTIVE, AND BIOLOGICAL PROCESSES

Jerry Suls, PhD[1], Thomas V. Merluzzi, PhD[2], Elliot Friedman, PhD[3], Melanie Keats, PhD[4], M. Bryant Howren, PhD, MPH[5]

[1]National Cancer Institute, Bethesda, MD; [2]University of Notre Dame, Notre Dame, IN; [3]Purdue University, West Lafayette, IN; [4]Dalhousie University, Halifax, NS, Canada; [5]Veterans Administration, Iowa City, IA

Multimorbidity--the presence of two or more primary chronic conditions in an individual--is increasingly common and places considerable burden on patients and the healthcare system alike, including cost, adverse mental and physical health outcomes, and quality of life. Although health psychology and behavioral medicine have long focused on the co-occurence of psychological and medical morbidities, there has been much less attention paid to the behavioral mechanisms and associated factors which may contribute to the development of and adjustment to multiple primary chronic conditions. This symposium, sponsored by SBM's Multimorbidity Special Interest Group, will discuss the role that behavioral, cognitive-affective, and biological processes may play in understanding the development, progression, treatment, and recovery in those with multimorbidity. Dr. Merluzzi will examine the relationship between serious comorbidities and functional impairment and a mediated coping model testing how coping attenuates or exacerbates the relationship between comorbidities/functional impairment and distress. Dr. Friedman will outline a guiding model for, and present results from, studies examining the interactive influences of psychological well-being and inflammation on the links between multimorbidity and disability. Finally, Dr. Keats will describe results from a national prospective cohort study, focusing on the prevalence of physical activity in individuals with a self-reported history of chronic disease, particularly those with two or more chronic diseases.

Symposium 4A

THE ROLE OF COPING IN THE RELATIONSHIP BETWEEN SERIOUS COMORBIDITIES AND EMOTIONAL DISTRESS

Dr. Thomas V. Merluzzi, PhD

Introduction: Comorbidities add burden by increasing allostatic load (Sterling & Eyer, 1988) and negatively affecting quality of life (Vissers et al, 2013). Moreover, comorbidities are correlated with functional impairment, which may intensify distress. Data support the effects of comorbidities on patient care and mortality (Sogaard et al, 2013). However, comorbidity models that take into account functional impairment and coping mechanisms may clarify processes that mitigate or exacerbate outcomes. The current study examined 1) the relationship between comorbidities and functional impairment and 2) a mediated coping model testing how coping attenuates or exacerbates the relationship between comorbidities/functional impairment and distress. Method: 407 patients and survivors (mixed diagnoses) completed measures of Serious Comorbidities, Coping (BriefCOPE), Functional Impairment (Sickness Impact Profile-SIP) and Emotional Distress (HADS+QLACS-Negative Feelings). Regression analysis included age, time since diagnosis, education level, and income as covariates. The independent variable was a composite of the number of Comorbidities and Functional Impairment scores. Mediating variables were coping processes (Action Planning; Support/Advice Seeking; Disengagement/Denial). The outcome was Emotional Distress. Results: The mediation effect from Comorbidities/Functional Impairment to Disengagement/Denial Coping to Emotional Distress was significant: Path coefficients: Comorbities/Functional Impairment to Disengagement/Denial (Est.=1.839; CI: 1.257, 2.426), and Disengagement/Denial to Distress (Est.=4.604; CI: 3.751, 5.457). Also, there was significant direct effect of Comorbidities/ Functional Impairment on Distress (Est.=.437; CI: 0.552, 0.831); thus, the mediation was partial. Conclusions/Implications: Comorbidities and functional impairment can contribute directly to emotional distress; moreover, the only coping mechanism that was active in the relationship between comorbidities and distress was disengagement/denial, which exacerbated rather than mitigated distress. These results support the need to provide supportive care services for survivors to limit destructive coping in the context of comorbidities in order to improve emotional well-being.

Symposium 4B

THE PATH FROM MULTIMORBIDITY TO DISABILITY: EXAMINING PSYCHOSOCIAL MODERATION AND BIOLOGICAL MEDIATION

Dr. Elliot Friedman, PhD

Single and multiple chronic medical conditions have become more prevalent as the population of older adults has grown; by some estimates, most adults over age 60 have more than one chronic condition (multimorbidity). Multimorbidity not only presents challenges for medical management and cost of care, but it markedly increases the risk of a range of adverse health outcomes, including disability, cognitive impairment, and mortality. Importantly, however, there is variability in these outcomes among those with multimorbidity. Studies on very long-lived individuals, for example, show that multimorbidity need not compromise quality of life. Our research program seeks to better understand the factors that influence the extent to which multimorbidity results in adverse health outcomes. We focus specifically on the potential for psychosocial resources to mitigate the impact of chronic conditions as well as the potential mediating role of biological processes, notably inflammation, that have been implicated in a range of disease processes. This presentation will outline our guiding model and present results from studies examining the interactive influences of psychological well-being and inflammation on the links between multimorbidity and disability in particular. We have shown, for example, that higher ratings of eudaimonic well-being (e.g. purpose in life; fulfilling personal relationships) are linked to lower circulating levels of inflammatory proteins in general, and in those with multimorbidity specifically, compared to lower levels of well-being. Moreover, we have shown in longitudinal analyses that while multimorbidity increases later disability, greater eudaimonic well-being moderates this association. Finally, inflammation partially mediates the association of multimorbidity and later disability. As well-being in older adults appears to be modifiable, the results from this work suggest that interventions targeting well-being may have the potential to improve health outcomes across a range of chronic medical conditions and improve overall quality of life.

Symposium 4C

MULTIMORBIDITY AND PHYSICAL ACTIVITY IN ATLANTIC CANADIANS

Dr. Melanie Keats, PhD

Physical inactivity has been identified an important contributor to global chronic disease burden and as the fourth leading risk factor for mortality. Worldwide, physical inactivity is estimated to contribute to as much as 21-25% of breast and colon cancer, 27% of diabetes, and approximately 30% of ischemic heart disease burden. Given the shared lifestyle risk factors and the potential of a shared underlying biology for some diseases (e.g., inflammation), the co-occurrence of more than one chronic disease (i.e., multimorbidity) is becoming an increasing concern. While a wealth of data is available to show that physical activity is an effective preventive measure for more than 25 chronic diseases, interestingly although emerging data suggests an important dose-response relationship, much less is known about the potential role of physical activity reducing the burden of multimorbidity. Similarly, while the relationship between the presence of a chronic illness and physical activity has been reported, the impact of multiple chronic illnesses on physical activity levels has not been well described. This retrospective, population-based study will draw data from over 31,000 participants from the Atlantic Partnership for Tomorrow's Health (PATH) cohort. Atlantic PATH is part of Canadian Partnership for Tomorrow Project, a national prospective cohort study examining the influence of genetic, environmental, and lifestyle factors in the development of cancer and chronic disease. In brief, we will describe the prevalence of physical activity in individuals with a self-reported history of a chronic disease (e.g., cancer, cardiovascular disease, diabetes). We will also report the association between multimorbidity (i.e., 2 or more chronic illnesses) and physical activity levels. Implications of findings will be shared and discussed.

Symposium 5 8:00 AM-9:15 AM

DESIGNING BEHAVIORAL HEALTH TECHNOLOGIES FOR ADOLESCENTS AND YOUNG ADULTS: FINDING COMMONALITIES ACROSS PATIENT GROUPS

Emily Lattie, Ph.D.[1], Sherif M. Badawy, MD, MS, MBBCh[2], Carly M. Goldstein, PhD[3], Sarah S. Jaser, PhD[4]

[1]Northwestern University, Chicago, IL; [2]Ann & Robert H. Lurie Children¹s Hospital of Chicago, Northwestern University Feinberg School of Medicine, Chicago, IL; [3]Weight Control and Diabetes Research Center; Brown Medical School, Providence, RI; [4]Vanderbilt University Medical Center, Nashville, TN

Technology-based interventions, such as those delivered via mobile phones and online, offer the possibility to expand behavioral health treatment options and to reduce barriers to services. However, sustained long-term engagement with such interventions remains a challenge, particularly in younger age groups. Adolescents and young adults (AYA) appear to be ideal candidates for many of these technology-based interventions because they are typically digital natives and confident in their ability to access and navigate different digital interfaces. However, counter to older adults, AYA tend to view usability issues as the fault of the intervention or website and are quick to disengage when their needs and expectations are not met. For this session, we will present research examining different methods of using technology to promote healthy behaviors in AYA subgroups. The first presenter will discuss findings from a study on college student interest in and willingness to use mobile phone apps for a variety of health behaviors, and will provide tips on collaborating with technologists with designing for young adults. The second presenter will discuss her work in developing and testing a positive psychology intervention for teenagers with Type 1 diabetes delivered via text message and automated voice messages. The third presenter will share insights from his work in designing a mobile phone app to improve medication adherence and self-management in AYA with sickle cell disease. Finally, the discussant will provide a summary of these findings and lessons learned to date in designing behavioral health technologies for AYA. She will lead a discussion regarding ways to move the intervention field forward, with attention to sharing knowledge across disease/target behavior subgroups and capitalizing on the diverse expertise found in the members of the Society for Behavioral Medicine.

Symposium 5A

HU-GO APP: A NOVEL ENHANCING INTERVENTION FOR HYDROXYUREA IN ADOLESCENTS AND YOUNG ADULTS WITH SICKLE CELL DISEASE

Dr. Sherif M. Badawy, MD, MS, MBBCh

Background: Sickle cell disease (SCD) is the most common genetic disorder in the US, seen in 80-100,000 Americans. Hydroxyurea (HU) reduces morbidity, and mortality, and lowers healthcare utilization in SCD. Yet HU adherence is suboptimal. Data on the use of technology to improve HU adherence in adolescents and young adults (AYA) with SCD are limited.

Aims: (1) to determine access to smartphone technology among AYA with SCD and to identify preferred technology-based strategies for improving medication adherence; (2) to develop a smartphone app (HU-Go) to improve HU adherence using iterative user-centered design; and (3) to conduct a feasibility trial.

Methods: Part I: A cross-sectional survey was administered to AYA (12–22 yrs) with SCD. Part II: A usability phase of HU-Go app (n=5) over 4-weeks and a feasibility phase (n=15) over 12 weeks.

Results: Part I: Eighty participants completed the survey (51% female, 94% Black), and had a mean age of 15.3±2.8 years. Most owned or had access to smartphones (85%), tablets (83%), laptops (72%), or desktops (70%). The top app feature was daily medication reminders, followed by education about SCD, adherence text prompts, education about SCD medications, and medication log. Part II: Based on patients' input and our conceptual model, we were able to develop a novel multi-functional HU-Go app with personalized features as a single platform that provides patients with: a) education (SCD/HU), b) reminders for daily medications, refills and appointments, c) interactive communication with SCD team, d) community resources, and e) health tracker (medications, pharmacies, event/symptom log, quality of life, patient portal and wearable sensors). All patients approached agreed to enroll. The usability phase is ongoing, and the feasibility trial will begin in October 2016.

Conclusions: Most AYA with SCD owned or had access to smartphones or other electronic devices. The development of a multi-functional smartphone app to improve HU adherence is feasible. The feasibility trial of HU-Go will provide a "proof-of-concept" evidence for the feasibility and acceptability of a novel app-based approach to disease management that we plan to extend to AYA with other chronic conditions.

Symposium 5B

WILLINGNESS TO UTILIZE SMARTPHONE APPS FOR HEALTH INTERVENTIONS: IMPORTANT CONSIDERATIONS FOR EMERGING ADULTS

Dr. Carly M. Goldstein, PhD

Objective:

Currently, 86% of emerging adults (ages 18-29) own smartphones. This study’s purpose was to measure willingness to use smartphone applications (“apps”) to monitor or change health behaviors and common targets of behavioral interventions.

Methods:

Undergraduates (n=249) at a large, Midwestern university were recruited to complete surveys about engagement in and willingness to use apps to monitor health behaviors through an online secure-socket layer technology program.

Results:

This sample of emerging adults (19.78 ± 2.98 years; 91.2 % white; 81.9% female) were most interested in using apps to target exercise patterns, nutrition, calorie intake, stress, and overall health; they were less willing to target body image, sleep patterns, and anxiety. Higher BMI was related to willingness to use apps for overall health ($\beta = .15$, $p < .05$). Greater perceived body fatness in the lower body was related to higher willingness to use apps to monitor diet ($\beta = .14$, $p < .05$), body image ($\beta = .24$, $p < .001$), caloric intake ($\beta = .22$, $p < .01$), and overall health ($\beta = .13$, $p < .05$). Higher feelings of fatness predicted higher willingness to use apps for monitoring body image ($\beta = .29$, $p < .001$), diet ($\beta = .20$, $p < .01$), calorie intake ($\beta = .24$, $p < .01$), and exercise ($\beta = .15$, $p < .05$). More intense body loathing scores were related to willingness to use apps to monitor body image only ($\beta = .13$, $p < .05$). Worry was related to increased willingness to use apps to monitor anxiety ($\beta = .17$, $p < .05$).

Discussion:

Emerging adults’ willingness to use technology was related to numerous measurable factors within the present study. Researchers are encouraged to design interventions to match emerging adults’ willingness and needs; researchers interested in designing app-based or app-inclusive interventions should allot additional development focus to matching design intervention components uniquely tailored for this age group, their preferences, and potential factors that could improve engagement.

Symposium 5C

USING TECHNOLOGY TO DELIVER A POSITIVE PSYCHOLOGY INTERVENTION FOR ADOLESCENTS WITH TYPE 1 DIABETES

Sarah S. Jaser, PhD

The majority of adolescents with type 1 diabetes (T1D) are not meeting treatment goals, and many struggle with adherence to the intensive treatment regimen. Positive psychology interventions have been shown to improve adherence in adults with chronic illness (e.g., Charlson et al., 2010), but they have not been widely tested in pediatric populations. In our study, we adapted the protocol successfully used in adults to promote positive affect, including self-affirmations, small gifts, and gratitude, for adolescents with T1D, by increasing the frequency of contact from bi-weekly to weekly and including parental affirmations.

Adolescents with T1D (n = 120, mean age 14.8 yrs, 52.5% female, 87.5% White) were randomized to either an education (n=60) or positive affect (PA) intervention (n=60). We used automated phone calls (interactive voice technology, n = 30) and text messages (SMS, n=30) to deliver the PA reminders and to collect data on adolescents' mood during the 8-week intervention. There was a significant difference in the response rate to the weekly PA messages: only 14.3% of adolescents answered or returned phone calls, as compared to 67.5% of adolescents who responded to text messages (p<.001). The response rate to the mood assessments were not significantly different between text message (68.5% complete) vs. interactive voice technology (57.8%) groups (p = .134). Exit interviews revealed that the greatest barrier to participation was timing/inconvenience. The PA intervention had a positive effect on quality of life; adolescents in the PA group demonstrated significant improvement in quality of life at 3 months, compared to the education group (estimated mean difference = 3.9, p = .020), after adjusting for age, sex, race/ethnicity, income, depressive symptoms, pump use, and baseline measurement for each outcome. In addition, the PA group showed a trend toward improvement in adolescents' adherence (estimated mean difference = 1.2, p=.129), particularly in the text group (1.5, p=.136). The intervention had no effects on glycemic control.

The next phase of our work will be to administer the intervention solely through text messages, increasing the frequency of messages (from weekly to daily), and enhancing involvement of parents (training on parental affirmations).

Symposium 6 8:00 AM-9:15 AM

PHYSICAL ACTIVITY AND WELLNESS: IMPLICATIONS FOR INTERVENTIONS IN AGING POPULATIONS

Brenna N. Renn, PhD[1], Neha Gothe, MA, MS, PhD[2], Susan Aguiñaga, PhD[3], Elizabeth Awick, MS[4], Kelsey C. Bourbeau, MA[5], Sandra Jane. Winter, PhD, MHA[6]

[1]University of Washington School of Medicine, Seattle, WA; [2]Wayne State University, Detroit, MI; [3]University of Illinois at Urbana-Champaign, Urbana, IL; [4]University of Illinois at Urbana Champaign, Urbana, IL; [5]Wayne State Univeristy, Warren, MI; [6]Stanford University School of Medicine, Palo Alto, CA

The health benefits of physical activity (PA) are extensively documented across the lifespan. However, many aging individuals engage in low levels of PA and have an elevated risk of developing chronic diseases associated with inactivity. Understanding the benefits of PA in this population is necessary to better tailor PA interventions and engage individuals in behavior change. In this symposium, presenters will describe data regarding PA among aging adults in the context of wellness and quality of life (QoL), with special attention to implications for behavioral interventions. The first presenter will discuss perceived benefits and affective experience of PA in midlife, which is an age group that represents a key developmental time point for improving health and preventing age-related chronic disease processes associated with physical inactivity. Her data provide a foundation to further investigate motives for PA among aging individuals to inform interventions and improve wellness. The second speaker will present data from an exercise intervention for older adults in which PA improved global QoL indirectly by reducing distress. The presenter conceptualizes distress broadly (i.e., anxiety, depression, perceived stress, and disturbed sleep) and will underscore the importance of these variables in PA interventions for greater well-being in older adults. The third presenter draws on findings from a Latin dance program for Spanish-speaking older adults with mild cognitive impairment. While she noted improved physical function during the course of the intervention, such improvements were also observed in wait-list participants receiving other services in an enriched adult day center environment. She will present her findings in the context of implications for future interventions with this population who have increased risk of chronic disease. Finally, the fourth speaker will discuss how PA contributes to physical functioning in older adults who have suffered a stroke. Her findings, based on objectively measured activity levels, suggest that both light and moderate-to-vigorous activity play an important role in functional ability in this vulnerable population. The discussant will comment on these findings and initiate a discussion from the perspective of health promotion interventions among older adults. Together, these presentations highlight the importance of PA promotion as part of general wellness and QoL in aging.

Symposium 6A

PERCEIVED BENEFITS AND OUTCOME EXPECTATIONS OF PHYSICAL ACTIVITY IN MIDLIFE

Dr. Brenna N. Renn, PhD

Midlife represents a key time point for engaging in behaviors to promote health and forestall age-related chronic disease. Physical activity (PA) is one such behavior of interest. However, adults become less active with age, and there is a scarcity of literature examining psychological factors associated with PA in middle-aged adults. Social cognitive theory (SCT) highlights the role of outcome expectations in both the adoption and maintenance of PA, but little attention has been paid to such influence in middle age.

The present study examined cross-sectional outcome expectations of PA in 195 middle-aged adults (M_{age} = 58.29±4.15 years, range 50-64 years, 65.6% female, 9.4% ethnic minority) recruited from community settings. Primary outcomes were the Exercise Benefits/Barriers Scale (EBBS) and Physical Activity Enjoyment Scale (PACES). Physical activity was assessed using the short-form International Physical Activity Questionnaire (IPAQ-SF). Additional SCT variables of self-efficacy and self-regulation were assessed.

Less than half (43.1%) of the sample reported activity consistent with national guidelines (150 min/week of moderate-to-vigorous PA [MVPA]). Although the majority of the sample was aware of the benefits of regular PA, individuals who reported ≥ 150 min/week of MVPA perceived significantly more benefits of activity than their less active counterparts, $F(1, 182) = 35.61$, $p < .001$, $\eta_p^2 = .16$. Those meeting MVPA guidelines also reported higher levels of enjoyment associated with PA, $F(1, 182) = 47.89$, $p < .001$, $\eta_p^2 = .21$. Both active and sedentary respondents perceived physical fitness benefits from PA, including improved cardiovascular functioning and muscle strength. However, those who reported meeting MVPA guidelines were more likely to perceive psychological benefits of PA, such as decreased stress, improved mental health, sense of personal accomplishment, and improved well-being (ps < .001). After controlling for total activity levels, greater enjoyment of PA (beta = .47, $p < .001$) and greater use of goal-setting strategies for PA (beta = .24, $p = .002$) predicted greater perceived benefits of PA.

Causal inferences are limited by the cross-sectional methodology, but these data suggest that appreciating both physical and psychological benefits of PA are associated with higher levels of MVPA. Given the importance of outcome expectations in predicting engagement in PA, future research should explore how best to leverage or modify such outcome expectations. Identifying and addressing how to increase perceptions of benefits and enjoyment of PA may lead to more effective interventions and sustained behavior change among aging individuals.

Symposium 6B

IMPACT OF A LATIN DANCE PROGRAM ON PHYSICAL ACTIVITY AND PHYSICAL FUNCTION IN OLDER LATINOS WITH COGNITIVE IMPAIRMENT

Susan Aguiñaga, PhD

Older Latinos have a greater risk of developing chronic conditions involving modifiable disease factors in comparison to non-Latino whites. Presence of these chronic diseases, compounded with poverty, may increase the risk of mobility disability for this population. Physical activity (PA) has been shown to improve chronic diseases and may protect against mobility disability. Unfortunately, older Latinos participate in low levels of leisure-time PA. Thus, the purpose of this study was to examine the impact of a Latin dance program on PA and physical function among older Latinos with mild cognitive impairment (MCI) attending an adult day center. Spanish-speaking older Latinos [N=21, 75.4 ± 6.3 years old, 76.2% female, 22.4± 2.8 MMSE score] were randomized into a 16 week, twice-weekly dance intervention or to a wait-list control group; the wait-list control group received the dance intervention at week 17. Participants were given a waterproofed ActivPal inclinometer to wear on their non-dominant thigh for 7 consecutive days. Physical function was assessed using the Late-life function and disability instrument (LLFDI), Short Physical Performance Battery (SPPB), and the Timed up and go (TUG). Data was collected at baseline, month 2, 4, 6, and 8. Repeated measures ANOVA were used to determine overall time effect and time x group interaction effects. We calculated Cohen's *d* values as an estimate of the effect sizes. Results revealed no significant time or interaction effects for light or moderate-vigorous PA as measured by the ActivPal, and no effects for the LLFDI. There was a time effect for the chair stand component of the SPPB, *F* (2, 38) = 10.02, *p*= .001, d= .83, and the TUG, *F* (2, 38) = 8.27, *p* = .001, *d* =.74. These results suggest that a Latin dance program for older Latinos with MCI has modest effects on physical function, but not more so than a wait-list control group. Whether improvement was due to our intervention or due to the enriched adult day center environment, these changes may be clinically meaningful for this population. Researchers interested in this population should consider conducting research with older Latinos with MCI who are not attending adult day centers in order to determine if PA interventions are efficacious among individuals who do not have access to these centers.

Symposium 6C

PHYSICAL ACTIVITY, DISTRESS AND QUALITY OF LIFE IN OLDER ADULTS: A PANEL MODEL

Elizabeth Awick, MS

Physical activity has been consistently and significantly associated with improved life satisfaction in older adults. However, less is known about the mediating effects of changes in distress on this relationship, specifically within the context of an exercise intervention. The purpose of the present study was to examine how changes in moderate to vigorous physical activity (MVPA) and distress influenced changes in quality of life (QOL) in older adults across a six-month period. Community-dwelling older adults (N=247, M age=65.39) were recruited to participate in a six-month randomized controlled exercise trial designed to examine cognition and brain function. Participants wore accelerometers to measure MVPA and completed measures of psychological health outcomes and QOL at baseline and after the intervention, six months later. Distress was defined as a latent composite of self-reported measures of anxiety, depression, sleep disturbance, and perceived stress. In a panel model, parallel changes in MVPA, distress, and QOL during the six-month intervention were estimated as latent change scores, including constraints for measurement invariance over time. The hypothesized model provided excellent fit to the data (χ^2=62.099(53), *p*=.184, RMSEA=.026 [90% CI=.000, .050], CFI=.992, TLI=.990, SRMR=.037). Overall, individuals with greater increases in average daily MVPA over the intervention period demonstrated significantly reduced distress from baseline to 6 months (β = -.18, *p*<.05). In turn, individuals with greater reductions in distress across the intervention reported significantly greater increases in QOL from baseline to 6 months (β = -.30, *p*<.001). Reductions in distress partially explained the benefits to QOL from increased MVPA [indirect effect = 0.05; bias-corrected bootstrapped 95% CI=.005, .125]. These findings suggest that several domains of psychological health (e.g., anxiety, depression, sleep disturbance, stress) may play an important role in the influence of physical activity behavior change on global life satisfaction. Future research should target such psychological factors in concurrence with physical activity behavior for greater improvements in well-being in an aging population.

Symposium 6D

RELATIONSHIP BETWEEN LIGHT PHYSICAL ACTIVITY AND FUNCTIONAL FITNESS IN STROKE SURVIVORS

Kelsey C. Bourbeau, MA

Purpose:

Impairment caused by stroke is a major cause of disablement in older adults. Loss of physical function often results in a decreased ability to perform activities of daily living. Physical activity has been shown to improve physical functioning, however little research has been done to explore how activities of different intensities may affect functional fitness outcomes in stroke survivors. The purpose of this study was to examine the relationship between physical activity and self-reported and objective functional fitness measures in this population.

Methods:

Stroke survivors (N=30, Mean age=61.77±11.17) completed the Short Physical Performance Battery (SPPB) and the Late-Life Function and Disability Instrument (LLFDI). Physical activity levels were measured objectively using a 7-day Actigraph accelerometer wear period and scored using the Copeland cutoffs for sedentary (counts/minute ≤50), light (counts/minute <1,041), and moderate to vigorous (MVPA; counts/minute ≥ 1,041) activity.

Results:

Light activity significantly correlated with total SPPB score (r= .390 p=.033). Light activity also significantly correlated with several subscales of the function component of the LLFDI, including: basic lower extremity (r= .490, p=.006), advanced lower extremity (r= .568, p=.001), upper extremity (r= .465, p=.010) and total function (r= .585, p=.001). MVPA significantly correlated with total SPPB score (r= .491, p=.006), and the LLFDI including: advanced lower extremity subscale (r= .443, p=.014) and total function (r=.380, p=.038).

Conclusion:

These findings suggest that light activity and MVPA may contribute to better physical functioning in stroke survivors. While MVPA had a greater association with objective measures of physical function, light activity displayed greater significant correlations across all subscales of the self-reported function component of the LLFDI than MVPA. Disabilities resulting from stroke may limit this population from engaging in MVPA, and these findings highlight the importance of light physical activity, which may offer similar functional benefits. Future studies should focus on development of effective exercise interventions for stroke survivors by incorporating not only MVPA but also light intensity physical activities.

Symposium 7 8:00 AM-9:15 AM

LOCAL AREA HEALTH ASSESSMENT: COLLECTING ACTIONABLE DATA FOR PLANNING, RESEARCH AND INTERVENTIONS

Richard P. Moser, PhD[1], Kate Brett, PhD[2], John M. Boyle, PhD[3], Kelly D. Blake, ScD[4], Bradford Hesse, PhD[5]

[1]National Cancer Institute, Bethesda, MD; [2]National Center for Health Statistics/CDC, Hyattsville, MD; [3]ICF International, Rockville, MD; [4]Division of Cancer Control and Population Sciences, National Cancer Institute, National Institutes of Health, Bethesda, MD; [5]National Cancer Institute, Rockville, MD

Increasingly, health systems such as cancer centers and other hospitals are being held responsible for assessing and improving the health of people in their local catchment areas, not just those patients who walk in their doors. These data can be used by providers, planners and health researchers to improve the health of a local area, however defined, and ultimately contribute to improved public health. In order to accurately assess these needs at a local level, however, relevant and precise data are needed. Having these precise and accurate data are critical as national data will not contain the detailed information to identify the needs of a local area such as a state, county, city or even a neighborhood. These local data can then be compared with results from national health-related surveillance systems, such as the Health Information National Trends Survey (HINTS), to identify and understand the needs and potential unique health disparities of a local area. These health concerns, for example, may include understanding rates of behaviors such as use of tobacco products including combustible cigarettes and e-cigs, HPV vaccination rates, preferred health communication media channels and other health-related knowledge, perceptions and attitudes. Data from these local assessments can potentially be disaggregated to understand and target the needs of important racial/ethnic subgroups or other under-represented groups, and together, be used to improve local and larger population health outcomes. This symposium will present several efforts to perform local area health assessments including: 1) a measurement framework to support community health; 2) research using non-probability survey collection methods to assess health outcomes for local geographic areas; and 3) a description of health assessments being done in cancer center catchment areas. These health assessments are critical and can provide researchers, providers, coalitions and local planners with important information to stimulate hypothesis-driven research, better characterize local disparities and inequities and develop appropriate evidence-based interventions.

Symposium 7A

A MEASUREMENT FRAMEWORK FOR COMMUNITY HEALTH AND WELL-BEING: REPORT ON BEHALF OF THE NATIONAL COMMITTEE ON VITAL AND HEALTH STATISTICS

Dr. Kate Brett, PhD

As healthcare pivots toward greater accountability for population health, professionals in behavioral medicine are being called upon to design and implement actionable programs for disease prevention and health promotion. This shift takes place at a time many communities are driving to achieve health equity. Despite many increasingly favorable conditions, communities have articulated their ongoing struggle with barriers that make it difficult for them to work effectively with data to decide where and how to intervene. Although a host of indicators and metrics exists, there is a shortage of sub-county data, compounded by other data gaps and by issues with timeliness, standardization, analytic capacity, and data stewardship. More fundamentally, many communities remain uncertain about precisely what they should measure, given the multitude of health determinants. On September 27 2016, the Population Health Subcommittee of the National Committee on Vital and Health Statistics convened a daylong workshop to promote multi-sector approaches for improving community health and well-being. In this symposium, the lead staff member of the Subcommittee will provide SBM conference attendees an in-depth report on the conclusions and follow-up actions reached by members of the subcommittee. Topics to be covered will include:
(a) status of a multi-sector measurement framework to serve as the basis for a public/private collaboration at the community-level; (b) opportunities and gaps in sub-county level data metrics; (c) opportunities to align, leverage, and build multi-sectoral sub-county level metric-centric efforts to improve health and well-being; and (d) report on collaborative efforts to continue work in this arena.

Symposium 7B

USING NON-PROBABILITY SURVEY DATA COLLECTION METHODS TO ASSESS HEALTH NEEDS, BEHAVIORS AND OUTCOMES FOR LOCAL GEOGRAPHIC AREAS

John M. Boyle, PhD

Most public health programs are implemented and evaluated at the community level, but few public health surveillance systems generate community measures. National health surveys lack the sample size to provide estimates at the community level. Local area health surveys could enhance the information needed by researchers, providers and planners to assess intervention needs and program outcomes at the local level. However, costs for traditional probability surveys have been a barrier to adoption of community health surveys.

Non-probability samples provide a low cost and quick turnaround alternative to traditional probability samples for local area assessments. Non-probability samples are not based on statistical models that permit variance estimates and confidence intervals about their estimates. However, they are not necessarily inferior to probability samples in other aspects of total survey error. They are commonly used in evaluations, including clinical trials.

In this paper, we will describe the methods used in several recent surveys we have conducted using non-probability web panels and results related to health needs, behaviors and outcomes. This information includes health status, exercise, height, weight, tobacco use, doctor visits, screening tests, and other health-related knowledge, attitudes, beliefs and behaviors. We also tested respondents' willingness to use new technology, like smartphones to take pictures of their health records and their willingness to share their electronic health records with health agencies.

Symposium 7C

POPULATION HEALTH ASSESSMENT IN CANCER CENTER CATCHMENT AREAS

Dr. Kelly D. Blake, ScD

The National Cancer Institute (NCI) recently announced the opportunity for supplemental funding to conduct research to better characterize the populations and communities within the NCI-designated cancer center catchment areas. Supplemental funding was provided to 15 cancer centers to enhance their capacity to acquire, aggregate and integrate data from multiple sources, as well as plan, coordinate, and enhance catchment area analysis activities, including reviewing and selecting measures and planning a strategy for enhancing data collection in the catchment area. The short-term goal is to conduct local research to better define and describe the cancer center catchment area using a multilevel population health framework. The long-term goal is to facilitate collaborations in which local area providers, public health practitioners, policymakers, and nonprofit organizations can utilize data to develop or expand applied cancer control research, planning, intervention, and implementation efforts, with particular attention to local level health disparities and communication inequalities. Although there are several national level, public use datasets for health behavior research, national surveillance vehicles such as HINTS, BRFSS, and NHIS do not collect a large enough sample at smaller geographic units to be optimally useful at the local level for targeted outreach, intervention planning, clinical trials recruitment, and patient engagement. A number of methodological questions remain as to the feasibility of using small area samples to complement data streams embedded within national surveys. How do small area estimates compare to national estimates? How do nonprobability samples compare to random samples in terms of bias, error, coverage, and reliability? Can bias in local data be overcome by calibrating estimates to national anchors? The research funded by NCI's population health assessment initiative will help to answer these methodological questions, and by so doing should improve the viability of aggregating local and national data to inform local needs assessment and planning in cancer prevention and control. We will report on innovative data collection methods being used across the funded sites, as well as common constructs and measures that will be used for local and national comparisons.

Symposium 8 8:00 AM-9:15 AM

CONTEXTUALIZING HEALTH BEHAVIORS AND OUTCOMES: THE ROLE OF GEOGRAPHY

Jennifer L. Moss, PhD[1], Kevin Cassel, DrPH, MPH[2], Natalie Colabianchi, PhD[3], S. Bryn Austin, ScD[4], Rebecca E. Lee, PhD[5]

[1]National Cancer Institute, Bethesda, MD; [2]University of Hawaii Cancer Center, Honolulu, HI; [3]University of Michigan, Ann Arbor, MI; [4]Boston Children's Hospital, Boston, MA; [5]Arizona State University, Phoenix, AZ

Behavioral medicine has traditionally focused on intrapersonal determinants of health risks and outcomes. Increasingly, however, researchers have placed more emphasis on the role of geography in contextualizing health behaviors. Geographic disparities in health reflect variation in factors such as norms, sociodemographics, access, and the built environment, which can have direct effects on health or can be mediated through individual-level constructs. Understanding the influence of neighborhoods, communities, and environments on health behaviors is important for developing messages and interventions that can effectively promote public health. A variety of data collection and analytic techniques are available for researchers interested in studying geography and health. In this symposium, we propose to present three studies that illustrate the breadth of opportunity for incorporating geographic perspectives into health behavior research. First, Speaker 1 will discuss research on childhood obesity that examines the role of the built environment across 130 U.S. communities. Next, Speaker 2 will present results from a geographic information systems (GIS) analysis of census block groups that have higher-than-expected numbers of tanning salons across seven large cities in the U.S. Then, Speaker 3 will describe findings from an in-depth analysis of the role of social and community factors for health behaviors and well-being among residents of a designated Hawaiian home land. Finally, the Discussant will integrate findings and themes from these presentations and suggest directions for future innovations in this field of research. This symposium will highlight creative analyses of how geography contextualizes a variety of health behaviors and outcomes and will consider implications for future behavioral medicine research studies.

Symposium 8A

THE PAPAKOLEA HAWAIIAN HOMESTEAD COMMUNITY HEALTH SURVEY

Dr. Kevin Cassel, DrPH, MPH

In an effort led by Prince Kalanianaole, Congress passed the "Hawaiian Homes Commission Act" (HHCA) in 1921, which set aside 200,000 acres in Hawaii as a land trust for Native Hawaiians. This trust was recompense for the U. S. siege of Crown lands in 1893. The HCCA was established to help Hawaiians maintain traditional ties to their land and grow culturally important crops. Today, many homesteads are located in lower socioeconomic areas associated with poor health outcomes. However, there has not been a comprehensive health assessment of Hawaiian homesteads and their unique geographical locations.

Papakōlea, Kewalo and Kalawahine are neighboring homesteads, jointly referred to as “Papakōlea”, established in 1934 in Honolulu. It is the only homestead location chosen by Hawaiians. In 2014, Papakolea’s community-based organization, Kula no na Poe Hawaii, expanded a partnership with the University of Hawaii to assess the health of residents. The information was intended to inform programs to address the community’s health needs.

In 2015, a survey was developed, pilot-tested, and mailed to 390 lessees and/or residents in Papakolea. The survey consisted of five sections, including questions on: 1) Demographics - age, ethnicity, education, income and household size; 2) Health Status - diagnosis of hypertension, cancer, diabetes, and other medical conditions; 3) Health Behaviors – diet and physical activity; 4) Cancer Screening - mammography, Pap , prostate, and colorectal tests; 5) Psychosocial Factors - life satisfaction, flourishing

In all 124 surveys (32%) were completed. Most respondents were ages 50 to 70 (55%), female (72%), and Native Hawaiian (99%). Many residents (35%) reported very good or excellent health, 35% good health, and 26% poor or fair health. More residents reported poor health than that reported by the general population (15%) and Hawaiians statewide (19%). Most residents (56%) reported hypertension. Cancer screening data indicated most residents were screened for colon cancer (72%), had Pap testing (97%) and mammography (99%).

The Papakolea Hawaiian Homestead Community Health Survey was one of the first health assessments of a Hawaiian homestead. The survey provided important data on residents’ health status, identified strengths, including high rates of cancer screening and areas needing interventions. The survey provides a model for the planned assessment of 30,855 residents in 49 Hawaiian homestead communities across 7 islands.

Symposium 8B

THE BUILT ENVIRONMENT AND CHILDHOOD OBESITY: THE HEALTHY COMMUNITIES STUDY

Dr. Natalie Colabianchi, PhD

The built environment has been shown to have an important influence on childhood obesity. For children, built environment characteristics of the street segment on which they live may be an important influence on their weight status. This study documented five different street segment characteristics using an in-person audit tool for 3,600 children in 130 communities. Specifically, presence of litter, residential quality, presence and quality of sidewalks, street type (e.g., major/moderate busy thoroughfare) and presence of burned up/abandoned houses were examined. In addition, an index was created that combined these 5 items. Body Mass Index (BMI) was calculated from objectively measured height and weight and converted to BMI z-scores. Two separate linear mixed models were used to examine the association between 1) the individual street segment attributes and BMI z-score and 2) the overall street segment index and BMI z-score. Both models controlled for age, gender, race, ethnicity, family income, parental BMI, and community poverty rate, and adjusted for the clustering of participants within communities. The sample was between the ages of 4 and 15. Forty-five percent of the sample identified their ethnicity as Hispanic (via parental report). Two-thirds of the sample identified their race as White while 22% of the sample identified their race as African-American. About 50% had a family income under $35,000. The sample was nearly split between boys and girls. When the five individual street segment components were examined in the same model, street type was significantly associated with BMI z-score (p=.04) after controlling for the other covariates. Those who lived on streets that were not major/moderate busy thoroughfares had lower BMI z-scores relative to those who did live on those types of streets. The overall index of street characteristics was significantly associated with BMI z-score in adjusted models (p=.01) with those who had more favorable street segment characteristics having lower BMI z-scores. These findings highlight the role the built environment plays on childhood BMI, in particular the area near their home.

Symposium 8C

PREDICTING SPATIAL DISTRIBUTION OF BUSINESSES OFFERING UV INDOOR TANNING ACROSS SEVEN U.S. METRO AREAS

Dr. S. Bryn Austin, ScD

Introduction: Societal appearance ideals drive consumer demand for UV indoor tanning, which now generates approximately $3 billion in revenue annually in the US. The rapid growth and infiltration of UV tanning into other industries (e.g., gyms) has been followed by a corresponding rise in melanoma. While proximity to businesses offering UV tanning is likely an important predictor of use by consumers, little is known about their geographic distribution. **Methods**: In fall 2014 and 2015, we gathered phone survey data on whether businesses offered UV tanning from 21,387 businesses in 7 major U.S. metro areas (Boston, NYC, Chicago, Seattle, LA, Dallas, Miami). We then linked business survey data to block group characteristics (sociodemographics, land use, presence of businesses of all categories) to build multivariable logistic regression models to predict probability of businesses offering UV tanning. We generated predictive maps of the spatial distribution of these businesses. **Results**: UV indoor tanning services were reported in the highest prevalence by tanning salons (90.2%), health clubs (17.3%), gyms (10.8%), and laser-treatment and tattoo-removal businesses (both 8.0%). The probability of UV tanning services in a block group was positively associated with percent of population of white race/ethnicity (p<0.01) and higher density of businesses (p<0.05) and negatively associated with percent of population with college degree (p<0.05). Sunbelt metro areas (Miami, Dallas, LA) had lower prevalence of businesses offering UV tanning compared to northern areas (p<0.01 for all 3 metros). **Discussion**: We observed important variability in spatial distribution of UV tanning. Presence of these noxious services may both normalize UV tanning as a societally valued behavior and increase use by nearby residents. Societal idealization of tanned skin, particularly in populations of white race/ethnicity with lower education in northern cities, fuels demand for UV indoor tanning, putting consumers at elevated risk for melanoma.

Symposium 9 8:00 AM-9:15 AM

ONE SIZE DOESN'T FIT ALL: TAILORING INTERVENTIONS TO ADDRESS INDIVIDUAL VARIABILITY IN TREATMENT RESPONSE

Christine Pellegrini, PhD[1], Allison J. Carroll, M.S.[2], Jessica Unick, PhD[3], Michelle Drapkin, PhD[4], Angela Fidler Pfammatter, PhD[2]

[1]University of South Carolina, Columbia, SC; [2]Northwestern University Feinberg School of Medicine, Chicago, IL; [3]Warren Alpert Medical School at Brown University, Providence, RI; [4]Rutgers, The State University of New Jersey, New Brunswick, NJ

There are many established treatment approaches for improving health behaviors; however, even the most effective programs are unlikely to improve behaviors across all participants. While most programs adopt a “one size all” approach, adapting interventions based on individual treatment response and adherence may be a more promising and cost-effective approach. This symposium highlights the need to develop interventions that account for variability in treatment response across multiple health behaviors. Additionally, speakers will present potential approaches to target or adapt interventions to address this individual variability in response. The first presenter will present the results from a systematic review and meta-analysis evaluating the response to various smoking cessation treatments among smokers with a history of depression, and discuss potential opportunities to develop targeted treatment for these high-risk smokers. The second presenter will describe a preliminary study exploring the effect of providing additional support to individuals who are not responding early to an internet-delivered weight loss intervention. The results suggest that identifying early non-responders and providing additional support can enhance adherence and weight loss outcomes over a 3 month period of time. Finally, the third presenter will present two sequential multiple assignment randomized trials (SMART) which examine whether offering patients who are not engaged or drop out of treatment for substance abuse disorders improve outcomes. Engagement and the results from making additional outreach or providing choices to patients not engaged will be presented. The discussant will provide an overview on individual variability in the response to treatment across several health behaviors, collectively integrate the findings from the three presentations, and highlight evolving challenges and future directions related to the development and implementation of adaptive interventions.

Symposium 9A

DO ANTIDEPRESSANT SMOKING CESSATION TREATMENTS PRODUCE THE BEST OUTCOME FOR DEPRESSED SMOKERS?

Allison J. Carroll, M.S.

Background: In a prior systematic review and meta-analysis (Hitsman et al. 2013 Addiction), past major depression (MD) was associated with 17% and 19% lower odds, respectively, of short- and long-term abstinence. Using the same database, this study examined whether antidepressant smoking cessation treatments produce the best outcome for past MD smokers. Methods: For each study in our 2013 meta-analysis (N=42), we coded the highest-level experimental arm and the lowest-level placebo/alternative control arm for psychological and pharmacological components. Four factors were coded: 1) standard behavioral treatment (none, self-help, face-to-face); 2) cognitive behavioral mood management (CBMM; none, self-help, face-to-face); 3) standard cessation pharmacotherapy (none, placebo, nicotine replacement therapy [NRT], other); 4) and antidepressant cessation pharmacotherapy (none, placebo, varenicline, serotonergic, catecholaminergic). We used Generalized Estimating Equations, with study ID as the cluster identifier, to predict short- (≤3 months) and long-term abstinence (≥6 months) using the coded treatment components. For the analysis of long-term abstinence, we included separate terms to distinguish standard (Results: Short-term abstinence (N=30, n=2,604) was significantly increased by CBMM face-to-face (6 arms; odds ratio [OR]=2.04), NRT (21 arms; OR=2.86), catecholaminergic medication (11 arms; OR=1.36), and varenicline (2 arms, OR=2.92). For long-term outcomes (N=35, n=2,836), only catecholaminergic medication (14 arms; OR=1.49) and varenicline (2 arms, each 12-week duration; OR=2.49) improved abstinence. Neither CBMM (6 arms) nor NRT (22 arms) had an effect on long-term abstinence. Conclusion: Varenicline was shown to provide the greatest long-term benefit for smokers with past MD, more than doubling long-term abstinence rates. However, a novel, targeted behavioral treatment model may be needed to produce sustained smoking cessation among these high-risk smokers.

Symposium 9B

EARLY INTERVENTION AS A TREATMENT APPROACH FOR ADDRESSING VARIABILITY WITHIN BEHAVIORAL WEIGHT LOSS PROGRAMS

Jessica Unick, PhD

A large degree of individual variability in response to behavioral weight loss (WL) programs is consistently observed. Intensive lifestyle interventions have been shown to elicit a ≥10% WL in approximately one-third of participants, while an additional one-third of participants fail to achieve a clinically significant WL (i.e., <5% WL). Thus it is important to understand factors which contribute to this variability and develop tailored interventions targeting those with a poor likelihood of success. This presentation examines the variability in response to both in-person and Internet-based WL interventions and discusses early non-response (i.e., 4-week WL) as a potential target for improving overall treatment outcomes and increasing the proportion of individuals achieving a clinically significant WL. Preliminary data will be presented from a randomized trial comparing WL and treatment adherence among those receiving a 12-week Internet-based WL program (IBWL; n=50) to those receiving the same Internet program plus the possibility of extra support (IBWL+ES; n=50). The only difference between the two treatment conditions was that participants in IBWL+ES with a 4-week WL d=0.84). Further, those 'early non-responders' receiving additional support viewed significantly more video lessons (p=0.02, Cohen's d=0.91) and had better self-monitoring adherence (p=0.06, Cohen's d=0.87) compared to IBWL 'early non-responders'. These preliminary data suggest that individuals at risk for poor WL success following treatment may be able to be 'rescued' if intervened upon early. Additional studies are needed to determine whether this improved adherence and altered WL trajectory observed with early intervention leads to a greater proportion of individuals achieving clinically significant WL at longer follow-up periods. Investigations into whether this stepped-care approach is also beneficial from a cost-effectiveness perspective are warranted.

Symposium 9C

SEQUENTIAL MULTIPLE ASSIGNMENT RANDOMIZED TRIAL (SMART) ADAPTIVE STUDIES FOR SUBSTANCE USE DISORDERS (SUD)

Dr. Michelle Drapkin, PhD

Individuals with substance use disorders (SUD) have limited options for and mixed experiences with treatment. High dropout rates are common. In these studies we examined several research questions using a sequential multiple assignment randomized trial (SMART): Does offering patients who do not engage in treatment a choice of other interventions improve outcomes? Does offering patients who engage but then drop out a choice of other interventions improve outcomes? Does a second attempt to offer treatment choice to non-engagers improve outcomes? A SMART design enabled us to examine an alternative option with greatest chance of success for patients who do not engage while at the same time recognizing that there will still be some patients who remain disengaged after. Sequential randomization is needed to address these goals. In this presentation we will review the study design and findings and discuss the unique aspects of two SMART trials. Participants recruited from intensive outpatient (IOPs) in publicly funded and VA programs. One study recruited individuals who were cocaine dependent (N=300), 80% with past or current alcohol dependence; the other recruited individuals who were alcohol dependent (N=200), 40% with past or current cocaine dependence. Participants were randomized to two engagement strategy interventions, both using Motivational Interviewing (MI) delivered over the phone: one used MI to help participants re-engaged in the IOP; the other used MI to provided choices for treatment (IOP, medication, individual cognitive behavioral therapy (CBT), or telephone monitoring and adaptive counseling). By the second week of the treatment, 37-38% of the samples were no longer engaged; before the eighth week, an additional 20-23% had disengaged. Our findings indicated that there was not an advantage to providing outreach and a choice of interventions to patients who engage initially but then drop out. Providing further outreach with a choice of interventions to those not engaged at two and eight weeks did not improve SUD outcomes compared to no further outreach. We will discuss the main effect analyses and implications in this presentation.

SLEEP INTERVENTIONS IN CHRONIC ILLNESS POPULATIONS

Kelly Glazer. Baron, PhD, MPH, CBSM[1], Michelle Drerup, PsyD[2], Christina McCrae, PhD[3], Patricia Haynes, PhD[4]

[1]Rush University Medical Center, Chicago, IL; [2]Cleveland Clinic, Cleveland, OH; [3]University of Missouri-Columbia, Columbia, MO; [4]University of Arizona, Tucson, AZ

There is a large literature demonstrating the relationship between sleep disruption and a variety of health conditions including neurologic health, chronic pain and cardiometabolic disorders. Furthermore, there are several well established and highly effective behavioral sleep interventions for sleep disorders which are known to improve sleep and quality among patients with chronic illness. However, less is known about the application of sleep interventions to prevent and treat medical disorders and mechanisms driving those effects. The focus of this symposium will be to identify sleep interventions tested in three chronic illness populations (neurologic disorders, chronic pain and cardiometabolic disorders), discuss how interventions such as cognitive behavioral therapy for insomnia (CBT-I) have or have not been adapted for use among patients with chronic illness and discuss how sleep interventions have affected clinical outcomes or disease process. The first presentation will discuss applications of CBT-I to MS and Parkinson’s Disease (Dr. Drerup). The second presentation will discuss CBT-I in chronic pain populations (Dr. McCrae). The third presentation will discuss the role of improving sleep duration and quality in patients with cardiometabolic disorders. Dr. Haynes will serve as the discussant and integrate the presentations, discussing current challenges and opportunities for future research in sleep interventions among chronic illness populations.

Symposium 10A

SLEEP INTERVENTIONS IN CARDIOMETABOLIC DISORDERS

Dr. Kelly Glazer. Baron, PhD, MPH, CBSM

Short sleep duration and poor sleep quality have been associatiated with increased risk for cardiovascular disease, hypertension and diabetes. However, few studies have evaluated sleep interventions to reduce risk for cardiometabolic disorders. Sleep may represent a modifiable risk factor for these conditions. Several proposed pathways have been explored including indirect pathways (role of sleep in influencing diet and physical activity) and direct pathways (e.g. sympathetic nervous systems activity). The presention will demonstrate the association of sleep duration and timing with diet and physical activity. In addition, a novel intervention to extend sleep duration among individuals with short sleep duration and prehypertension will be presented.

Symposium 10B

TREATMENT OF INSOMNIA AMONG PATIENTS WITH NEUROLOGIC DISORDERS

Dr. Michelle Drerup, PsyD

The incidence of sleep problems in individuals with neurological disorders, including multiple sclerosis and Parkinson's disease, has been estimated to be 3-5 times higher as compared to the general population. Sleep disorders such as insomnia in individuals with neurological conditions are often underdiagnosed and undertreated, oftentimes misunderstood as other symptoms of the disorder such as fatigue. Initial research suggests that Cognitive Behavioral Therapy for Insomnia (CBT-I) may be an effective clinical intervention for individuals with neurological disorders but minimal research to date has been done looking at this behavioral intervention in this specific population. Recent data will be reviewed including a retrospective case analysis of individuals who underwent CBT-I (individual or group modality) who demonstrated improvements in insomnia symptoms, increased self reported total sleep time, as well as decreased fatigue and depression ratings. In addition, pilot data exploring the feasibility and outcomes of using a web-based CBT-I intervention in individuals with Parkinson's disease comorbid with insomnia will be reviewed.

Symposium 10C

SLEEP INTERVENTIONS IN PATIENTS WITH FIBROMYALGIA

Christina McCrae, PhD

Fibromyalgia (FM) is a prevalent and costly chronic pain condition. FM sufferers experience high rates of insomnia and fatigue. Targeting and improving pain, insomnia, and related symptoms (I.e., mood, fatigue) in these patients can be challenging. Cognitive behavioral therapy (CBT) holds great promise, because it can be designed to target multiple symptoms. Recent trail data comparing the impact of CBT for insomnia (CBT-I) to CBT for pain (CBT-P) on sleep, pain, fatigue, and mood in patients with comorbid fibromyalgia and chronic insomnia will be reviewed. Pilot data examining the impact of a hybrid CBT-PI on those same patient centered outcomes will also be presented.

Symposium 11 8:00 AM-9:15 AM

MHEALTH TECHNOLOGY TO IMPROVE MEDICATION ADHERENCE

Janet DeMoor, PhD, MPH[1], Michael J. Stirratt, PhD[2], Karen B. Farris, PhD[3], Frank A. Treiber, PhD[4], William Riley, PhD[5], Sara Browne, MD, MPH[6]

[1]National Cancer Institute, National Institutes of Health, Rockville, MD; [2]NIMH Division of AIDS Research, Bethesda, MD; [3]University of Michigan College of Pharmacy, Ann Arbor, MI; [4]Medical Univ of South Carolina, charleston, SC; [5]National Institutes of Health, Bethesda, MD; [6]Division of Infectious Diseases, University of California, San Diego, San Diego, CA

Recent years have seen exponential growth in the use of mobile health (mHealth) technologies to address medication adherence. Various examples include electronic monitoring of prescription refills, wireless electronic drug monitors, pills that wirelessly detect/report drug ingestion, and cellphone text messaging (SMS) and smartphone/tablet-based programs to promote medication adherence. These technologies provide novel capacities for active monitoring of adherence behavior, improved delivery of medication adherence reminders, patient-centered education on medication and requirements, provision of feedback to and from patients and providers, and individually-tailored adherence and monitoring interventions. The symposium will feature three examples of mHealth approaches for supporting medication adherence and explore how these approaches contribute to advancing the science of medication adherence. The first presentation will discuss how ingestible sensors can be used to monitor adherence to diabetes treatment. The second presentation will explore how artificial intelligence and text messages can improve medication adherence among adults with uncontrolled hypertension. The third presentation will examine how mHealth technology can improve medication management among individuals with chronic illness. Following the three presentations, a discussant will review the major outstanding knowledge gaps that need to be addressed as well as the barriers and drivers to incorporating mHealth tools into clinical practice.

Symposium 11A

MHEALTH TECHNOLOGY TO IMPROVE MEDICATION ADHERENCE

Professor Karen B. Farris, PhD

Mobile health (mHealth) strategies including SMS may improve medication adherence, yet most are based on deterministic protocols with programmed responses. We propose a model medication adherence system using Reinforcement Learning that can automatically adapt SMS communication based on “what’s working” for each individual. In Phase I, we conducted a single group study among 19 participants with hypertension. Electronic pill bottle openings served as the outcome that the reinforcement learning agent sought to optimize. Five categories of messages were developed and up to two messages were sent daily. The distribution of messages delivered changed over time, indicating that the messages adapted based on participants’ experience. The proportion of participants reporting they took their medications as prescribed on 5+ days in the past week increased from 89.5% at baseline to 94.7% at six months. There were no statistically significant differences in the disease and medication beliefs from baseline to 6 months, although medication necessity beliefs increased and medication concern beliefs decreased. In Phase II, 48 participants, with a medication possession ratio <0.5 and taking at least one anti-hypertensive medication, were enrolled into a 6-month, randomized, controlled trial. Participants in the intervention group could receive one of five messages up to once daily. In interim analysis for n=43 with an average of 102 days of participation, participants had a baseline self-reported Morisky adherence score of 7.02 ± 1.55 in the treatment group and 6.78 ± 1.32 in the control group (p=0.58). We built a preference for no messages into the system, and the percentage of time that no message was sent increased from 43% in month one to 65% in month three and to 79% in month six. Intervention participants were more likely to be adherent at 6 months than controls (94% versus 80%; p=0.06). Results from two studies suggest that a reinforcement learning SMS system can adapt the content of SMS messages over time and may improve medication adherence.

Symposium 11B

FACILITATING SUCCESSFUL MHEALTH MEDICATION ADHERENCE: LISTENING TO THE PATIENTS

Frank A. Treiber, PhD

Poor medication adherence (MA) remains a critical problem in management of all chronic diseases and impacts ~50% of patients. Numerous technology-enabled devices/ systems have emerged to address the problem. They enable real time capture of use of pill bottles/trays, actual pill intake, provide various reminder tactics for med intake and often include efforts to increase health literacy. Clinical trial data are emerging which suggest some solutions remain cost prohibitive, do not link MA to biofunctioning relevant to the meds and/or use of reminder alerts (e.g., visual/audio signals , SMS messages, etc.) don't necessarily result in robust sustained improvements. Approaches may not have fully capitalized upon expertise of the intended users and lacked tactics to facilitate sustained motivation to adhere to the technology enhanced clinical regimens.

This presentation will provide an overview and update of ongoing refinements of a patient/provider centered, theory guided mHealth medical regimen self-management system. This iterative design process began with key informant interviews and focus groups with patients and healthcare providers for prototype development. Usability testing followed including expert and user based heuristic and cognitive walk through evaluations. Refinements were made and field based usability tests run. Subsequent large group survey/demo studies followed to gather patients' guidance for final refinement. Three feasibility trials were run with different patient groups, all with uncontrolled hypertension (HTN) (i.e., transplant recipients, FQHC HTN patients, post-stroke patients). Findings revealed high usability and satisfaction, 95-100% MA, large BP reductions, and 65-100% BP control compared to far lower outcomes in standard care groups. Our most recent examination of these trials and interim analyses from ongoing research have shown that patients who maintain MA scores >.90 during first 3 months and are taking < 5 meds desire to revert back to a standard plastic tray. They have successfully maintained BP control. Subjects with single morbidity of HTN are often more challenging to establish sustained adherence than those HTNs with multi-morbidities .Experiences during the trials/ post-trial interviews verified importance of identifying patients' motivational drivers (e.g., family, faith, friends, short /long term life goals).Linking patients' behavioral changes (e.g., increased MA) to these drivers facilitated regimen adherence . Recent analyses suggest MA is sustained following trial cessation. We will present how we have refined our system including expansion of tailored motivational /social reinforcement SMS message library and use of audio recordings, photo voice, etc. to further enhance relevance of the feedback messages aimed at fostering greater autonomous motivation for sustained adherence.

Symposium 11C

LET VISUALS TELL THE STORY: MEDICATION ADHERENCE IN PATIENTS WITH TYPE II DIABETES CAPTURED WITH AN INGESTION SENSOR PLATFORM

Dr. Sara Browne, MD, MPH

Background: A novel sensing platform, Digital Health Feedback System (DHFS), can detect ingestion events and physiological measures simultaneously, using an edible sensor, personal monitor patch, and paired mobile device. The DHFS generates dense data.

Objective: To use modern methods of visual analytics to represent continuous and discrete DHFS data, plotting data simultaneously to evaluate the potential of the DHFS to capture longitudinal patterns of medication-taking behavior and self-management.

Methods: Visualizations were generated using time domain methods of data obtained by the DHFS use in 5 Subjects with type II diabetes over 37-42 days. The DHFS captured at-home metformin adherence (via sensor co- ingestion) with heart rate, activity, and sleep/rest. A mobile glucose monitor captured glucose testing and level (mg/dl). Algorithms were developed to analyze data over: the entire study, daily, and weekly. Following visualization analysis, correlations between sleep/rest and medication ingestion were calculated.

Results: A total of 197 subject days, and 141,840 data events were analyzed. Individual continuous patch use varied between 87-98%. On average, the cohort took 78% (SD 12) of prescribed medication and took 77% (SD 26) within the prescribed ±2-hour time window. Average activity levels per subjects ranged from 4000-12,000 steps per day. The combination of activity level and heart rate indicated different levels of cardiovascular fitness between subjects. Visualizations over the entire study captured the longitudinal pattern of missed doses (the majority took place in the evening), the timing of ingestions in individual subjects, and the range of medication ingestion timing, which varied from 1.5-2.4 hours (Subject 3) to 11 hours (Subject 2). Individual morning self-management patterns over the study period were obtained. Visualizations combining multiple data streams over a 24-hour period captured patterns of broad daily events: when subjects rose in the morning, tested their blood glucose, took their medications, went to bed, hours of sleep/rest, and level of activity during the day. Visualizations identified highly consistent and highly erratic daily patterns in different Subjects. Correlation between sleep /rest and medication ingestion was evaluated. Subjects 2 and 4 showed correlation between amount of sleep/rest over a 24-hour period and medication-taking the following day (Subject 2: $r = 0.47$, $P< .02$; Subject 4: $r = 0.35$, $P< 0.05$). With Subject 2, sleep/rest disruptions during the night were highly correlated ($r = 0.47$, $P< 0.009$) with missing doses the following day.

Conclusions: Visualizations integrating medication ingestion (via sensor co-ingestion) and physiological data from the DHFS over varying time intervals captured detailed individual longitudinal patterns of medication adherence and self-management in the natural setting.

Symposium 12 8:00 AM-9:15 AM

EMERGING PERSPECTIVES ON TREATMENT AND SELF-MANAGEMENT CHALLENGES OF CHRONIC DISEASE IN EMERGING ADULTHOOD

Amanda S. Phillips, M.S.[1], Deborah Wiebe, MPH, PhD[2], Susmita Kashikar-Zuck, PhD[3], Elizabeth J. Siembida, Ph.D.[4], Cheryl LP. Vigen, PhD[5]

[1]University of North Texas, Denton, TX; [2]University of California, Merced, Merced, CA; [3]Cincinnati Children's Hospital Medical Center, Cincinnati, OH; [4]University of Connecticut, Bethesda, MD; [5]University of Southern California, Los Angeles, CA

Treatment and self-management considerations for emerging adults managing chronic disease are a growing priority. Emerging adults experience unique challenges concerning psychosocial adjustment and behavioral self-management of chronic disease. For example, millions of emerging adults in the United States make the decision to move away from their parents’ home each year. These emerging adults are often lost in the transition from pediatric to adult care. For some conditions, youth are now surviving into adulthood, creating challenges for adult care physicians who are not experienced with these pediatric conditions or with the normative developmental context of emerging adults. Greater understanding of the patient, illness, and health care provider factors that contribute to illness management is needed for this understudied emerging adult population. This symposium will examine the common and unique challenges emerging adults face in working with health care providers and self-managing three chronic conditions: fibromyalgia, diabetes, and cancer. The chair will provide a brief overview of the symposium and impact of chronic disease on emerging adults. The first panelist will present original longitudinal research outlining trajectories of pain and mood symptoms from adolescence to emerging adulthood among those with fibromyalgia. Early psychosocial factors affecting adjustment to chronic pain and key risk factors to be targeted in treatment will be examined. The second panelist will present original research concerning the association of depressive symptoms and diabetes distress with glycemic control in low-SES emerging adults with diabetes, and will discuss treatment implications. The third presenter will discuss the role of the doctor-patient relationships and cognitive development in cancer patients’ perceptions of quality of care, and the importance of using particular clinical skills when treating emerging adult cancer patients. Finally, an integrated overview of the challenges of chronic illness management in emerging adulthood will be provided by the discussant.

Symposium 12A

TRAJECTORIES OF PAIN AND MOOD SYMPTOMS IN A LONGITUDINAL COHORT OF YOUTH WITH FIBROMYALGIA AND PREDICTORS OF LATER ADJUSTMENT

Dr. Susmita Kashikar-Zuck, PhD

Juvenile fibromyalgia (JFM) is one of the most poorly understood chronic pain conditions. Until recently, very little attention was paid to the prognosis of JFM into adulthood, the long-term impact of JFM on functioning or early indicators of adjustment to this potentially debilitating pain disorder. In a prospective longitudinal study of adolescents with JFM (N = 116) and healthy controls (N = 43), we conducted a series of detailed assessments of physical and psychosocial functioning at from adolescence to adulthood (Mean age = 15 years at Time 1 and 23.4 years at Time 4). Of the JFM group, the majority (>85%) continued to experience pain or other JFM symptoms and nearly half (48%) met full criteria for fibromyalgia in adulthood. This presentation focuses on results of longitudinal growth models showing 3 distinct trajectories of pain and 2 trajectories of depressive symptoms from adolescence to adulthood in the JFM group, and the impact of these trajectories on physical functioning over time. The subgroup of JFM participants with unremitting pain and worsening depressive symptoms had the poorest outcomes. Prior research has shown that regular participation in physical activity and using active psychological coping strategies are essential to successful management of chronic pain. However, no studies have examined risk and resilience factors that impact the management of pain and disability in the crucial transition from adolescence to young adulthood. As part of the longitudinal study, we examined family functioning, trauma history, social support, mood and physical activity participation in youth with JFM. Several factors such as a controlling family environment, early exposure to traumatic events and lower perceived social support were significantly related to psychosocial adjustment in adulthood. Depressive symptoms and smaller social networks were associated with lower physical activity participation. The presenter will discuss how key findings from this longitudinal examination of JFM illuminate our understanding of specific risk factors that need to be targeted for optimal long-term management of pain and disability in fibromyalgia, especially as adolescents with JFM transition into adulthood.

Symposium 12B

ADOLESCENT AND EMERGING ADULT CANCER PATIENTS: THE IMPORTANCE OF DOCTOR-PATIENT RELATIONSHIPS AND COGNITIVE DEVELOPMENT IN QUALITY OF CARE

Elizabeth J. Siembida, Ph.D.

Emerging adults are unique from their older and younger counterparts because of their more sophisticated cognitive skills, such as improved decision making and information processing, but the necessity of supportive adults in their lives. Emerging adults diagnosed with cancer are not immune to this developmental trajectory, and the current study was undertaken to examine the experience of quality of care in a sample of adolescent and emerging adult cancer patients (diagnosed between the ages of 10 and 20). This cross-sectional survey examined participants' perception of engagement in care; the doctor-patient relationship; quality of care; their cognitive development, specifically their decision making and evaluative thinking skills; and readiness for transition into adulthood. Bivariate and multivariate analyses found little difference in perceptions of quality of care based on age or transitional readiness. Instead, increased cognitive development (β=.226, $t(94)$=2.468, p=.015) and experiencing the opportunity for bi-directional information provision with providers was associated with increased quality of care (β=.345, $t(94)$=3.324, p=.001). The lack of a significant relationship between chronological age and quality of care points to the importance of developmental milestones, rather than age, as an important factor in initiating the transition to adult healthcare. The role of increased cognitive development highlights the need for a certain level of decision making and evaluative skills that are only gained as an individual enters late adolescence and begins the developmental transition into emerging adulthood. The significant relationship with bi-directional information provision points to the important role doctors play in the cancer experience for adolescents and emerging adults. In looking for ways to improve the transition from adolescence to emerging adulthood within the oncology context, doctors appear to be ideally situated to help provide support and guidance to their patients as they begin to take on an increased role in their care.

Symposium 12C

DEPRESSIVE SYMPTOMS, DIABETES DISTRESS AND GLYCEMIC CONTROL IN LOW-SES EMERGING ADULTS WITH DIABETES

Cheryl LP. Vigen, PhD

Emerging adults (EAs) with diabetes experience high rates of elevated blood glucose (as indexed by hemoglobin A1c), depressive symptoms (DS), and diabetes distress (DD), all of which contribute to increased risk of diabetes complications, disability and mortality. We examined relationships between DS, DD, and A1c among a cohort of low-SES, largely minority EAs with diabetes, using baseline data from an occupational therapy diabetes management intervention randomized controlled trial.

Participants were 81 EAs (75% type 1 diabetes; mean age 22.6 years; mean A1c 10.8%). We assessed DS via the Patient Health Questionnaire (PHQ-8) and DD via the Problem Areas in Diabetes-Short Form (PAID-5). Spearman correlations and p-values are presented; differences in medians are evaluated with Wilcoxon rank sum tests.

Women had higher DS than men (median PHQ 6.0 vs 4.0, p=0.02); no other demographic variables were associated with DS scores. In univariate analysis, DD was not significantly associated with A1c (r=0.19, p=0.09). In contrast, DS was associated with increased A1c (r=0.27, p=0.02). This relationship remained after adjusting for potential confounders and for blood glucose monitoring and medication adherence, both strong behavioral predictors of A1c.

EAs with a depression diagnosis in their medical records (n=14) did not have higher DS than those who did not (median PHQ 6.0 vs 5.0, p=0.10); the association between A1c and DS remained significant when restricted to those without a diagnosis. Among EAs with PHQ scores below the cut-off for major depression (PHQ <10), there was no association between DS and A1c (r=0.06, p=0.67), but for those with scores ≥10, the association was substantial (r=0.47, p=0.03).

Overall, in a cohort of low-SES, largely minority EAs, DS was more closely associated with A1c than was DD; furthermore, the relationship between DS and A1c was not explained by blood glucose monitoring or medication adherence. The PHQ cut-off score for major depression may be a threshold above which DS affects A1c. Given the high proportion of EAs with both DS and elevated A1c, screening and providing psychosocial intervention for DS may be effective in improving both physical and mental well-being in this population.

Symposium 13 8:00 AM-9:15 AM

PROMOTING PHYSICAL ACTIVITY INTERVENTIONS AMONG PEOPLE WITH MENTAL DISORDERS: A CONTINUUM

Ahmed Jerome Romain, PhD[1], Felipe Barreto Schuch, PhD[2], Simon Rosenbaum, PhD[3], Joseph Firth, BSc[4], Philip B. Ward, BMedSc, PhD[5]

[1]University of Montreal Hospital Research Centre, Montreal, PQ, Canada; [2]Centro universitário la salle (unilasalle) – rio grande do sul, Canoas, Rio Grande do Sul, Brazil; [3]UNSW, Sydney, New South Wales, Australia; [4]University of Manchester, Manchester, England, United Kingdom; [5]UNSW Australia, Liverpool BC, New South Wales, Australia

Within the last years, there was a growing interest towards the benefits of physical activity among people with mental disorders. Even though recent studies highlighted the positive impact of physical activity, more work is needed to facilitate its initiation as to develop more efficacious interventions to sustain it over time.

As such, the present international symposium (Australia, Brazil, England, and Canada) aims to propose several presentations on the need for lifestyle interventions in people with mental disorders at various stages and further propose new interventions to improve their physical and mental health over the long term.

In a first presentation, we will show that the co-occurrence of obesity and mood disorders was associated with poor psychological well-being, more health comorbidities, higher use of health services and less adequate health behaviours. In a second presentation, we will present results from a trial assessing whether physical activity is feasible in first-episode psychosis individuals and if the health benefits could be maintained overtime. The other speaker will talk about a project with 3 phases, developed in coordination with the national insurer for workplace injury, on the implementation of physical activity in first-responders people developing posttraumatic stress disorder. Then, the next speaker will discuss the results from a 6-month RCT intervention, conducted among people with major depressive disorder, which aimed to promote physical activity using wearable technology and a theoretical model of motivation. Finally, given the necessity to have a reliable measure of physical activity, the last talk will be on the first results from the international and cross-cultural validation of the simple physical activity questionnaire in people experiencing mental illness.

All bring together, these presentations will cover several aspects of the lifestyle intervention prism going from the prevention, through methodological and interventions studies with follow-up. Moreover, the symposium, as the presenters will have the objective to highlight the necessity to develop more appropriate lifestyle interventions in people with mental disorders to improve their functioning and quality of life.

Symposium 13A

IMPACTS OF OBESITY AND MOOD DISORDERS ON PSYCHOLOGICAL WELL-BEING, COMORBIDITIES, HEALTH BEHAVIOURS AND USE OF SERVICES.

Dr. Ahmed Jerome Romain, PhD

Introduction: Obesity is highly prevalent in North-America people with mood disorders (e.g., bipolar disorder, major depressive disorders) are more likely to be affected. Even though obesity and mood disorders frequently co-occur, few studies examined if the presence of a mood disorder can be an aggravating factor of obesity-related conditions.

Objective: to analyze whether people with obesity and mood disorders (POMD) differ from those without mood disorder (Ob) in terms of psychological well-being, comorbidities, health behaviours and use of health services.

Methods: Cross-sectional study based on the Canadian Community Health Survey (CCHS) conducted in 2007-2008. Sample of people with obesity (n = 1298) was weighted to represent the inhabitants from the province of Quebec (Canada). The CCHS used diagnostic criteria outlined in the DSM-IV-TR to screen respondents.

Results: POMD (n = 99) were more likely to be women than Ob (n = 1199), (65%, 95%CI[56.29-75.05%] vs 45%, 95%CI[42.92-48.56%]). In terms of psychological well-being, POMD were more likely to report poor mental health (40%, 95%CI[31.81-51.32%] vs 3.17%, 95%CI[2.32-4.34%]) with more psychological distress (37.5%, 95%CI[28.96-48.55%] vs 4.25%, 95CI [3.23-5.59%]) and anxiety disorders (39.79%, 95%CI[31.19-50.76%] vs 4.01%, 95%CI[3.04-5.28%]).

Regarding comorbidities, higher percentages of POMD reported arthritis (32.65%, 95%CI[24.57-43.39%] vs 16.58%, 95%CI [14.60-18.83%], low back pain (41%, 95%CI[32.41-51.87%] vs 19.48%, 95%CI[17.36-21.86%]). No significant differences were found in migraine, hypertension and type 2 diabetes.

In terms of use of services, compared to Ob, POMD had more frequents consultations to doctors (86.87%, 95%CI[80.46-93.78%] vs 74.21%, 95%CI[71.77-76.73%]), nurses (27.27%, 95%CI[19.77-37.62%] vs 15.44%, 95%CI [13.52-17.63]) and psychologists (21.21%, 95%CI[14.51-31.0%] vs 3.08%, 95%CI[2.25-4.24]).

Regarding their health behaviours, higher percentages of POMD reported to be inactive (79.59%, 95%CI[71.99-87.98%] vs 66.67%, 95%CI[64.05-69.39%]), or to be limited in their physical activity (37.37%, 95%CI[28.96-48.23%] vs 13.90%, 95%CI[12.07-16.01%]). No differences were found on tobacco and fruits/vegetables consumption.

Discussion: The presence of a mood disorder seems to be an aggravating factor in obesity because it was associated with poor health in several areas. There is a need to more consider obesity as health behaviours among POMD.

Symposium 13B

PHYSICAL ACTIVITY PROMOTION IN PEOPLE WITH MAJOR DEPRESSIVE DISORDER USING WEARABLE DEVICES: A CLINICAL TRIAL

Felipe Barreto Schuch, PhD

People with major depressive disorder (MDD) have decreased levels of physical activity(PA) when compared to the population levels. Also, there is evidence that this relationship is bidirectional, and that increasing PA reflects in the alleviation of depressive symptoms in people with depression. Motivational and other cognitive strategies have been used to help people with MDD to achieve the recommended PA levels, however, the results suggest the need for additional strategies. The present study aims to increase PA levels of outpatients with MDD (n=120). It is a randomized clinical trial with 6 months of intervention, single blinded for the main outcome (depressive symptoms assessed by the clinician). Participants are being randomized into two groups: an intervention group, that wore a wearable pedometer, with daily goals of steps to achieve and received a contact using self-determination theory elements. The aims of daily steps to be achieved increase every month until reach the public health recommendations of 10.000 steps per day; and a control group that received general recommendations of PA promotion. Both groups were under usual treatments for depression (pharmacotherapy). Patients were contacted once per week by telephone or face-to-face contacts. Analysis on the effects of the intervention on PA levels, depressive symptoms (both self and clinician assessed), and quality of life will be evaluated. Also, the study plans to evaluate potential factors that predict success/failure.

Symposium 13C

IMPLEMENTING PHYSICAL ACTIVITY IN PTSD: APPLYING EVIDENCE-BASED PROGRAMS FOR WORKPLACE-RELATED PSYCHOLOGICAL INJURIES

Dr. Simon Rosenbaum, PhD

Emergency service workers and first-responders (police, fire, ambulance officers) are at significantly higher risk of poor mental health, including developing posttraumatic stress disorder (PTSD) and/or increased risk of suicide, in response to occupational exposure to potentially traumatising experiences. PTSD is also associated with high rates of preventable cardiometabolic disease including obesity and metabolic syndrome, with symptoms of hyperarousal associated with lower physical activity participation. Despite increased community and organisational recognition of the risks associated with poor mental health among veteran populations, translation of targeted programs to address the specific physical and mental health needs of first responders is in its infancy. This study aims to build on findings from an RCT of exercise augmentation for inpatients with PTSD in which exercise reduced both PTSD and depressive symptoms at a clinically significant level and improved body composition, compared to treatment as usual. The goal of the present study was to translate this exercise program for community-based first responders identifying as suffering from psychologically injury. To facilitate translation of the intervention, a multi-phase evaluation process was conducted. Phase 1 involved conducting focus groups with current emergency service crews (n>50 participants; fire and rescue) to document their views regarding mental health help-seeking behaviour, physical activity and opportunities for promoting access to exercise interventions. Themes identified included the acceptability of exercise as a coping strategy for first responders, and highlighted the need for interventions aimed at reducing stigma towards mental health issues among first-responders. Phase 2 involved longitudinal monitoring of the physical and mental health of first responders using a mobile phone application (n=17). A significant proportion of respondents (41%: 7/17) failed to achieve basic physical activity guidelines (150 minutes of moderate to vigorous physical activity per week). Results are being used to inform Phase 3, in which we will design and implement an exercise program for first responders with psychological injury, in partnership with the national insurer for workplace injury.

Symposium 13D

INVESTIGATING THE FEASIBILITY AND BENEFITS OF EXERCISE IN EARLY PSYCHOSIS

Mr. Joseph Firth, BSc

Exercise has previously been shown to reduce symptoms of schizophrenia in long-term patients, along with improving their physical health and cognitive functioning. However, the effects of exercise in the early stages of psychosis have not been widely investigated. This study aimed to examine the feasibility of using individualized exercise training to improve physical and mental health outcomes in people with first-episode psychosis (FEP), and to explore if the benefits of exercise can be sustained overtime. Twenty-eight people with FEP participated in 10-weeks of twice-weekly supervised exercise, using activities tailored to their own choice. Participants were assessed at baseline, 10-weeks, and then six-months after the supervised intervention, and compared to a group of patients with FEP who did not receive exercise training. During the 10 weeks of supervised exercise, participants achieved 107 minutes of moderate-to-vigorous exercise per week. Post-intervention assessments found significant improvements in psychiatric symptoms, verbal memory and social functioning. After 6 months, 55% of participants had continued their exercise. Only those who had maintained regular exercise after 6 months continued to show reductions in psychiatric symptoms, whereas the symptoms of those who had ceased exercising had returned to baseline scores. Previously-observed benefits of exercise for social functioning were also maintained at the follow-up, although cognitive improvements were lost. Future research should establish the effectiveness of exercise for early psychosis in randomized controlled trials, along with exploring optimal methods for implementing exercise interventions into clinical care, in order to improve symptomatic and functional recovery from the earliest stages of illness.

Symposium 13E

EVALUATING PHYSICAL ACTIVITY INTERVENTIONS : DEVELOPMENT & VALIDATION OF THE SIMPLE PHYSICAL ACTIVITY QUESTIONNAIRE (SIMPAQ)

Prof. Philip B. Ward, BMedSc, PhD

Physical activity is consistently associated with improved physical and mental health among people experiencing mental illness. Given increasing interest physical activity as a component of treatment, ensuring that valid, clinically useful and feasible measures of physical activity are available for routine use is of paramount importance. Existing self-report measures fail to address unique considerations and limitations faced by people experiencing mental illness. The SIMPAQ is a 5–item clinical tool taking between five and 10 minutes to complete, designed to assess physical activity among populations at high risk of sedentary behaviour, such as those experiencing mental illness. This study aimed to determine the reliability and validity of the SIMPAQ among mental health service users against an objective measure of physical activity (accelerometer). We hypothesise that the SIMPAQ will demonstrate acceptable reliability and criterion validity (i.e. correlation > 0.3 or above for total physical activity) against the objective measure.The SIMPAQ is currently being validated across >25 sites in >18 countries. Eligible participants are adults aged 18-65 years, currently treated at participating treatment facilities, who meet DSM or ICD criteria for any mental disorder (excluding eating disorders). Demographic and anthropometric information, psychiatric diagnoses, somatic co-morbidities, medication usage, symptom severity (DSM-5 Cross-Cutting tool) and cognitive capacity (Montreal Cognitive Assessment) are assessed. Participants complete the SIMPAQ through a structured interview. Participants are given a tri-axial accelerometer to wear during waking hours for seven days. This study aims to recruit approximately 1000 participants across a variety of psychiatric treatment facilities.As of September 2016, validation data has been collected from n=95 subjects in six countries (Australia, Brazil, Spain, USA, India, Switzerland).Preliminary analysis demonstrates that the SIMPAQ is clinically feasible and acceptable across a range of languages and clinical settings.

Symposium 14 8:00 AM-9:15 AM

METHODOLOGICAL CHALLENGES IN STUDIES WITH STIGMATIZED POPULATIONS OF WOMEN

Karen F. Stein, PhD[1], Lisette Jacobson, PhD, MPA, MA[2], Leigh Ann Simmons, Ph.D., M.F.T.[3], Laura L. Hayman, PhD, RN, FAAN, FAHA[4]

[1]University of Rochester, School of Nursing, Rochester, NY; [2]University of Kansas School of Medicine-Wichita, Wichita, KS; [3]Duke University School of Nursing, Durham, NC; [4]University of Massachusetts Boston, Boston, MA

Stigma is broadly recognized as a fundamental cause of inequities in health and health care. While both men and women experience stigma, data show that women are frequently the gatekeepers of their families' health. Thus, women in groups that are stigmatized due to racial/ethnic identity, immigrant status, geographic residence, and overweight and obesity experience additional educational, economic, and social barriers that negatively affect not only their own health outcomes but also those of their children and families. Moreover, women in these stigmatized groups experience disproportionate rates of physical and mental health disorders, yet remain among those least likely to seek health care services. However, studies designed to address the health care needs of these underserved populations of women encounter unique challenges in all aspects of the research process. These challenges are far reaching and include accessing the population, recruitment, retention, valid and reliable measurement tools, and culturally sensitive intervention design and implementation. The purpose of this symposium is to describe methodological challenges associated with conducting research with stigmatized populations of women and to provide practical solutions to overcome these common barriers to research. Karen Stein will discuss two projects focused on body weight perceptions, eating and weight control behaviors in undocumented, low acculturated women of Mexican origin living in rural farming communities in Western New York. Lisette Jacobson will discuss the process of completing two pilot studies to understand the needs of an obstetrical population located in an extremely remote rural region of a Midwestern state prior to designing a health promotion intervention. Leigh Ann Simmons will discuss two interventions with women who experience weight stigma associated with entering pregnancy overweight or obese or gaining excess weight during pregnancy. Discussant Laura Hayman will provide a critical analysis and synthesis of presentations with emphasis on directions for future research with stigmatized populations.

Learning objective 1: Identify and describe methodological challenges encountered in health research focused on stigmatized population of women.

Learning objective 2: Describe strategies to improve recruitment, retention, construct measurement, and other design challenges encountered in health research with stigmatized populations of women.

Learning objective 3: Describe initial steps toward designing culturally sensitive interventions that consider the intersection of stigma with other factors that affect health outcomes.

Symposium 14A

LIVING IN THE SHADOW: UNDOCUMENTED MEXICAN AMERICAN WOMEN AND RESEARCH CHALLENGES.

Karen F. Stein, PhD

Objective: Undocumented Mexican women living in the U.S. are a stigmatized group who experience significant health disparities and limited access to health care. Particularly in border states, the threat of deportation and separation from children and family result in high levels of fear and isolation. Consequently, despite their numerous health disparities and significant unmet health care needs, undocumented Mexican American (MA) women remain an understudied population. The primary purpose this paper is to describe the challenges associated with conducting research with this population and present practical solutions developed in two studies focused on body weight perceptions, eating and weight control behaviors in samples of undocumented young adult Mexican American women.

Design and Methods: Two studies using qualitative (focus groups) and quantitative (ecological momentary assessment) were completed with two samples of non-pregnant Spanish speaking MA women ages 18-45 years (total N=75) with undocumented legal status, low acculturation, low health literacy and living in rural farming communities in Western New York. Methodological challenges common across studies included: (1) accessing the target population, (2) addressing exceptional needs for anonymity, (3) engaging family gatekeepers, (4) identifying meaningful participant incentives, (5) avoiding socially desirable responses shaped by stigma and embarrassment. Practical solutions were developed through collaboration with community member advocates, institutional review board representatives, study participants and trial and error.

Conclusion: Research with undocumented populations of MA women requires attention to their unique stigmatized social position and cultural nuances to ensure validity and reliability of study results. Adjustments to study protocols that meaningfully address these challenges are feasible and essential to successful completion of much needed research with this understudied population of women.

Symposium 14B

PROPOSING AN INTERVENTION TARGETING UNDERSERVED RURAL PREGNANT WOMEN: LESSONS LEARNED FROM TWO PILOT STUDIES

Dr. Lisette Jacobson, PhD, MPA, MA

Background: In the United States, pregnant women who live in rural locations are more likely to experience adverse birth outcomes compared to women in urban locations. This is partially due to limited access, availability, and delivery of obstetrical healthcare services in rural regions. Serving an underserved population in a Midwestern state, a rural hospital with 300 deliveries per year experienced a high rate of complicated pregnancies and births. The purpose of this presentation is to describe the methodological challenges associated with studies involving the pregnant population in this rural area.

Methods: Two pilot studies, quantitative (i.e., obstetrical health assessment) followed by qualitative (i.e., focus groups), were completed. Results from the health assessment (N=177) indicated that the majority of pregnant women were Hispanic and of low socio-economic status, were overweight/obese, did not engage in exercise, and had a family history of diabetes. Further, focus group findings (N=17) showed that women reported having limited access to health promotion programs and breastfeeding support.

Results: Common themes across both studies included: (1) buy-in from local stakeholders; (2) importance of relationship building among local healthcare providers and researchers; (3) ease of work flow and continuous follow-up with on-site clinic personnel; (4) being mindful of the “no-show factor”; and (5) identifying meaningful incentives. Study findings were used in application for a K-award with the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) testing the feasibility of a health promotion intervention that contains physical activity, dietary habits, and breastfeeding support.

Conclusion: Proposing an intervention approach that targets underserved rural pregnant women requires prior in-depth study of this population. Moreover, inclusion of these women, local key stakeholders, and healthcare providers in discussions surrounding behavioral change could be beneficial with recruitment, participation, and retention in future interventions.

Symposium 14C

BEHAVIORAL WEIGHT MANAGEMENT TRIALS DURING PREGNANCY AND POSTPARTUM AMONG OVERWEIGHT AND OBESE WOMEN: THE ROLE OF WEIGHT BIAS

Dr. Leigh Ann Simmons, Ph.D., M.F.T.

Objective: Weight bias contributes to negative healthcare experiences among pregnant and postpartum women with overweight and obese BMIs. Studies of patients in maternity care settings show they experience discomfort, guilt, and shame for their weight status, as well as indifference, judgment, and disrespectful treatment from providers. Underscoring these findings, research also shows that many obstetric providers hold negative attitudes toward pregnant women with $BMI \geq 25$, including less positive attitudes toward caring for these patients and negative judgments about their self-management behaviors. Given the pervasiveness of obesity stigma in obstetric care, designing interventions aimed at limiting pregnancy weight gain or promoting postpartum weight loss for women with prepregnancy $BMI \geq 25$ requires consideration of how weight bias may influence their research participation.

Data and Methods: Design considerations and lessons learned regarding intervention approaches and content were characterized for two studies: (1) a digital intervention to promote healthy prenatal diet for women who entered pregnancy with a $BMI \geq 25$; and (2) a telephonic coaching intervention for women who gained gestational weight in excess of Institute of Medicine recommendations for prepregnancy BMI.

Results: Interventions that address pregnancy weight gain and postpartum weight loss among women with $BMI \geq 25$ who may experience weight bias should consider the following strategies to promote recruitment, adherence, and retention: (a) focus change behaviors on meeting healthy dietary goals rather than numbers-based targets, such as weekly pounds gained prenatally or lost postpartum; (b) use computer-mediated communication, mobile technologies, or telephonic coaching instead of in-person behavioral support strategies to protect participants' visual anonymity; and (c) develop interventions that address the whole person and recognize the transition to parenthood as a unique, challenging time versus interventions that focus solely on weight-related behaviors like diet and exercise.

Conclusions: Among women with overweight and obese BMIs, weight bias and obesity stigma likely affect research participation in behavioral weight management trials. Study designs that consider participants holistically, reflect the unique nature of pregnancy and the postpartum period, and offer women options for remaining visually anonymous to interventionists may facilitate recruitment, adherence, and retention with this vulnerable group of participants.

Symposium 15 8:00 AM-9:15 AM

PAIN MANAGEMENT: TRANSLATING POLICY AND GUIDELINES INTO PRACTICE

Martin Cheatle, PhD[1], Robert Twillman, PhD, PhD[2], Lara Dhingra, PhD[3], Rollin Mac. Gallagher, MD, MPH[4]

[1]Perelman School of Medicine at the University of Pennsylvania, Philadelphia, PA; [2]Academy of Integrative Pain Management, Lenexa, KS; [3]MJHS Institute for Innovation in Palliative Care, New York, NY; [4]University of Pennsylvania, Gladwyne, PA

Pain Management: Translating Policy and Guidelines into Practice

Approximately one-third of the adult American population experience chronic or recurrent pain and this number increases each year. The annual combined cost of pain care (healthcare costs, lost productivity and disability) has been estimated as reaching $600 billion which is far greater than what is expended on other major diseases including heart, diabetes and cancer. Effective pain management requires a balanced and multimodal approach which includes, in some cases, the use of opioid analgesics. There has been a growing controversy, however, over both the efficacy and safety of opioid analgesics in managing patients with chronic pain. This debate has stimulated a great deal of scholarly activity on both developing strategies and guidelines to identify and mitigate the risk of prescription opioid misuse, abuse and opioid-related fatalities but also a broader discussion on National pain policies and developing more effective pain care models. This multidisciplinary panel will discuss the current pain management policy activity and proposed National pain strategies; a review and critique of the recently published CDC guidelines of opioid prescribing in chronic pain and an integrated pain care model developed in the VHA.

Symposium 15A

CDC GUIDELINE FOR PRESCRIBING OPIOIDS FOR CHRONIC PAIN: TRANSLATING GUIDELINES INTO CLINICAL PRACTICE

Dr. Martin Cheatle, PhD

Over the past decade there has been a significant increase in the prescribing of opioids for chronic noncancer pain which has been paralleled by an increase in opioid related deaths and admissions to treatment facilities for opioid abuse. There has been considerable scholarly activity dedicated to developing risk assessment and mitigation strategies to curb the burgeoning opioid epidemic while preserving patients right to pain relief including the use of guidelines. This presentation will discuss the evolution of the opioid prescribing guidelines, review the latest CDC guideline and examine the challenges in translating the guideline into real-world clinical practice.

Symposium 15B

NATIONAL PAIN POLICY INITIATIVES

Dr. Robert Twillman, PhD, PhD

This presentation will present an overview of current policymaking activity related to pain management. While there has been a great deal of activity in this arena for several years, an increased focus on prescription drug abuse, addiction, and overdose on the part of the media and citizens in general, coupled with the issuance of the CDC's guideline for the use of opioids to treat chronic pain in primary care and the National Pain Strategy, has caused a new surge in policymaking. The challenges of crafting policies that permit the appropriate practice of pain management while simultaneously addressing problems related to prescription opioids will be highlighted, and solutions that could address both problems simultaneously and successfully will be proposed.

Symposium 15C

INTEGRATED STEPPED PAIN CARE: A POPULATION-BASED MODEL ADDRESSING THE PUBLIC HEALTH PROBLEMS OF CHRONIC PAIN & OPIOID OVER-USE

Dr. Rollin Mac. Gallagher, MD, MPH

Over 50 % of Veterans suffer chronic pain often complicated by PTSD and traumatic brain injury related to combat exposure and multiple deployments. As policy the VHA adopted a patient-centered, integrated, team-based, biopsychosocial Stepped Care Model based on the foundation of an informed Veteran learning self-management skills with integrated primary care teams supported by behavioral and integrative health and interdisciplinary pain specialty programs. This presentation describes implementation challenges, such as training deficits in pain management and safe opioid prescribing and the programs designed to address these deficits, such as behavioral and integrative health in primary care, the Pain Mini-Residency, and academic detailing in the Opioid Safety Initiative and SCAN-ECHO.

Symposium 16 8:00 AM-9:15 AM

THINK OF “ME”: SUBSTANCE USE IDENTITIES IN SUBSTANCE USE

Andrew Hertel, PhD[1], Kristen P. Lindgren, Ph.D., ABPP[2], Alexander W. Sokolovsky, MA[3], Andrew Hertel, PhD[1], Robin Mermelstein, PhD[4]

[1]Knox College, Galesburg, IL; [2]University of Washington, Seattle, WA; [3]Brown University, Chicago, IL; [4]University of Illinois at Chicago, Chicago, IL

Basic identity research demonstrates that our identities influence our behaviors and vice versa. Extensions of this research into the domain of substance use provide a more comprehensive view of substance use, as identity encompasses a set of correlates that are distinct from other known cognitive, affective, motivational, and neurobiological correlates. In particular, an emerging body of research demonstrates that substance use identities, which reflect that a behavior is no longer exclusively perceived as simply something one does but also as something that defines who one is (e.g., “I smoke” vs. “I am a smoker), can emerge from and contribute to substance use, from uptake through cessation. In this symposium, we present research on substance use identities, both explicit and implicit, from cross-sectional and longitudinal observational investigations in three different behavioral domains (alcohol consumption, electronic nicotine delivery system (ENDS) use, and cigarette smoking). The first presenter will show a within-subject reciprocal relationship between alcohol consumption and implicit drinking identity, using data from a longitudinal, repeated measures study among college students. Using data from studies aimed at development of an ENDS use continuation motives measure for young adult ENDS users, the second presenter will show a unique ENDS user identity factor and its relationships with ENDS continuation. The third presenter will show that implicit and explicit drinker and smoker identities are associated with craving for alcohol and cigarettes as well as attentional bias towards alcohol and cigarette cues, using data from observational studies among college student moderate drinkers and smokers as well as adult heavy smokers. Combined, the presentations inform understanding of the relationships between substance use identities and behaviors and indicate the value of including identity in explanations of substance use. The discussant will integrate the findings, discuss how they contribute to our understanding of substance use and inform intervention efforts, and suggest future avenues of inquiry.

Symposium 16A

WITHIN-PERSON CHANGE IN IMPLICIT DRINKING IDENTITY: CHANGES IN DRINKING IDENTITY PREDICT CHANGES IN DRINKING AND VICE-VERSA

Dr. Kristen P. Lindgren, Ph.D., ABPP

There has been a surge of interest in evaluating the role of implicit (fast/reflexive/impulsive) cognitions in substance use. In the domain of alcohol use, attention has been increasingly devoted to evaluating implicit cognitions about alcohol's association with the self (i.e., implicit drinking identity or associations with drinking and me vs. not me, Lindgren et al., 2013a). There is evidence that implicit drinking identity is a robust predictor of drinking cross-sectionally (Lindgren et al., 2013a, 2013b), across a wide age range (Lindgren et al., 2016a), and over time (Lindgren et al., 2016b). A critical next step toward establishing whether implicit drinking identity may represent a mechanism of behavior change and/or intervention target is to evaluate whether changes in implicit drinking identity are associated with changes in drinking behavior and vice-versa. Thus, the goal of the current study was to investigate whether changes in implicit drinking identity were associated with subsequent changes in drinking. Participants included 506 undergraduates (57% women), who completed assessments of their drinking behaviors and implicit drinking identity at 3-month intervals for a total of 8 assessments. Due to extreme non-normality in drinking behavior (50% of participants reported no drinking at Time 1), participants' drinking behaviors were converted to categories based on NIAAA's criteria: non-drinkers, low risk drinkers (men: no more than 14 drinks/week; women: no more than 7 drinks/week), and high risk (men: > 14 drinks/week; women: >7 drinks/week). Models, thus, evaluated whether within-person changes in implicit drinking identity were associated with changes in (i.e., increasingly risky) drinker categories and vice-versa. Cross lagged panel models indicated that changes in implicit drinking identity were positively associated with changes in drinker categories ($p < .001$). Further, changes in drinker category were also positively associated with changes in implicit drinking identity ($p < .001$). Results will be discussed in terms of implications for theory and intervention.

Symposium 16B

MOTIVES FOR CONTINUATION AMONG YOUNG ADULT USERS OF ELECTRONIC NICOTINE DELIVERY SYSTEMS: THE ROLE OF IDENTITY

Mr. Alexander W. Sokolovsky, MA

Substance users, including users of electronic nicotine delivery systems (ENDS) can develop identities associated with their use behavior that then contribute to maintenance and escalation of use. Substance use identities thus represent one of many possible social, emotional, environmental, and behavioral motives that are associated with continued substance use. Multifactorial measures developed to index cigarette smoking continuation motives often query behaviors unique to cigarette smoking that may not represent experiences of ENDS users. We used a mixed-methods approach to develop a novel measure of motives for ENDS use continuation among young adults (18-24). In a **qualitative** study, young adults ($N = 15$; 8 male; 8 non-Hispanic white; 2 African American; 2 Hispanic; 3 Asian) who reported past-week ENDS use and self-identified as regular ENDS users were invited to complete intensive longitudinal interviews in a private clinical setting. Emergent themes related to motives for continuation included ENDS user identity, as well as snacking, sensory experience, affiliative attachment, tolerance, craving, positive reinforcement (mood and social), negative reinforcement (mood and withdrawal), cognitive enhancement, task/skill mastery (i.e. hobbyism, modding, or device construction), automaticity, and cue reactivity (social and environmental). These themes informed the development of an item pool that composes this study's focal measure. In a **psychometric** study, a separate sample of young adults ($N = 304$; 61.5% male; 62.7% white; 21.7% Asian; 5.9% black; 81.6% non-Hispanic or Latino) self-identifying as regular ENDS users completed a survey on the Amazon MTurk platform. We probed for distinct factors and investigated validity and reliability of these factors. A unique ENDS user identity factor emerged. When controlling for DSM tobacco use disorder symptoms, ENDS user identity was associated with past-month days used ($\beta = .71$, SE = .15, $p < .05$), lifetime-use (OR = 1.08, 95% CI = 1.02-1.14, $p < .05$), and escalation (i.e. controlling for prior-year report of outcome) in nicotine concentration ($\beta = .19$, SE = .08, $p < .05$). These results suggest that ENDS user identity is a salient and unique correlate of ENDS use, independent of past use and dependence.

Symposium 16C

SUBSTANCE USE IDENTITIES, CRAVINGS, AND ATTENTIONAL BIAS IN CIGARETTE SMOKING AND ALCOHOL CONSUMPTION

Dr. Andrew Hertel, PhD

Substance use identities (e.g., smoker identity) are associated with regular substance use, but the reasons why are not well known. Understanding the correlates of substance use identities could inform substance use intervention efforts. Substance use craving and attentional bias (AB) toward substance use cues are proximal motivational and cognitive antecedents of regular substance use. In two studies, we examined whether substance use identities were associated with substance use cravings and AB toward substance use cues. In **Study 1**, college students who consumed alcohol in the past 30 days, a subset of whom also smoked a cigarette in the past 30 days ($n = 65$, age $M = 20.1$, 60.0% female, 70.6% White; $n = 32$ smokers), completed measures of explicit and implicit drinking- and smoking-related identities, alcohol and cigarette craving, as well as alcohol cue and smoking cue AB (Stroop tests). Alcohol craving was correlated with implicit drinker identity [$r(63) = .29$, $p = .021$] and explicit future non-drinker identity [$r(63) = -.31$, $p = .012$], but not when controlling for drinking frequency. Both cigarette craving and smoking cue AB were correlated with explicit smoker identity [*r*(30) = .67, *p* < .0001; *r*(29) = .42, *p* = .022] and explicit current non-smoker identity [*r*(30) = -.40, *p* = .024 ; *r*(29) = -.42, *p* = .020]; when controlling for smoking frequency, only cigarette craving was correlated with only explicit smoker identity [*r*(30) = .45, *p* = .011]. In **Study 2**, adult regular smokers with no intention of quitting in the next 30 days (*n* = 46, age *M* = 39.2, 51.1% female, 80% White) completed measures of explicit and implicit smoking-related identities, cigarette craving, and smoking cue AB (Stroop and visual dot probe tests). Regardless of nicotine dependence level, cigarette craving was associated with explicit smoker identity [*r*(42) = .43, *p* = .005] and implicit smoker identity [*r*(43) = .32, *p* = .038]; AB – Stroop was associated with implicit smoker identity [*r*(43) = .31, *p* = .044]; and AB – visual dot probe was correlated with explicit smoker identity [*r*(41) = .43, *p* = .006]. The findings indicate a need for future investigations of the dynamic relationships between substance use identities, craving, and attentional bias with respect to substance use as well as consideration of substance use identities in substance use interventions.

Symposium 17 8:00 AM-9:15 AM

CARING FOR TRAUMA SURVIVORS: CAREGIVER CHARACTERISTICS, COMPASSION FATIGUE, AND OUTCOMES OF A SPIRITUAL INTERVENTION

Andrea D. Clements, PhD[1], Jill E. Bormann, PhD, RN, FAAN[2], Rose Constantino, PhD, JD, RN, FAAN, FACFE, Fulbright Scholar[3]

[1]East Tennessee State University, Johnson City, TN; [2]VA San Diego Healthcare System Center of Excellence for Stress and Mental Health (CESAMH), San Diego, CA; [3]University of Pittsburgh School of Nursing, Pittsburgh, PA

This symposium will present three papers addressing different aspects of religiousness/spirituality applied to the realm of caregiving for trauma survivors. Religiousness/spirituality will be explored as a characteristic of caregivers, as a buffer of compassion fatigue for caregivers, and as an intervention in trauma survivors. The first paper addresses characteristics of caregivers by occupation with particular emphasis placed on the caregiver's own traumatic history through self-reported Adverse Childhood Experiences (ACE) scores, self-reported level of compassion, and self-reported intrinsic religiosity. The second paper offers a discussion of compassion fatigue in caregivers, pointing out the importance of self-care and care for colleagues who experience compassion fatigue, endorsing the importance of spiritual care among caregivers. The final paper will present findings from a prospective randomized trial that tested the effects of a spiritual intervention with veterans diagnosed with post-traumatic stress disorder (PTSD). It is hoped that a more general discussion will follow regarding religious/spiritual contributions to the care of trauma survivors.

Symposium 17A

ACES, INTRINSIC RELIGIOSITY, AND COMPASSION IN “HELPING PROFESSIONALS” TARGETED FOR TRAUMA-INFORMED CARE TRAINING

Dr. Andrea D. Clements, PhD

Background: Trauma-Informed Care (TIC), an empathy-centered paradigm focused on ameliorating the impact of experienced trauma, is being disseminated to helping professionals, but some occupational fields have been more receptive than others, inspiring investigation of receptivity predictors. Total *Adverse Childhood Experiences* (*ACE*) score, i*ntrinsic religiosity* (IR), and *compassion* were compared across helping occupations, conjecturing that individuals in resistant occupations may differ.

Objective: To investigate differences in *ACE* score, *IR*, and *compassion* across "helping professionals" targeted to receive TIC training.

Methods: Surveys of TIC implementation and respondent characteristics were administered 6 months apart. Email invitations were sent to community crime reduction coalition members (judicial, corrections, police, mental health, faith-based, medical, and other social service organizations). Recipients were asked to complete the survey and forward the email to invite others in these categories to complete the survey. Self-report items included occupation, the ACE Test, *IR, compassion*, and demographics.

Results: At time 1, 30 surveys were completed and at time 2, 43 were completed by currently employed human service workers and volunteers. *ACE* scores differed significantly ($F(5,85) = 2.50$, $p = .036$). *Judicial/Corrections/Police* had the fewest *ACEs*, but only significantly differed from the *Other* group. *Compassion* differed across occupations with *Volunteers*, *Educators*, and *Counselors* reporting higher levels than *Judicial/Corrections/Police* ($X^2(10, n=73) = 18.88$, $p = .04$). *IR* differed by occupation, with *Judicial/Corrections/Police*, *Volunteers*, and *Clergy* reporting high levels of *IR* and *Counselors*, *Judicial/Corrections/Police*, and *University Faculty* reporting the lowest levels of *IR* ($X^2(20, n=72) = 45.82$, $p = .001$).

Discussion: *Judicial/Corrections/Police* and *Educators* have been more resistant to TIC training than other groups such as *Counselors* and *Social Workers*. *Judicial/Corrections/Police* employees tended to be lower in *ACEs*, *IR*,and *compassion* than those in other fields. This could begin to explain the lack of TIC receptivity in probation/parole employees. Teachers were high in *compassion*, so it seems that *compassion* alone may not predict receptivity to TIC.

Symposium 17B

EFFECTS OF MANTRAM REPETITION ON SPIRITUAL WELLBEING AND MINDFULNESS IN VETERANS WITH PTSD: A RANDOMIZED TRIAL

Dr. Jill E. Bormann, PhD, RN, FAAN

Objective: Few spiritually-based interventions have been tested for effects on spiritual wellbeing and mindfulness in Veterans with posttraumatic stress disorder (PTSD). We compared 8-weekly, one-hour individually delivered sessions of the Mantram Repetition Program (MRP) with Present Centered Therapy (PCT) on subscales of spiritual wellbeing and mindfulness.

Method: A prospective, randomized trial was conducted in 169 veterans with PTSD randomly assigned to either MRP (*n*=87) or PCT (*n*=82). The Functional Assessment of Chronic Illness Therapy-Spiritual Wellbeing (FACIT-Sp-12) and Five Facet Mindfulness Questionnaire (FFMQ) subscales were assessed at baseline and post-treatment. Repeated measures analysis of variance (ANOVAs) were used for analysis.

Results: Participants were 85% male, 65% white, 34% married/partnered with average age of 49 years (*SD*=14.46). There were group by time interaction effects showing that MRP participants had significantly greater improvements in the subscales of FACIT-Peace, *F*(1,132)=4.24, *p*F(1,132)=3.96, *p*F(1,133)=11.15, *p*=.001.

Conclusion: The MRP significantly improved levels of spiritual peace and mindful non-reacting compared to PCT in Veterans with PTSD, suggesting possible for mechanisms of action. Both MRP and PCT resulted in improvements over time on spiritual meaning.

Symposium 17C

TITLE: EXPLORING THE CONSEQUENCES OF COMPASSION FATIGUE IN HEALTHCARE PROVIDERS AND HEALING IN SPIRITUALITY

Dr. Rose Constantino, PhD, JD, RN, FAAN, FACFE, Fulbright Scholar

Purpose: The purpose of this presentation is to inform the attendees of the signs, symptoms, and consequences of Compassion Fatigue (CF), the various ways it is displayed and the healing effects of spirituality. The signs and symptoms of CF are not readily seen by the untrained eye especially by the sufferer; it is an insidious and gradual lessening of compassion over time to the observant, trauma-informed, and compassionate co-worker, supervisor or partner.

Literature Review: We present applicable evidence based literature, examine protective factors and spirituality in both the healthcare provider and the CF sufferer. For example, Berg and others (2016) studied CF in a trauma team and found that team members were not managing work stresses as well as they perceived themselves to be**.** Wong (2004) presented a vision of positive holistic care through compassionate and spiritual care.He urgedhealthcare providers to consider the benefits of a "bio-psychosocial-spiritual model" which is effective, accessible and efficient.

Case Study: An extreme case of tension and preoccupation with the suffering of those being helped to the degree that it traumatizes the helper describes CF. It has been suggested that we enter into the healthcare giving field already with CF. CF differs from burnout as burnout is exhaustion from the chronic tedium of the job (Tabor 2011). The clinician in the case study will perform her duties and provide compassionate care to the patient devoid of CF. We will leave it to the audience to imagine what if the healthcare provider in this case was suffering from CF.

Implications: Whether we like it or not, believe or not, realize it or not, healthcare providers are in the ministry of compassionate and spiritual care because we "help" and "care"; dedicated to serving the sick and relief of human suffering. Without compassionate and spiritual care we become heartless and soulless. Spiritual care prods us to suffer with the others, to enter the dark places where it hurts. To healthcare providers in CF, they are unable to extricate themselves from those places and people who hurt; they stay there. Let's help them through compassionate and spiritual care.

Conclusions: No one is immune to job-related trauma and stress. We need to care for each other. We are indeed our brothers'/sisters' keeper. Being a compassionate and spiritual healthcare professional is not expensive nor does it remove anything from us in fact it adds something to the vast knowledge, information and evidence-based practice we already possess. Watch out for CF in ourselves, in our family, co-workers and healthcare providers.

Symposium 18 8:00 AM-9:15 AM

PROVIDING BRIEF EVIDENCE-BASED INTERVENTIONS IN HOSPITAL AND MEDICAL SETTINGS

Katherine Eisen, PhD[1], Neda Kharrazi, PsyD[1], Valerie Hoover, PhD[2]

[1]Stanford Health Care, Stanford, CA; [2]Stanford University, School of Medicine, Division of Cardiovascular Medicine, Stanford, CA

With a move towards biopsychosocial conceptualization and integrated health care, psychologists have taken on additional roles in medical settings. Psychologists across various medical settings are paving the way for new roles and treatments to best meet the needs of highly diverse individuals who seek and/or require psychological services. Brief psychological interventions have increased in hospital settings, yet the empirical evidence for Cognitive Behavioral Therapy interventions remains heavily dominated by studies with multiple sessions (e.g. 12) and are often outpatient samples. There is a demand for very brief psychological interventions to support patient care in medical settings, as well as some research to support that such interventions can improve patient outcomes and be cost effective for health care systems. This symposium will discuss some of the current literature, as well as highlight the needs for future research.

Two presenters will focus on acute inpatient interventions for psychiatric patients. One presenter will focus on psychosocial needs specific to cardiac patients, as well as a model for integrated health care in cardiac care. Together, these presenters will explore three main areas of discussion: (1) how to navigate best practices when psychological intervention time is quite limited in medical settings; (2) how to collaborate effectively as a psychologist in an interdisciplinary medical setting; and (3) areas for future research. A combination of empirical and anecdotal evidence will be shared.

Symposium 18A

BUILDING AN EFFECTIVE COGNITIVE BEHAVIORAL THERAPY GROUP IN AN ACUTE INPATIENT PSYCHIATRIC SETTING

Dr. Katherine Eisen, PhD

Implementing an effective CBT group program in an inpatient psychiatric hospital setting presents myriad challenges. Rapport must be established rapidly, groups have frequent patient turnover, and group members present with high levels of symptomology, variable presenting problems, and varying degrees of motivation. However, the inpatient setting presents some unique advantages as well. The entire therapeutic milieu can reinforce the work done in therapy groups, and because group members are inpatients, the frequency of sessions can be much more intensive. Research shows that adding CBT group programming to inpatient psychiatric units is correlated with improvements in patient satisfaction and patient outcomes, reduced length of stay, and lowered readmission rates in the 30 days following discharge. Because CBT is a collaborative, action-oriented, and goal directed form of psychotherapy, it lends itself especially well to brief interventions. Effective inpatient CBT groups maximize impact by targeting themes that will be relevant to individuals who are in crisis, regardless of specific diagnosis. In this presentation, the author will briefly review the literature and will draw from relevant clinical experiences to provide recommendations for adapting traditional CBT group formats to meet the unique needs of acute inpatient settings. Topics will include: 1) Identifying individuals most likely to benefit from CBT groups, 2) Maximizing the impact of brief interventions with selection of appropriate high-yield group topics, 3) Integration of DBT, ACT, and other mindfulness-based approaches into a more traditional CBT-based group curriculum, 4) Selection of appropriate homework topics that allow patients to continue their work outside of group hours, and 5) Strategies for communicating effectively with multidisciplinary staff about group content and homework assignments so that themes covered in group are reinforced throughout the milieu.

Symposium 18B

PROVIDING MEANINGFUL & EFFECTIVE BRIEF INDIVIDUAL PSYCHOLOGICAL INTERVENTIONS IN AN ACUTE INPATIENT SETTING

Dr. Neda Kharrazi, PsyD

Despite the demand for very brief psychological interventions in acute inpatient hospital settings, much of the empirical evidence for Cognitive Behavioral Therapy (CBT) interventions is based on both (1) outpatient treatment and (2) a relatively set number of weekly sessions (e.g., 12 weeks). There is a growing evidence base to support brief CBT interventions in acute inpatient psychiatric settings, but given the highly variable presenting problems, lengths of stay, and multicultural factors, within the context of a multidisciplinary team approach, there is a need for continued research and discussion about what brief individual treatments are most effective for various individuals in acute inpatient settings.

CBT interventions lend themselves well to brief interventions, given the nature of the theory, which can be practiced flexibly to best meet the needs of the particular individual. During this presentation, current brief individual CBT approaches will be explored as they apply within an acute inpatient hospital setting. Given the importance of building rapport quickly under time constraints in such settings, foundational therapeutic factors will be discussed. Case examples will be used to illustrate both the utility of CBT in individual cases, as well as some of the challenges.

Symposium 18C

INTEGRATED BEHAVIORAL HEALTH CARE IN AN OUTPATIENT CARDIOLOGY SETTING: OPPORTUNITIES, CHALLENGES AND CASE ILLUSTRATION

Dr. Valerie Hoover, PhD

Recent policy changes with the Affordable Care Act are increasingly moving the U.S. healthcare system towards integration of mental and physical health services. Broadly, research on integrated care has been shown to improve disease management and early identification of mental health needs, and decrease health care utilization and associated costs to individuals and systems.

Research shows that certain psychiatric disorders occur at higher rates among cardiac patients than in the general population. Furthermore, the presence of certain psychosocial factors and psychiatric disorders – most notably depression, anxiety, anger/hostility, low social support, and chronic stress (including work, marital and caregiving strain) – can place patients at increased risk for adverse cardiac outcomes. Mechanisms are multifactorial and may include chronic activation of the sympathetic nervous system and HPA axis, increased inflammation and endothelial dysfunction, as well as indirect causes such as poor adherence to medical regimens and heart-healthy lifestyle behaviors.

There is a relative paucity of data on integrated care models in the cardiology setting compared to primary care. This presentation will provide a brief overview of common psychosocial needs in cardiac patients, and describe one model of integrated behavioral health care delivery in an outpatient cardiology setting. The presentation will include discussion of clinic needs assessment data, development of a brief assessment and treatment model, psychosocial intervention targets and brief treatment modalities, reimbursement and funding considerations, and outcomes measurement.

Paper Session 1: Is Daily Weighing Best: Research on Weight Tracking 10:45 AM-11:00 AM

THE TRACKING STUDY: LONG-TERM WEIGHT CHANGES BY WEIGHING FREQUENCY CONDITION IN A RANDOMIZED BEHAVIORAL WEIGHT LOSS TRIAL

Jennifer A. Linde, PhD

University of Minnesota, Minneapolis, MN

Background: Weight control trials, community studies, and systematic reviews suggest daily weight tracking promotes better weight loss outcomes than less frequent tracking. However, this has yet to be examined in the context of a larger long-term randomized trial with extended follow-up.

Purpose: The goal of the Tracking Study was to test the effects of study-assigned self-weighing frequency on weight loss outcomes during a 12-month weight loss program with a 12-month follow-up.

Methods: Three hundred thirty-nine adults were recruited and randomized to daily, weekly, or no weighing conditions. All were enrolled in a 12-month weight loss program designed to integrate each weight tracking instruction with standard behavioral weight loss techniques (goal setting, self-monitoring, stimulus control, dietary and physical activity enhancements, lifestyle modifications) and with wireless technology (scales and iPods) for the two tracking conditions. All groups were scheduled for 32 sessions over one year. Participants completed surveys and were weighed by trained study staff every six months from baseline to 24 months.

Results: Mean age of participants was 46.5 ± 10.2 years; 65% were women. Sixty-eight percent were married or partnered and 64% had a college degree. Mean baseline body mass index (BMI) was 33.0 ± 3.6 kg/m^2. Study retention at 24 months was 83.6% (n=280), with no differences between conditions. General linear models assessed 24-month weight change, adjusting for baseline weight. On average, participants regained 3.3 kg from 12 to 24 months. For women, a weak dose-response association for weight change by weighing frequency was observed, such that daily weighers had better weight outcomes on average than weekly weighers, followed by those who did not weigh (-3.87 kg vs. -3.63 kg vs. -2.76 kg, respectively); for men, weekly weighing forestalled weight regain better than daily or no weighing (-7.41 kg vs. -5.22 kg vs. -5.39 kg, respectively).

Conclusions: Results suggest that self-weighing promotes weight loss for adults seeking to lose weight. A potential gender difference in response to weighing remains to be explored.

ASSOCIATIONS OF WEIGHT TRACKING FREQUENCY WITH PSYCHOSOCIAL OUTCOMES OVER 24 MONTHS IN A RANDOMIZED WEIGHT LOSS TRIAL

Jennifer A. Linde, PhD

University of Minnesota, Minneapolis, MN

Background: Some weight control experts argue that frequent body weight tracking may carry adverse psychological consequences, yet scant data have been reported on the effects of differential weight tracking frequencies on psychosocial outcomes over time.

Methods: 339 adults were randomly assigned to track weight daily, weekly, or never during a 12-month behavioral weight loss program with a 12-month follow-up. Participants completed surveys and height/weight measurements every six months from baseline to 24 months. Depression, anxiety, body image, binge eating, and barriers to weight tracking were assessed at the same time points; participants assigned to weighing conditions reported weight tracking perceptions at 6, 12, 18, and 24 months. Repeated measures models assessed changes over time and differences by weighing frequency condition.

Results: Mean age of participants was 46.5 years; the sample was 65% female. Mean baseline body mass index was 33.0 kg/m^2, and 4% of the sample reported binge eating symptoms at baseline. Study retention at 24 months was 83.6%; participants achieved mean weight losses of 8% at 12 months (post-intervention) and 4.4% at 24 months (final follow-up). There were no differences in changes in depression, anxiety, body image, or self-esteem by weighing frequency condition over time (*p*=.46-.87). On average, depression and anxiety remained in the low normal range over the intervention and through follow-up. Body image suggested a neutral to slightly unfavorable opinion of physical appearance at baseline but transitioned to a slightly favorable and stable opinion over time (*p*ppp=.77-.86).

Conclusion: The study was highly successful at assigning weight self-monitoring at varying frequencies without adverse psychological effects.

Paper Session 1: Is Daily Weighing Best: Research on Weight Tracking 11:15 AM-11:30 AM

PREDICTORS AND OUTCOMES OF LAPSES IN DAILY WEIGHING AND PHYSICAL ACTIVITY TRACKING AMONG YOUNG ADULTS IN WEIGHT GAIN PREVENTION

Brooke T. Nezami, PhD, Carmina G. Valle, PhD, MPH, Deborah F. Tate, PhD

University of North Carolina at Chapel Hill, Chapel Hill, NC

Self-monitoring is a key strategy for weight loss and maintenance. However, adherence to self-monitoring in weight control interventions generally declines over time and little is known about predictors of lapses in adherence. The goal of this study was to examine predictors of lapses in daily weighing and wearing PA trackers, and the relationships between lapses in self-monitoring with weight and activity outcomes. Data were drawn from a sample of young adults enrolled in ongoing interventions within the SNAP weight gain prevention study. Participants included in this analysis (N = 161, BMI = 25.2 ± 3.1 kg/m^2, 32.5 ± 4.9 years) had at least five observations of self-monitoring data from a wireless scale and PA tracker within a 90-day interval. A weighing lapse was identified as one or more days without weighing and a PA tracker lapse was identified as one or more days without wearing the tracker. Lapse length in days was calculated for weighing and tracker use. Additional data included transmitted scale weights and steps/day. Generalized estimating equations accounting for repeated observations within individuals were used to evaluate associations between weighing and PA tracker lapses and changes in weight and steps/day. There were 1629 lapses in weighing and 514 lapses in tracker use, with mean lapse lengths of 3.2 (± 4.2) and 3.3 (± 6.1) days, respectively. For weight observations with no lapses (i.e. daily weighing), there was a mean weight change of -0.09 lbs. per day. Every 1-day increase in lapse length was associated with a 0.06-lb. increase in weight since the prior weight observation ($p < .0001$). Predictors of a weighing lapse included any weight gain (vs. loss) since the prior weight observation (OR = 1.20, 95% CI: 1.09, 1.32) and weight change over the prior 7 days, with an increase in odds of a weighing lapse of 1.07 for each 1-lb. increase in weight (95% CI: 1.04, 1.10). PA tracker lapse length was not associated with changes in steps/day or weight between wear days. The only predictor of a PA tracker lapse was weight change over the prior 7 days, with an increase in odds of a PA tracker lapse of 1.08 for each 1-lb. increase in weight (95% CI: 1.02, 1.14). These results suggest that there may be greater barriers to daily weighing as compared to wearing PA trackers, and that weight gain may discourage adherence to self-monitoring. Future research could examine the type and frequency of messaging required to reduce the frequency and length of lapses in self-monitoring.

NONADHERENCE TO DAILY WEIGHING AND ACTIVITY TRACKING IS ASSOCIATED WITH WEIGHT FLUCTUATIONS AMONG BREAST CANCER SURVIVORS

Carmina G. Valle, PhD, MPH, Chantel L. Martin, PhD, MSPH, Deborah F. Tate, PhD

University of North Carolina at Chapel Hill, Chapel Hill, NC

Background: Daily self-weighing (DSW) and daily activity tracking (DAT) have recently been shown to be useful strategies for preventing weight gain among African American breast cancer survivors. However, self-monitoring behaviors vary over time, increasing an individual's risk of weight gain. This study examined the association of nonadherence to DSW and DAT with corresponding weight fluctuations among a sample of African American breast cancer survivors participating in a 6-month pilot intervention trial focused on DSW to promote weight gain prevention.

Methods: Women were randomized into one of three groups: 1) DSW (INT); 2) DSW + DAT (INT+); or 3) delayed intervention control. Intervention participants received a wireless scale and activity tracker (INT+ only) that transferred objective data to a mobile app and website, email lessons on weight control, and tailored feedback on objective weight (and activity data). The intervention encouraged use of DSW as the primary self-monitoring strategy to prevent weight gain. Participants in the INT+ group additionally were encouraged to track their physical activity daily. Nonadherence to DSW was defined as one or more days without a weight measurement, and nonadherence to DAT was defined as one or more days without a bout of physical activity. Generalized estimating equations (GEE) accounting for repeated measurements within individuals were used to examine the association between nonadherence to DSW and weight fluctuations (kg) among women included in both the INT and INT+ groups (n=24; n=2,438 weight measurements). We also used GEE to assess the association of nonadherence to DAT in relation to weight fluctuations among women in the INT+ only group (n=11; n=1,214 weight measurements).

Results: At baseline, women were 52.4 ± 8.2 years of age with BMI of 33.3 ± 5.7 kg/m^2. Over the 6-month study period, women provided on average 119.2 ± 46.0 weight measurements and 120.3 ± 53.5 days with bouts of physical activity. Interruptions in DSW and DAT were associated with weight fluctuations. For every 1-day increase in nonadherence to DSW, weight increased by 0.031 kg (95% CI: 0.012, 0.050; $p < 0.01$). Additionally, weight increased by 0.035 kg (95% CI: 0.019, 0.050; $p < 0.0001$) for every 1-day increase in nonadherence to DAT. During periods of DSW, weight change was, on average, -0.03 kg (-0.04, -0.01; *p* <

0.0001), while during periods of DAT, mean weight change was -0.05 kg (-0.08, -0.02; $p < 0.01$).

Conclusion: Our findings demonstrate, among a sample of African American breast cancer survivors, the significance of DSW and DAT for weight gain prevention. Further research is needed to better understand predictors of nonadherence to DSW and physical activity tracking in larger study populations.

CITATION AND MERITORIOUS AWARD WINNER

A COMPARISON OF REACH, RETENTION, UPTAKE AND SATISFACTION BETWEEN THREE DELIVERY MODES OF FUEL YOUR LIFE

Heather M. Padilla, MS, RDN, LD[1], Heather S. Zuercher, B.S., MPH[2], Melissa Mitchell, M.S.[3], David DeJoy, PhD[4], Mark G. Wilson, HSD[5]

[1]Workplace Health Group, University of Georgia, Athens, GA; [2]University of Georgia, Jefferson, GA; [3]University of Georgia, Athens, GA; [4]College of Public Health, University of Georgia, Athens, GA; [5]University of Georgia/College of Public Health, Athens, GA

Background: A randomized control trial has shown that a worksite translation of the Diabetes Prevention Program, *FUEL Your Life*, can be effectively delivered using three different modes – phone coaching, small group coaching, and self-study. Participants in all conditions lost weight with the phone condition demonstrating significantly greater weight loss and higher costs than the other two conditions. The purpose of this presentation is to describe the feasibility of each delivery modality including strengths and weaknesses.

Methods: The process evaluation framework by Saunders, Evans, and Joshi (2005) was used to compare reach, retention, dose received (uptake), and satisfaction among the three delivery modes. Sources of data include participant surveys and health coach records. Differences between delivery modes were tested using Pearson Chi-Square test and one-way ANOVA.

Results: A total of 660 employees enrolled in the study at three worksites. Twenty-one percent of eligible employees enrolled at the worksite assigned to the phone condition compared to 15% for the small group condition and 9% for the self-study condition. Retention in the program at the end of the intervention was higher in the self-study condition than in the phone and small group conditions and the small group condition had higher retention than the phone condition ($p < 0.01$). The mean number of lessons read was higher for the phone (13.1) and small group (12.4) conditions compared to the self-study condition (9.2; $p < 0.01$). A higher percentage of participants in the group (48%) and phone (43%) conditions reported keeping track of their weight weekly compared to the self-study condition (36%), although these differences were not statistically different ($p=0.13$). More than 90% of participants in all conditions reported that the program provided the information that they

needed to lose or maintain weight and overall satisfaction.

Discussion: Reach in this worksite weight management study was higher for phone and small group coaching conditions compared to the self-study condition. Additionally, participants in the phone and group coaching conditions also reported higher intervention uptake likely attributable to the coaches holding participants accountable for adherence to these elements. Retention was higher for the self-study condition compared to the other two modes of delivery and may differ due to the level of effort needed to participate in the self-study compared to the other conditions and the lack of ongoing contact with a health coach. Despite differences in uptake and retention, satisfaction was similar among the groups. It is important to consider reach, retention, uptake and satisfaction when comparing intervention effectiveness and determining the best way to offer interventions in the future. Differences between the modalities and implications for future research will be discussed.

Paper Session 2: Work Site Wellness Programs to Promote Physical Activity and Prevent Obesity 11:00 AM-11:15 AM

A HOLIDAY WEIGHT MANAGEMENT PROGRAM HELPS EMPLOYEES LOSE WEIGHT

Heather M. Padilla, MS, RDN, LD[1], Mark G. Wilson, HSD[2], Michael Bien, BS[1], Carmen Daniel, BS[3]

[1]Workplace Health Group, University of Georgia, Athens, GA; [2]University of Georgia/College of Public Health, Athens, GA; [3]Georgia Department of Public Health, Atlanta, GA

Introduction: Adult weight gain during the holidays (Nov.-Jan.) averages 0.5 kg though it varies as much as -7 to 4.1 kg among individuals. Holiday weight gain appears to be due to both excess energy intake and decreased expenditure. Previous studies suggest that the weight gained is retained thus likely contributing to the obesity epidemic. This study examined the effects of a team-based weight management program offered in a worksite setting on prevention of holiday weight gain.

Methods: Holiday Survivor is a 10-week program offered to employees at the Georgia Department of Public Health in November – January. Participants form teams of four with coworkers to support one another with mindful eating and physical activity through the holiday season. Pre-test and post-test weight and waist circumference are measured by wellness staff. Additionally participants complete a pre- and post-test survey on physical activity, eating behaviors, social support, and program participation.

Results: In 2015, 102 employees enrolled in the program. Participants had a 2.45 kg reduction in mean body weight ($p < .0001$) and a 1.1 inch reduction in waist circumference ($p < .0001$). Overall, 82% of participants lost some weight and an additional 3% maintained their weight. Self-reported physical activity increased, fast food consumption decreased and fruit and vegetable intake increased. Participants reported that weigh-ins, fitness classes, cash prizes for winners, walk/runs with their team, giveaways, and logging meals were important to their success.

Discussion: A team-based behavioral weight management program was effective for weight loss during the holiday season. Increased physical activity and improved eating behaviors offset typical holiday weight gain. Holiday weight gain should not be considered inevitable. Future research will examine the effects of the program on maintenance of weight loss and positive eating and activity behaviors.

TAKING WELLNESS TO THE BANK: AN INTEGRATED SERVICES WORKSITE WELLNESS PROGRAM FOR BANK EMPLOYEES

Morgan S. Lee, PhD, MPH, CPH[1], Paige Whitney, Health Promotion, MSc[2], Mary Ann Kluge, BS, MS, PhD[3]

[1]University of Colorado - Colorado Springs, Colorado Springs, CO; [2]Assistant Program Director, Colorado Springs, CO; [3]Beth-El College of Nursing and Health Sciences University of Colorado Colorado Springs, Colorado Springs, CO

American adults spend half their waking time at work, often in highly stressful and sedentary roles. Thus, the workplace is a critical environment for healthy lifestyle choices regarding stress management, physical activity, and diet. Increasingly, employers are adopting worksite wellness programs (WWPs) to promote healthy behaviors and disease management. Although experts have called for multidimensional and integrated approaches to WWPs, few of these programs meet such standards.

The Kirkpatrick Bank Workplace Wellness program (KBWWP) uses an integrated model to provide comprehensive assessment of several domains of health and wellbeing, personalized behavior change recommendations and coaching, and an array of related services. KBWWP aims to help participants become more educated, mindful, and proactive about healthy lifestyle choices and to make sustainable health behavior changes that produce long-term benefits including improved health and reduced healthcare utilization. Additionally, KBWWP will evaluate which program components have the greatest impact, what intervention dose is needed to produce significant improvements, and how behavior change influences work stress, work productivity, and healthcare utilization.

The KBWWP process begins with a health coach consultation as well as physical activity (PA) and nutritional assessments, after which the providers' recommendations are used to create an integrated wellness plan. Participants complete an 8-week engagement phase with opportunities including wellness services (e.g., personal training and nutrition education classes) and additional appointments with service providers. A mid-program evaluation is then conducted, and new recommendations are formulated for an 8-week maintenance phase, which is followed by a final assessment.

The KBWWP has reached the end of the 8-week engagement phase, and 16 of the 19 participants enrolled in the program have completed both baseline and mid-program assessments. Participants' weekly minutes of moderate and vigorous PA increased from baseline (*M* = 173.00, *SD* = 163.43) to mid-program (*M* = 217.97, *SD* = 132.07), and sugar-sweetened beverage intake decreased from baseline (*M* = 0.78, *SD* = 0.79) to mid-program (*M* = 0.50, *SD* = 0.63). Participants were confident they could maintain the behavior changes they made in the engagement phase (*M* = 8.15, *SD* = 1.68; 1-10 scale), and additional results are forthcoming at the end of the maintenance phase.

Paper Session 2: Work Site Wellness Programs to Promote Physical Activity and Prevent Obesity 11:15 AM-11:30 AM

DOES A WORKPLACE PHYSICAL ACTIVITY PROGRAM WORK?

Rebecca Ellis, PhD, Duke Biber, MA

Georgia State University, Atlanta, GA

Objectives: Desire2Move (D2M) is an 8-week team-based program designed to encourage university employees to meet the physical activity (PA) guidelines through participation in moderate-to-vigorous physical activity (MVPA). The purpose of this study was to evaluate D2M using the RE-AIM framework. ***Methods:*** During D2M, departments competed as teams to accumulate the greatest average mins of MVPA. Each team selected a captain who sent weekly emails with reminders, motivational tips, and team standings. Each team member recorded minutes of MVPA using the *MapMyRun* mobile application or website. Graduate assistants were assigned to specific teams to collect minutes. One week after D2M, an electronic survey link was emailed to assess adverse events, program satisfaction and implementation (1 = strongly disagree, 5 = strongly agree), and individual maintenance of MVPA (Godin Leisure Time Exercise Questionnaire). ***Results:*** Twelve departments were invited to participate in D2M, but only nine agreed (75.0% adoption rate). From these departments, 157 employees volunteered for the 8-week program (26.7% participation rate), and 72 consented to complete the follow-up survey (45.9% response rate). During the program, participants recorded a weekly average of 233.50 mins of MVPA and only 1 participant reported an adverse event. Participants also reported the program encouraged them to be more active than usual (M = 3.74, SD = 1.27). Participants reported satisfaction with D2M by indicating they would participate in future programs (M = 4.35, SD = 1.05) and would recommend it to their co-workers (M = 4.40, SD = 1.08). Participants perceived the program was well implemented by captains emailing information about how to record PA (M = 4.51, SD = 0.94), weekly reminders (M = 4.54, SD = 0.95), and weekly team standings (M = 4.62, SD = 0.93). Finally, participants reported maintaining their PA since the end of the program (M = 3.06, SD = 0.67) and reported an average of 53.51 METS (SD = 39.37) of MVPA. ***Conclusions:*** The RE-AIM evaluation revealed the program effectively, safely, and satisfactorily encouraged university employees to meet the PA guidelines while demonstrating a very good adoption rate, but a low participation rate. The results provide support for the translation of D2M to other workplace settings, but strategies that improve reach must be identified.

Ultraviolet (UV) exposure from the sun or indoor tanning devices during adolescence increases skin cancer risk. A UV light photograph reveals skin damage caused by UV exposure. This skin damage is not visible in a standard (visible light) photograph. Immediately after viewing a UV photograph of the face, adults report increased sun protection intentions, stronger perceptions of photoaging susceptibility and more negative tanning attitudes. To our knowledge, our study is the first randomized controlled trial (RCT) to examine immediate effects of UV photography on socio-cognitive factors in young adolescents. We conducted a 2-arm cluster-RCT in 12 Houston-area middle schools. Schools were pair-matched and randomized to intervention (UV photography and brief education) or comparison (brief education only) before participants (N=290 7th and 8th graders) completed baseline. Intervention-school participants were shown their standard and UV photographs side-by-side for comparison. Study personnel reviewed with participants the photographs, including any skin damage visible in the UV photograph. Personnel then provided brief education by reviewing with participants a skin cancer prevention handout. Comparison-school participants received only brief education. Immediately after the intervention/comparison session, participants completed a post-intervention survey. The trial design was conducted in 2015 (4 schools, N=98) and 2016 (8 schools, N=192) and data were combined. Generalized linear mixed models were conducted, with treatment condition as a fixed effect and a school-specific random intercept to account for the nested design. Analyses were adjusted for age, race, ethnicity and study year. The majority of participants were female (71.7%), white (73.6%) and not Hispanic or Latino (73.7%). Mean age was 13.2y (SD=.75, range 12-15y). There was a significant, positive intervention effect on sun protection intentions (effect=.16, SE=.05,

P < .01): the intervention group showed a greater positive change from baseline to post-intervention in the sun protection intentions score, which was the average of four items that assessed intention to use sunscreen, wear a sleeved shirt, wear a hat and stay in the shade. There were no significant effects on intentions to sunbathe or indoor tan, tanning outcome expectations, sociocultural influences to tan, perceived severity of photoaging or perceived skin cancer risk. Results suggest UV photography may be a valuable intervention for increasing sun protection intentions in young adolescents. UV photography may be less effective in immediately affecting other socio-cognitive factors, such as those that may require more time to demonstrate change. A 3-month follow-up is underway to examine longer term effects of UV photography on socio-cognitive factors and UV exposure and protection behaviors in adolescents.

Paper Session 3: Sun Safety and Preventing Skin Cancer among Youth 11:00 AM-11:15 AM

INDOOR TANNING AMONG DIVERSE U.S. YOUTH: RESULTS FROM A NATIONAL SAMPLE

Aaron Blashill, Ph.D.

San Diego State University, San Diego, CA

Sexual minority males have one of the highest known prevalence rates of skin cancer, at 4.3% to 6.6% (an increased odds of 1.5 to 2.0) compared to heterosexual males. One likely explanation for this health disparity is sexual minority males' use of indoor tanning, a Group 1 carcinogen. However, no known studies have examined indoor tanning by sex, sexual orientation, and race/ethnicity, casting uncertainty regarding which groups are most vulnerable for developing skin cancer.

Data were used from the 2015 Youth Risk Behavior Survey (YRBS), a nationally representative survey that examines the prevalence of health risk behaviors among 9-12 grade public and private school students. Sexual minority status was defined from responses to two items: sexual identity and sex of sexual partners, with sexual minorities denoted as participants who reported a non-heterosexual identity or reported sex with a member of their own sex (a common approach in the field). Past 12 month indoor tanning was dichotomized as one or more times vs. none. The total employed sample was N = 10,660, with 1,256 sexual minority participants (21.0% females; 5.6% males). Logistic regressions were used, with independent variables of sex, sexual orientation and race/ethnicity (i.e., dummy coded Black, Hispanic, with White as the referent). Complex Samples in SPSS 24 was used to account for weighting, cluster, and stratification.

Significant three-way interactions were revealed, thus, analyses were stratified by race/ethnicity. Among Black participants, there was a main effect of sexual orientation (OR = 6.5, 95% CI: 3.3, 12.9, $p < .01$) and sex (OR = 2.9, 95% CI: 1.2, 7.3, $p = .02$), with sexual minorities and males reporting elevated indoor tanning. Among Hispanic participants, there was a main effect of sexual orientation (OR = 5.7, 95% CI: 2.3, 14.2, $p < .01$), with sexual minorities reporting elevated indoor tanning. Among White participants, there was a sexual orientation by sex interaction ($F_{1,35} = 28.0$ $p < .01$). Follow-ups revealed that sexual minority status was a risk factor within males (OR = 3.1, 95% CI: 1.3, 7.7, $p = .01$), and a buffer variable within females (OR = .41, 95% CI: .24, .73, $p < .01$).

Results highlight the need to incorporate sex, sexual orientation, and race/ethnicity when developing skin cancer prevention programs for youth. For example, Black sexual minority males reported the highest prevalence of indoor tanning, a rate equivalent if not higher than White females. Clinicians working with sexual minority males, particularly males of color should consider assessing use of indoor tanning during routine evaluations. Future research would benefit from exploring motivations to tan among diverse groups of adolescents, as sexual minorities may use indoor tanning as strategy to regulate excess negative affect.

Paper Session 3: Sun Safety and Preventing Skin Cancer among Youth 11:15 AM-11:30 AM

SUNBURN, SUN PROTECTION AND TANNING BEHAVIOR IN YOUNG ADOLESCENTS

Mary K. Tripp, PhD, MPH[1], Jian Wang, PhD[2], Payal Pandit Talati, MPH[1], Martha A. Askins, Ph.D.[1], Robert Dellavalle, MD, PhD, MSPH[3], Carmen Galvan, MA[4], Michael Davies, MD, PhD[5], Jeffrey E. Gershenwald, MD[1], Susan Peterson, PhD, MPH[5]

[1]The University of Texas MD Anderson Cancer Center, Houston, TX; [2]UT MD Anderson Cancer Center, Houston, TX; [3]University of Colorado Denver, Denver, CO; [4]The University of Texas MD Anderson Cancer Center, Pearland, TX; [5]MD Anderson Cancer Center, Houston, TX

Overexposure to ultraviolet (UV) radiation from the sun and UV exposure from indoor tanning during adolescence increases skin cancer risk. Very little is known about UV exposure and sun protection behaviors in young adolescents in the US. We analyzed baseline data from participants (N=290) in 12 Houston-area middle schools enrolled in a group-randomized trial of a UV photography intervention. The trial design was conducted in 2015 (4 schools, N=98) and 2016 (8 schools, N=192) and data were combined. The majority of adolescents were female (71.7%), white (73.6%) and not Hispanic or Latino (73.7%). Mean age was 13.2y (SD=.75, range 12-15y). Sun protection practice “most of the time” or “always” varied by behavior: using sunscreen (31.4%), wearing a shirt with sleeves covering the shoulders (68.7%), wearing a hat (5.9%) and staying in the shade (13.1%). Averaging behavior scores (1-5 “never” to “always” scale) showed adolescents “sometimes” practiced sun protection (M=2.88, SD=.52). More adolescents reported intentions to use sun protection in the next 3 months: sunscreen (87.6%), sleeved shirt (84.5%), hat (49%) and shade (64.3%). A 4-point scale showed moderate intentions overall (M=2.87, SD=.45). Sunburn in the past year was reported by 81.1%. One adolescent (.3%) reported using an indoor tanning device in the past year. Five adolescents (1.7%) intended to indoor tan in the next 3 months. Sunbathing “often” or “always” was reported by 10.4%. Intention to sunbathe in the next 3 months was reported by 33.5%. Some wished they had a tan like people on TV (14.1%) or responded that friends said they looked good when tan (35.0%). On 4-point scales, adolescents perceived negative tanning outcome expectations (mean=2.10, SD=.45) and moderate perceptions about the severity of photoaging (mean=2.75, SD=.68). Most (75%) perceived themselves unlikely to develop skin cancer. In multivariable analyses, sun protection behavior correlates that remained significant were stronger sun protection intentions, lighter skin color and male sex. Significant sunbathing correlates were stronger sunbathing intentions, weaker sun protection intentions, more positive tanning outcome expectations and female sex. Results show that early adolescence is a critical time for intervention to reduce UV exposure. Adolescents reported sunbathing, significant sunburn history and inadequate sun protection. Reported

intentions to sunbathe and indoor tan suggest that more adolescents planned to practice these risky behaviors over the next few months. Intentions to sunbathe and use sun protection and tanning outcome expectations are important factors to influence with interventions designed to reduce UV exposure in adolescents.

Paper Session 3: Sun Safety and Preventing Skin Cancer among Youth 11:30 AM-11:45 AM

PHYSICAL ACTIVITY MOTIVES AND SUN SAFETY AMONG TEENS

Kasey Morris, PhD[1], Frank Perna, EdD, PhD[2]

[1]National Cancer Institute, Bethesda, MD; [2]National Cancer Institute, Rockville, MD

Recent evidence suggests that physically active adults have higher melanoma rates, ostensibly via relatively greater incidence of sun exposure and sunburn. Adolescents, especially active teens, may also experience greater sun exposure than adults, and sunburn during youth is especially predictive of melanoma later in life. Using data on adolescents (N = 1661) from the National Cancer Institute's Family Life, Activity, Sun, Health, and Eating (FLASHE) national survey, our purpose was to determine if physical activity level and motivational differences for physical activity are associated with sun exposure and sun safety. After controlling for demographic factors, results demonstrated a 3-way interaction between physical activity, sports performance motivation, and history of sunburn on sunscreen use, b = .001, p = .029. Among highly active teens with a history of sunburn (at least one in the past 12 months), sunscreen use was reportedly greater among those high on sports performance motivation. However, sports performance motivation for physical activity was also associated with increased likelihood of sunburn (OR = 1.23, p = .008), regardless of physical activity level. There was also an interaction between appearance motivation and sunbathing on sunscreen use, b = .120, p = .023. Appearance motivation for physical activity was positively associated with sunscreen use, but only among adolescents who engage in sunbathing (b = .078, p = .029). Motivation for physical activity may play an important role in understanding why adolescents engage in sun protection strategies. For at risk teens (i.e., those with a history of sunburn), physical activity and high sports motivation was associated with greater reported sunscreen use, but this relationship was not found among those without a history of sunburn. This may reflect an inattentiveness to sun exposure when involved in sports and outdoor physical activity, suggesting the need for greater vigilance and infrastructure to support sun safety in physical activity contexts (e.g., sunscreen availability). In contrast, adolescents with high appearance motivation for physical activity and a sunbathing history reported greater sunscreen use, suggesting a possible strategic form of sun protection (i.e., to tan, but not burn). These results highlight the importance of considering multiple motives for physical activity and possible behavioral phenotypes for effective policy change and health behavior promotion related to sun safety.

USING SELF-DETERMINATION THEORY TO EXAMINE PROSPECTIVELY THE RELATION OF BODY SATISFACTION WITH FITBIT-ASSESSED EXERCISE

Miriam H. Eisenberg, Ph.D.[1], L. Alison Phillips, PhD[2]

[1]Eunice Kennedy Shriver National Institute of Child Health and Human Development, NICHD, ARLINGTON, VA; [2]Iowa State University, Ames, IA

Regular physical activity (PA) is critical for promoting health and preventing disease but it declines in young adulthood. Body dissatisfaction, which increases in young adulthood, could exacerbate this decline in PA. Research is needed to test this association and examine the mechanisms through which this occurs. Previous research shows that components of Self-Determination Theory (SDT), mainly autonomous motivation and psychological needs satisfaction, mediate this association cross-sectionally using self-reported PA. However, intrinsic goals (e.g., exercising to improve health versus appearance) may mediate this association as well, which would indicate an additional point for intervention. Further, objective PA measurement and longitudinal data are needed to assess these associations more precisely. The current study examined the extent to which intrinsic goals, psychological needs satisfaction, and autonomous motivation mediated the association of body satisfaction with PA measured objectively.

Participants (n=121, 73% White, mage=25y, BMI =24kg/m2, 75% female) reported their body satisfaction and motivation, goals, and psychological needs satisfaction for PA. Fitbits recorded their PA over the following two weeks; PA was operationalized as the proportion of days with an exercise session/days wearing the Fitbit. Bootstrapping process macro 6 was used to test whether the proposed SDT framework that included intrinsic goals mediated the association of body satisfaction with PA adjusting for gender and BMI.

Body satisfaction was significantly associated with PA ($\beta = 0.23$, p=0.03). Bootstrapping revealed support for the hypothesized model where intrinsic goals, psychological needs satisfaction, and autonomous motivation all mediated the association of body satisfaction with PA (Standardized Indirect Effect =0.0003, 95%CI: 0.0000, 0.0013).

Findings support and extend previous literature by using objective and prospective data to identify intrinsic goals as an additional point for intervention. Based on these findings, researchers and health professionals could improve PA in this age group by promoting body satisfaction or targeting goals, needs satisfaction, or autonomous motivation directly. For example, researchers could promote health-focused (intrinsic) versus appearance focused (extrinsic) PA goals. The strengths and limitations to using Fitbits for data collection will also be discussed.

Paper Session 4: What Drives Activity? Motivation Science 11:00 AM-11:15 AM

MOTIVATIONAL PREDICTORS OF PHYSICAL ACTIVITY AND SEDENTARY BEHAVIORS AFTER REHABILITATION: A 6-MONTH PROSPECTIVE STUDY

Guillaume Chevance, PhD Student[1], Nelly Héraud, PhD, Research director[2], Nicolas Oliver, Medical Doctor[2], Julie Boiché, PhD, Assistant Professor[1]

[1]University of Montpellier, Montpellier, Languedoc-Roussillon, France; [2]Groupe 5 Santé, Lodeve, Languedoc-Roussillon, France

Two-third of the patients who followed a Pulmonary Rehabilitation (PR) program is insufficiently active 6 months after. Previous studies have consistently highlighted that exercise tolerance was a significant predictor of active behaviors after PR. Beyond this physiological variable, motivation may also influence patient's behaviors. Grounded in contemporary dual models, this study sought to examine the contribution of controlled (intentions) and automatic (implicit attitudes) motivational processes in the physical activity (PA) and sedentary behaviors (SB) adopted after PR.

Patients with chronic diseases (N=62, Mage=61 years, MBMI=29kg/m²) were recruited at the end of a 5-week PR. Patients were evaluated on their exercise tolerance with walking tests. Intentions to practice regular PA and to limit SB were measured by questionnaires. Implicit attitudes (PA versus SB) were measured with an Implicit Association Test. PA and SB were evaluated by questionnaires 6 months after PR. Regression were conducted for PA and SB, respectively, with exercise tolerance, intentions and implicit attitudes as independent variables, and behaviors as dependent variables.

Regarding PA, exercise tolerance ($\beta=.43$; $P < .001$) and implicit attitudes ($\beta=.29$; $P=.020$) were significant predictors. Intentions were not associated to PA ($\beta=.10$; $P=.416$). The equation was statistically significant: $F(3,53)=7.13$; R^2adjusted=.30; $P < .001$. Regarding SB, exercise tolerance ($\beta=-.45$; $P < .001$) was a significant predictor. A statistical tendency was observed for implicit attitudes ($\beta=-.21$; $P=.097$), but intentions were not associated to SB ($\beta=.15$; $P=.247$). The equation was statistically significant: $F(3,51)=5.98$; R^2adjusted=.27; $P=.002$.

Implicit attitudes are significantly associated with PA 6 months after PR, independently from patients' exercise tolerance. Hence, this variable may represent a relevant target for future behavioral interventions. Studying independently implicit attitudes for PA and SB is now needed to understand the patterns of relationships between those

motivational processes and behaviors. A replication study with an objective measure of behaviors is also required.

SELF-REGULATION AND MOTIVATIONAL RESULTS OF A WEARABLE ACTIVITY MONITOR INTERVENTION

Elizabeth J. Lyons, PhD[1], Maria Swartz, PhD, MPH, RD, LD[2], Zakkoyya Lewis, BS[3], Eloisa Martinez, BS, CCRP[4]

[1]The University of Texas Medical Branch, Galveston, TX; [2]UTMB, Missouri City, TX; [3]University of Texas Medical Branch, Bellflower, CA; [4]University of Texas Medical Branch-Galveston, Texas City, TX

Background: As adults age, their physical activity decreases, leading to increased risk of numerous negative health outcomes. Increasing intrinsic motivation (i.e., motivation related to intrinsic enjoyment) and self-regulation can increase physical activity. It has been hypothesized that mobile applications (apps) combined with wearable activity monitors may be an effective method of increasing both motivation and self-regulation. However, to our knowledge, this hypothesis has not been tested. Thus, the purpose of this study was to investigate the effect of an intervention that used an app and wearable monitor on intrinsic motivation and self-regulation (self-efficacy, goal setting, and planning).

Methods: Adults (N = 40) aged 55 – 79 who self-reported as sedentary (< 60 minutes physical activity/week) were randomized to a 12-week intervention or to a wait-list control. A Jawbone Up24 wearable monitor, a tablet with the Up app installed, and weekly brief telephone counseling were provided for the intervention group. Intrinsic motivation was tested using the Behavioral Regulations in Exercise-2 questionnaire. Barrier and task self-efficacy were assessed using the Barriers Self-Efficacy Scale and Rogers and colleagues' Task Self-Efficacy Scale. Goal setting and planning was assessed using Rovniak and colleagues' measure.

Results: Participants were 61.5 ± 5.6 years old, with a BMI of 30.3 ± 3.5 kg/m^2, 85% female and 65% White. Analyses of covariance comparing the intervention to the wait-list group, controlling for baseline values, found significant and large effects for intrinsic motivation ($p = .007$, partial $\eta^2 = .18$), task self-efficacy ($p = .009$, partial $\eta^2 = .17$), barrier self-efficacy ($p = .003$, partial $\eta^2 = .22$), goal setting ($p < .001$, partial $\eta^2 = .41$), and planning ($p = .012$, partial $\eta^2 = .16$). The intervention group at 12 weeks reported 65% confidence to overcome barriers, 79% confidence to complete activity tasks, and intrinsic motivation of 3.0 on a 1 to 5 scale.

Discussion: As hypothesized, an intervention using an app and wearable monitor increased intrinsic motivation, self-efficacy, goal setting, and planning. The large effect sizes found in this pilot study suggest that these systems hold promise for targeting specific theoretical constructs associated with behavior change.

Paper Session 4: What Drives Activity? Motivation Science 11:30 AM-11:45 AM

THE RELATIONSHIP BETWEEN SELF-EFFICACY, MOTIVATION, SOCIAL-SUPPORT AND EXERCISE IDENTITY

Zakkoyya Lewis, BS[1], Maria Swartz, PhD, MPH, RD, LD[2], Eloisa Martinez, BS, CCRP[3], Elizabeth J. Lyons, PhD[4]

[1]University of Texas Medical Branch, Bellflower, CA; [2]UTMB, Missouri City, TX; [3]University of Texas Medical Branch-Galveston, Texas City, TX; [4]The University of Texas Medical Branch, Galveston, TX

Introduction: Physical inactivity is a prominent health concern. Physical activity interventions that integrate social support or studies that are grounded in behavioral theory (e.g. Social Cognitive Theory, Self-Determination Theory) have been implemented to change behavior. One concept that is not often evaluated in these studies is exercise identity. Identity may work with other behavioral techniques to add meaning and value to exercise which can elicit behavior change. The purpose of this investigation was to investigate the relationship between self-efficacy, social support, motivation and exercise identity.

Methods: Baseline data from a physical activity intervention were used. Participants (n=40) enrolled in the intervention were 18-69 years of age, inactive, and overweight or obese (body mass index 25-35 kg/m^2). Self-reported measures were used to assess self-efficacy, motivation, social support, and exercise identity. Self-efficacy was divided into task and barrier self-efficacy using the scale developed by Rogers et. al. The Behavioral Regulation in Exercise Questionnaire-2 was used for motivation and included subscales for amotivation, external, introjected, identified, and intrinsic regulation. Perceived family and friend social support was estimated from the Social Support and Exercise Survey. Exercise identity was based off the Anderson measure. Bivarate Pearson correlations were used to identify significant relationships between questionnaire subscales and exercise identity.

Results: On average, participants were 46.7 years old with a body mass index of 29.9 kg/m^2. Most participants were female (55%) and non-Hispanic White (65%). Barrier self-efficacy (r=0.53; p

Conclusion: Exercise identity is strongly correlated to particular subsets of commonly used behavioral constructs and strategies. Future research should evaluate the causal pathway between these variables and investigate the influential differences between barrier and task self-efficacy in addition to family and friend support. Furthermore, researchers should identify

methods to incorporate barrier self-efficacy and family support within the context of Self-Determination Theory to enhance motivation.

Paper Session 5: Depression in Diverse Populations 10:45 AM-11:00 AM

RELAPSE PREVENTION IN MAJOR DEPRESSIVE DISORDER: 24-MONTH FOLLOW UP OF MINDFULNESS-BASED COGNITIVE THERAPY VS. ACTIVE CONTROL

Amanda J. Shallcross, ND, MPH[1], Emily C. Willroth, MA[2], Aaron Fisher, PhD[3], Iris B. Mauss, PhD[4]

[1]New York University School of Medicine, New York, NY; [2]University of California Berkeley, Berkeley, CA; [3]University of California, Berkeley, berkeley, CA; [4]University of California, Berkeley, Berkeley, CA

Background: Studies demonstrating the efficacy of mindfulness-based cognitive therapy (MBCT) for depression relapse prevention and symptom reduction have primarily compared it to treatment as usual and have scarcely examined outcomes beyond 12 months.

Objective: We evaluated the comparative effectiveness of MBCT versus an active control condition (ACC) for depression relapse prevention and depressive symptom reduction over a 2-year follow up.

Method: Participants (*n*=92) in remission from major depressive disorder with residual depressive symptoms were randomized to an 8-week MBCT or a validated ACC intervention that is structurally equivalent to MBCT and controls for non-specific effects (e.g., interaction with a facilitator, perceived social support, outcome expectations). MBCT is a standardized intervention that combines training in mindfulness and cognitive therapy. The ACC was based on the 'Health Enhancement Program' developed as a control condition for mindfulness interventions by researchers at the U. of Wisconsin and NIH. It combines training in physical activity, nutrition, and music therapy. Both interventions were delivered according to their published manuals.

Results: Intention-to-treat analyses indicated no differences between MBCT and ACC in incidence or time to relapse over a 2-year follow up (Fisher's *p*=.65; Hazard ratio=.77, CI [.35-1.68], *p*=.52). Piecewise analyses using mixed effects regression indicated significant reductions in depressive symptoms for both groups over year 1, after which both groups

experienced a marginal rebound of depressive symptoms. Group x Time interactions indicated differential symptom trajectories up to year 1. During the treatment period, the ACC group experienced steeper declines in symptoms. From post-treatment to year 1, the MBCT, but not the ACC group continued to experience symptom declines.

Conclusions: Over a 2-year follow up, MBCT did not differ from an ACC on depression relapse rates or symptom reduction, suggesting that the ACC is as effective as MBCT for improving depression outcomes. The trajectory of symptomatic improvement that favored MBCT after the treatment period was not maintained after year 1. These findings underscore the importance of comparing psychotherapeutic treatments to ACCs to isolate specific versus nonspecific therapeutic components and to test the comparative effectiveness of approaches that may have differential cost and dissemination advantages.

Paper Session 5: Depression in Diverse Populations 11:00 AM-11:15 AM

THE IMPORTANCE OF BASELINE PAIN, FATIGUE, SLEEP & PHYSICAL ACTIVITY: PREDICTING CHANGE IN DEPRESSION IN ADULTS WITH MS

Karlyn A. Edwards, B.A.

University of New Mexico, Albuquerque, NM

Individuals with Multiple Sclerosis (MS) often suffer from a myriad of symptoms that place them at higher risk for developing depression. These symptoms include pain, fatigue, and poor sleep quality, and limited engagement in physical activity. However, little is known about the impact of these symptoms on the course of depression over time. The current study examined baseline levels of pain, fatigue, sleep quality, and physical activity level to determine if they predicted either clinical improvement or development of depression 3.5 years later. The study involved 489 adults with a diagnosis of MS, who received two mail in surveys that were 3.5 years apart. A PHQ-9 cut off score of ^{3} 10 was used to indicate probable major depression and scores < 10 indicating a sub-clinical level of depression. For the analysis, two binary linear regressions were conducted. The first regression examined the role of baseline pain, fatigue, sleep quality, and physical activity in predicting the likelihood that non-depressed individuals at baseline later became depressed at follow up. The second binary linear regression examined the role of baseline pain, fatigue, sleep quality, and physical activity in predicting the likelihood that depressed individuals at baseline clinically improved at follow up. Both regressions also controlled for age, sex, and diagnosis severity. The sample was primarily female (82%), White/Caucasian (94%), highly educated (with 83% receiving at least some college), and diagnosed with relapsing-remitting MS (53%). Our findings indicated that poorer sleep quality and increased fatigue at baseline predicted the development of depression (PHQ-9 ^{3} 10) 3.5 years later among those not depressed baseline. None of the study factors predicted the improvement of depression among those classified as depressed at baseline. These findings indicate that clinical interventions should emphasize treatment of fatigue levels and sleep quality among those with MS to help prevent the future development of depression, and that pain and physical activity level may not be as important. Concurrently, the findings indicate that these factors may also not be important when examining the long term improvement of depression among those with MS.

Learning Objective 1: Describe the impact of pain, fatigue, sleep quality, and physical activity on depression among those with MS.

Learning Objective 2: Discuss the implications of sleep quality and fatigue contributing to the future development of depression over and above pain and physical activity.

Learning Objective 3: Discuss other possible factors (besides pain, fatigue, sleep quality, and physical activity) that may contribute to the improvement of depression.

Paper Session 5: Depression in Diverse Populations 11:15 AM-11:30 AM

MATERNAL DEPRESSIVE SYMPTOMS AND LENGTH OF RESIDENCE IN THE US ARE POSITIVELY RELATED TO OBESITY AMONG LOW-INCOME LATINA MOTHERS

Ana Cristina. Lindsay, DDS, MPH, Dr.PH[1], Mary L. Greaney, PhD[2], Julie A. Wright, PhD[3], Sherrie Wallington, PhD[4], Anne Hunt, Sc.D.[5]

[1]University of Massachusetts Boston, Boston, MA; [2]University of Rhode Island, Kingstom, RI; [3]UMass Boston, Boston, MA; [4]Georgetown University Medical Center, Lombardi Comprehensive Cancer Center, Rockville, MD; [5]Hunt Consulting Associates, Thetford Center, VT

Background: Latinos are the largest and fastest growing minority population group in the United States (US). Low-income Latina women are at elevated risk of being obese, making obesity prevention a pressing public health concern in this population. Both depressive symptoms and obesity are modifiable factors that can improve the health of women of childbearing-age and their children. The purpose of this study was to examine the association between maternal depressive symptoms and obesity among low-income, Latina women of childbearing age.

Methods: Participants (n=147) were low-income mothers enrolled in the "*Latina Mothers' Child Feeding Practices and Styles (LMCFPS) Study",* a cross-sectional study examining psychosocial and cultural influences on child feeding practices and styles of low-income Latina mothers of preschool-aged children. Women were eligible to participate if they were Latina, mothers, eligible for or enrolled in the Special Supplemental Nutrition Program for Women, Infants and Children and living in Rhode Island. Enrolled participants completed an interviewer-administered survey in Spanish administered by bilingual interviewers in the state of Rhode Island.

Results: Obesity (34%; ≥ 30kg/m(2)) and elevated depressive symptoms (28.3%; CES-D ≥ 16) were prevalent in this low-income, majority immigrant (69.4%) female Latina sample. Mothers with elevated depressive symptoms (Center for Epidemiologic Studies Depression Scale score ≥ 16) had increased odds of being obese [odds ratio (OR) = 2.80, 95% CI: 1.24–6.33]. Additionally, length of residence in the US was associated with increased odds of obesity (OR = 1.05, 95% CI: 1.02–1.09).

Conclusions: The present study adds to the understanding of the importance of maternal depression as a modifiable risk factor for obesity in Latina women of childbearing-age. Findings underscore the need for screening and interventions for maternal depressive symptoms for Latina women of childbearing-age.

Paper Session 5: Depression in Diverse Populations 11:30 AM-11:45 AM

COMPLEX PATIENTS' DESCRIPTIONS OF DEPRESSION SYMPTOMS, CAUSES, AND ILLNESS INTERACTIONS: A QUALITATIVE PRIMARY CARE STUDY

Ernesto Moralez, PhD[1], Main Debbi, PhD[2]

[1]New Mexico State University, Las Cruces, NM; [2]University of Colorado, Denver, CO

The recognition and treatment of depression among complex patients (patients with concomitant illnesses) remains a significant challenge for primary care providers. Understanding of the complex patient's experience with depression is often missing during the clinical encounter, improve patient-provider dialogue, and inform treatment options and clinical interventions. The aim of this qualitative study was to elucidate how complex patients describe causes and symptoms of depression and how it impacts their health. A purposive sample of 19 complex patients receiving their primary care from Denver Health and Hospitals were interviewed. Questions focused on how patients understand, experience, and negotiate depression, along with their perceptions of the relationship between their mental and physical health. Each participant had at least one chronic illness and were screened for depression using the PHQ-9. All handling of the data was done using ATLAS.ti. The semi structured interviews were analyzed thematically using the Iterative Process Model and organized using constructs discussed in Kleinman's Illness Narratives. Three primary themes emerged about the connection between physical illness and depression: 1) the burden of physical illness is a contributing source of depression, 2) simply being a complex patient causes depressive symptoms, and 3) the increasing severity of physical illnesses causes feelings of distress and hopelessness. Specific examples of how patients described the relationship included feelings of sadness because of a loss of social and daily functioning (e.g., loneliness) normalcy (e.g., unemployment), and hopelessness (e.g., feeling defeated because of having illnesses with no hope for remission). Patients identified other causes including financial troubles (e.g., health care costs associated with multiple illnesses), family stressors (e.g., divorce, family estrangement), and bereavement/personal loss (e.g., death of a loved one). The results indicate that patients perceive the causes and symptoms of their depression as connected to contextual factors often not mutable in primary care treatment. Traditional approaches for depression may not be impactful for complex patients if they perceive their depression as a result of their health status and not as a separate coexisting illness. Given this, providers should ask patients to describe their experience with depression to effectively target the patient's perceived sources of depression.

DAILY RELATIONSHIPS BETWEEN RESPONSES TO PROBES OF METHAMPHETAMINE USE AND ANTIRETROVIRAL MEDICATION ADHERENCE

Elizabeth Pasipanodya, Ph.D.[1], Jessica L. Montoya, M.S.[2], Anya Umlauf, MS[3], Alexandra Rooney, B.A.[4], Ben Gouaux, BA[1], David J. Moore, Ph.D.[5]

[1]University of California, San Diego, San Diego, CA; [2]SDSU/UCSD Joint Doctoral Program in Clinical Psychology, San Diego, CA; [3]UCSD, San Diego, CA; [4]University of California San Diego, San Diego, CA; [5]UCSD HIV Neurobehavioral Research Program, San Diego, CA

Background: Adherence to antiretroviral therapy (ART) is key to improving the health outcomes of those living with HIV, as good ART adherence aids HIV suppression and prevents adverse events like ART resistance. Methamphetamine (meth) use, however, poses a significant barrier to ART adherence. **Method:** In an intervention study that aimed to promote ART adherence, a text message assessing meth use was sent to 71 (22 control and 49 intervention) HIV+ meth users for 42 days. We examined the daily associations between self-report of meth use via text message (“no”, “yes”, or non-response) and ART adherence measured by the Medication Event Monitoring System (MEMS) by conducting concurrent and lagged analyses. Overall, participants reported meth use on 19.2% of days and abstinence on 55.8% of days. On the remaining (25.1%) days, participants did not provide a response to the meth use text (non-response). Daily adherence was modeled using logistic regression and average daily adherence across the study period was modeled continuously; these within-person and between-person effects were simultaneously estimated in the same multilevel model. **Results:** When examined concurrently, no association was seen between daily ART adherence and self-reports of meth use. Across individuals, having a higher proportion of non-responses, relative to “no” responses, to the meth use texts was associated with decreases in average daily adherence (B= -3.997, p= 0.002). Furthermore, those that responded with a greater proportion of “no” responses to the meth texts had marginally greater average daily adherence as compared to those that responded “yes” (B= 3.062, p= 0.050). When the daily link between categories of meth use responses and adherence was examined using a lagged model, the contrast between “no” responses to the meth use texts and a non-response showed that a “no” response on one day was associated with increased odds of adherence the next day (B= 0.303, OR= 1.354, p= 0.032), controlling for the previous day’s adherence. No

differences were found in this lagged daily relationship when meth use was endorsed “yes” as compared to a non-response. **Conclusion:** In the context of a text messaging intervention among HIV+ meth users, non-responsiveness to daily text messages about substance use may be prognostic of next-day ART adherence. These results may have implications for interventions targeting those at risk for ART non-adherence due to substance abuse, as a lack of engagement may be more predictive of adherence difficulties than endorsement of substance use.

Paper Session 6: Advancing Understanding of PREP Use and ART Adherence in the Context of HIV 11:00 AM-11:15 AM

FAMILY COMMUNICATION AND HIV DISCLOSURE PREDICTING ART ADHERENCE AMONG A VULNERABLE POPULATION LIVING WITH HIV/AIDS

Mary M. Mitchell, PhD[1], Tuo-Yen Tseng, MA[2], Amy Knowlton, MPH, ScD[2]

[1]Johns Hopkins University Bloomberg School of Public Health, Nottingham, MD; [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD

Background: Adherence to antiretrovial therapy (ART) is vital for reducing morbidity and mortality among people living with HIV/AIDS (PLHIV). Maintaining adequate ART adherence is especially important among disadvantaged, current or former drug using PLHIV. While individual characteristics have been studied in relationship to ART adherence, few studies have examined social network factors that influence adherence. We hypothesized that negative family communication and drug use at baseline would predict poorer adherence at 12-month follow-up, while family problem solving and HIV disclosure to network members would predict better adherence at follow-up.

Methods: We used data (n=313) from the BEACON study, which sampled primarily disadvantaged, inner city African Americans.

Results: Using factor analysis and structural equation modeling, we found support for our hypotheses such that negative family communication and current substance use predicted a lower likelihood of adherence at 12-month follow-up, while controlling for baseline adherence; and family problem solving and PLHIVs' greater disclosure of their HIV serostatus to their network members predicted an increased likelihood of adherence at follow-up.

Discussion: These results indicate the importance of family and social network factors in targeting and developing interventions to increase ART adherence among this disadvantaged population of PLHIV. ART adherence interventions that target social network members, especially family members, and promote family/network communication and problem solving may help to improve ART outcomes in this population.

BEYOND TEXT MESSAGE REMINDERS: TRANSLATING BASIC NEUROSCIENCE INTO A NEW ADHERENCE INTERVENTION FOR YOUTH LIVING WITH HIV

Amy L. Pennar, PhD[1], Sylvie Naar, PhD[2], Angulique Y. Outlaw, PhD[2], Steven Woods, Psy.D.[3], Thomas Templin, PhD[2], Karen MacDonell, PhD[2]

[1]Wayne State University School of Medicine, Detroit, MI; [2]Wayne State University, Detroit, MI; [3]University of Houston, Houston, TX

Despite inadequate medication adherence among youth living with HIV (YLH), and the importance of adherence for virologic suppression and reductions in morbidity and mortality, few interventions have been tested with youth. The purpose of this study was to test the proof-of-concept of a text-delivered prospective memory (PM) intervention for taking ART among YLH with suboptimal adherence. PM, the neurocognitive capacity to successfully form, maintain, and execute an intention at a particular point in the future, can be used to target basic neurocognitive processes involved in remembering to take medications.

Twenty-four, primarily male (87.5%), youth participated and were a mean age of 21.38 years (SD = 2.32). Participants were prescribed a median of 3 ART medications. Baseline mean CD4-1 was 552.83 cells/mm^3 (SD = 286.06) and log10 transformed viral load was 2.49 (SD = .81). Baseline measurements included a brief neuropsychological assessment, weekly phone-based pill counts, and the Visual Analogue Scale (VAS). The intervention included a one-time in-home session utilizing motivational interviewing and visualization to form implementation intentions that paired taking medication with a salient cue in participants' daily routines. The intervention session was followed by a 12-week tapering text-based reminder of the cue-intention pairing. Bi-weekly pill-counts and the VAS continued through the intervention and follow-up periods. Viral load and hair sample assays were obtained at baseline, 18 and 24 weeks.

From baseline to 18-weeks, 46.7% of youth evidenced a log drop ≥1 in viral load (0.5 drop considered clinically significant). By 24-weeks, 73.3% of youth evidenced a log drop ≥1. Data from the hair assays, pill counts and VAS were inconclusive. Rates of metabolizing medications and ceiling effects in reports of adherence may account for these findings, respectively. Qualitative analysis of exit-interviews supported the feasibility and acceptability of the

intervention via self-reports of acceptance of frequency of text messaging, feeling supported through their involvement, and enhancement of their ability to develop a medication routine and utilize visual cues to remember to take medications.

Targeting PM via brief interventions holds promise to improve health outcomes among YLH and reduce transmission via viral load suppression. Findings suggest the intervention is worthy of a controlled pilot trial as the next step while finding alternative adherence measures.

CORRELATES OF WILLINGNESS TO USE PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG HIGH-RISK DRUG USERS IN TREATMENT

Roman Shrestha, MPH[1], Frederick Altice, PhD[2], Pramila Karki, RN[3], Michael Copenhaver, PhD[3]

[1]University of Connecticut Health Center, Willimantic, CT; [2]Yale University, New Haven, CT; [3]University of Connecticut, Storrs, CT

Introduction: Although people who use drugs (PWUDs) are one of the key risk populations who could benefit from the use of pre-exposure prophylaxis (PrEP), to date, very little if any attention has been given to incorporating PrEP into HIV prevention approaches targeting this underserved group. This study aimed to fill a conspicuous gap in literature surrounding the knowledge base and acceptability of PrEP use among high-risk PWUDs in a common treatment setting.

Methods: A cross-sectional study was conducted among 400 HIV-negative individuals who reported drug- and/or sex-related risk behaviors and were enrolled in methadone maintenance program in New Haven, CT. Univariate and multivariate logistic regression analyses were used to assess self-reported demographic and behavioral correlates of willingness to use PrEP and the likelihood of drug- and sex-related risk reduction while on PrEP among high-risk PWUDs in treatment.

Results: Of the total participants, only 18% reported to have heard of PrEP and 62.7% reported that they would be willing to use PrEP. Willingness to use PrEP was independently associated with neurocognitive impairment status (aOR = 2.143, $p = .013$), and higher perceived risk for HIV infection (aOR = 3.811, $p < .0001$). Among participants who were willing to use PrEP, only 12.5% and 28.2% indicated they would always use condom and not share needles or works while on PrEP, respectively. The likelihood of consistent condom use was associated with higher income (aOR = 5.743, $p = .041$) and always using condoms with casual partners (aOR = 6.597, $p = .001$) and not sharing or needles or works was associated with age (aOR = .952, $p = .043$) and high perceived risk for HIV infection (aOR = .191, $p = .019$).

Conclusions: The results show that the majority of participants were unware of PrEP; however, after being informed about the basics of the medication, the majority indicated that they would be willing to take PrEP as part of HIV prevention. Our findings suggest that, because the use of PrEP has the potential to lead to risk compensation, the next generation of interventionists must carefully incorporate intervention content that simultaneously focuses on both HIV risk reduction and PrEP adherence over time.

Paper Session 7: Health Behaviors and Psychological States in Cardiac Rehabilitation 10:45 AM-11:00 AM

INTERGENERATIONAL EFFECTS IN CARDIAC REHABILITATION PATIENTS

Stephanie Leung, Ph.D.[1], Joseph Zander, Ph.D.[2], Lawrence C. Perlmuter, Ph.D.[3]

[1]VA Connecticut Healthcare System, New Haven, CT; [2]Advocate Medical Group, Park Ridge, IL; [3]Rosalind Franklin University of Medicine and Science, North Chicago, IL

Intergenerational transmission of illness behaviors from parents to children and health outcomes have been explored in individuals with chronic medical conditions such as cardiovascular disease. Research has demonstrated a relationship between maladaptive illness behaviors—i.e., preoccupation with illness or denial of disease—and poor cardiovascular outcomes, such as increased severity ofcardiac disease. Illness behaviors may be transmitted from parents to offspring via behavior modeling. Parental modeling of illness behavior has also been found to impact healthcare utilization (e.g., frequency of outpatient physician visits). In this study, intergenerational transmission of illness behavior was evaluated in a sample of outpatient cardiac rehabilitation patients. Adult participants' illness behavior was hypothesized to mediate the relationship between perceived parental illness behavior and participants' cardiac disease severity. Additionally, participants' illness behavior was hypothesized to mediate the relationship between perceived parental illness behavior and participants' healthcare utilization. The primary outcome variables were cardiac disease severity, measured by left ventricular ejection fraction, and healthcare utilization, which was assessed by number of outpatient physician visits and number of emergency room visits. Cardiac rehabilitation patients (n=111; 81 males, 30 females) completed measures regarding their illness behaviors and recollection of their parents' illness behaviors. Mediation analyses yielded significant relationships between perceived parental illness behavior and participants' illness behavior: recollection of perceived maternal illness behavior was significantly associated with participants' illness behavior (coefficient=.33, SE=.07, $p < .001$), and recollection of perceived paternal illness behavior significantly predicted participants' illness behavior (coefficient=.40, SE=.08, $p < .001$). No evidence was found for indirect effects or direct effects on outcome variables. When maternal illness behavior served as the predictor, participant illness behavior was significantly associated with higher frequency of ER visits (coefficient=.18, SE=.09, p=.05), suggesting that mothers' behavior may play a role in predicting ER presentations. These results implicate the role of parental modeling in illness behavior and warrant further research on intergenerational relationships in cardiac-related outcomes and healthcare utilization.

A QUALITATIVE STUDY OF VALUES AND MOTIVATIONAL FACTORS IN CARDIAC AND PULMONARY REHABILITATION PATIENTS

Jordan Ellis, MA, Matthew C. Whited, PhD, Licensed Psychologist, John T. Freeman, B.A., Ansley Taylor Corson, M.A.

East Carolina University, Greenville, NC

Participation in cardiovascular and pulmonary rehabilitation programs (CVPR) can lead to improved functional abilities, improved quality of life, and reduction of lifestyle related risks for those who have chronic cardiac or pulmonary conditions. Unfortunately, attendance and adherence to these programs remain suboptimal. Third wave behavioral therapies, including Behavioral Activation Treatment for Depression and Acceptance and Commitment Therapy, have emphasized the importance of life value identification as a guide for goal setting and behavior change for both psychological and physical health conditions. Individuals who choose to engage in behaviors that align with their life values are thought to be intrinsically reinforced. Thus, value identification and clarification could serve as a simple and individualized intervention strategy for CVPR patients to establish reason and meaning for engaging in lifestyle behavior change, which could improve attendance and adherence outcomes. The purpose of the following qualitative study was to interview CVPR patients about their own life values and motivating factors related to healthy behavior changes.

Thirty cardiac or pulmonary patients were recruited from a CVPR program in the Southeastern US, participated in a 20 to 30-minute interview, and completed a 10-item values engagement measure. Qualitative interview questions elicited conversation about values and motivating factors that guide the patient's engagement in the lifestyle change behaviors (e.g., exercise and dietary change) monitored by the CVPR program. The interviews were audio recorded and transcribed, and then coded thematically by the research team in NVivo.

Results showed that participants identified a wide range of values (17 in total) related to program engagement. It was predicted that most participants would directly identify their health improvement/maintenance as a value, given that this is the focus of goal setting at CVPR; however, only half of the patients did so. The most frequently endorsed life values (N= 17 total values) included, being active (70.0%), family (63.3%), and independence (56.7%). The interviews indicated that while patients make lifestyle changes in the program to improve their physical functioning, there are often other values that primarily guide their choice to engage in, and maintain, lifestyle behaviors. Results also indicated that approximately half of the patients had experienced a value shift, such that the most prominent values driving lifestyle behavior change shifted to values more directly associated with the things they enjoy in life (e.g. being active with family members).

Life values can serve as a powerful guide for individual behavior change, and the present study suggests that the piloting of brief values interventions early in CVPR treatment is warranted, and have the potential to improve patient outcomes.

COPING, OPTIMISM, AND PHYSIOLOGICAL OUTCOMES IN CARDIAC REHABILITATION

Victoria Bangieva, PhD[1], Lawrence C. Perlmuter, Ph.D.[2], Joseph Zander, Ph.D.[3]

[1]Stanford University School of Medicine, San Francisco, CA; [2]Rosalind Franklin University of Medicine and Science, North Chicago, IL; [3]Advocate Medical Group, Park Ridge, IL

Coping, Optimism, and Health-Related Outcomes in Cardiac Rehabilitation

Among Cardiac Rehabilitation (Rehab) patients the relationships between psychosocial factors and disease onset and progression are varied and complex. Coping strategies and optimism are among the psychosocial variables of interest in this population. The present study sought to assess relationships among four coping strategies (Distraction, Instrumental, Palliative, and Emotion-focused) in relation to physiological outcomes (metabolic equivalent task (MET), blood pressure, and BMI) in Cardiac Rehab patients. Additionally, the impact of optimism in these relationships was explored through moderation analyses. Physiological outcome data from 120 Cardiac Rehab patients was gathered at the start and completion of the 90-day program. Participants also completed psychosocial questionnaires on coping strategies, optimism, and depression at the start of the program. Results showed that Palliative coping has a deleterious effect on METs in Cardiac Rehab patients ($\beta = -.21$, $t(117) = -2.07$, $p = .04$), while Instrumental coping is associated with improvements in METs ($\beta = .21$, $t(117) = 2.35$, $p = .02$). Thus, Palliative and Instrumental coping have a distinctly different impact on health-related outcomes in Cardiac Rehab patients; passive behaviors are damaging to Cardiac Rehab patients while problem-focused behaviors are associated with better outcomes. Also, Emotional Preoccupation coping was predictive of the change in BMI ($\beta = .27$, $t(117) = 2.63$, $p = .01$), which suggests that participants who reported more emotion-focused coping behaviors gained weight during enrollment in Cardiac Rehab. Further, optimism was especially important in the relationship between Palliative coping and weight-related outcomes, where as optimism increased the relationship between Palliative coping and weight gain was weakened ($b = -.00$, $t = -2.14$, $p < .05$). Therefore, low optimism appears to be a risk factor for individuals engaging in passive coping behaviors. Consequently, this study has implications for cardiac patient care in the assessment and treatment of cardiovascular disease patients.

Paper Session 7: Health Behaviors and Psychological States in Cardiac Rehabilitation 11:30 AM-11:45 AM

THE EFFECTS OF VARYING LEVELS OF OPTIMISM ON PHYSICAL ACTIVITY AMONG CARDIAC PATIENTS

Rachel A. Millstein, PhD, MHS, Christopher Celano, MD, Eleanor Beale, BA, Jeff Huffman, MD

Massachusetts General Hospital, Boston, MA

Background: Over 1 million Americans suffer an acute coronary syndrome (ACS: myocardial infarction or unstable angina) each year. Positive psychological constructs may improve cardiac-related outcomes. Optimism has been associated with adherence to health behaviors, like physical activity, that can lead to improved functioning and cardiac health. We sought to examine the role of different levels of optimism on physical activity. Methods: Data from 156 patients was collected at 2 weeks and 6 months following hospitalization for an ACS as part of an observational study. We measured optimism using the 6-item Life Orientation Test-Revised (LOT-R) and divided the scores into quartiles. Objectively measured physical activity (average steps per day) was collected using the Fitlinxx Pebble uniaxial accelerometer. ANOVA with post-hoc tests and t-tests were used to explore univariate associations between levels of baseline optimism and physical activity 6 months post-ACS. A preliminary Latent Profile Analysis (LPA) was run to determine unique groups of patients with respect to their optimism scores. Results: LOT-R scores were not normally distributed and ranged from 7-30 (mean=23.72, SD=5.61). Quartiles were created: Q1 (scores 7-19), Q2 (scores 20-24), Q3 (scores 25-27), Q4 (scores 28-30). Participants in the highest quartile of optimism scores had the highest mean steps per day, and those in the second quartile had the lowest mean steps per day (Q1: 5190.56 steps/day, Q2: 4240.79, Q3: 4806.27, Q4: 5987.13). Omnibus ANOVA showed that LOT-R quartiles were significantly associated with steps (F (148)=2.78, *p*=.043). Post-hoc tests showed that Q4 mean steps were significantly higher than Q2 (Bonferroni comparison *p*=.039). Q4 mean steps were also significantly higher than Qs1-3 combined (t (150)=-2.51, *p*=.013). Initial LPA results suggest that there are three distinct latent classes of optimism scores. Conclusions: Cardiac patients with the highest optimism scores at 2-weeks post-ACS were most physically active 6 months later, compared to all other quartiles. These findings support prior literature indicating the importance of optimism for cardiac health and preventive behaviors. These findings suggest that interventions to promote optimism may have promise for helping cardiac patients improve physical activity after hospitalization. Next steps will include using LPA results to further define optimism profiles and understand their relationships with physical activity.

HEALS: A FAITH-BASED HYPERTENSION CONTROL PROGRAM FOR AFRICAN AMERICAN COMMUNITIES: RESULTS, CHALLENGES AND LESSONS LEARNED

Sunita Dodani, MD, MSc, PhD[1], Claudia Sealey-Potts, PhD[2], Sahel Arora, MD[3]

[1]Mayo Clinic, Jacksonville, FL; [2]University of North Florida, Jacksonville, FL; [3]University of Florida, Jacksonville, FL

Background. Health disparities related to cardiovascular diseases have remained higher in African Americans (AAs) than many other populations. In this study,we examined the feasibility and efficacy of a multi-level, faith-based hypertension control and prevention program, Healthy Eating And Living Spiritually (HEALS).

Design. In a pre-post single arm study design with a community based participatory research (CBPR) approach, we developed and implemented HEALS in a low-income urban AA church. Study participants were high-risk adult AA church members with known or newly diagnosed hypertension or pre-hypertension. The HEALS intervention included 3 months of weekly sessions (1 session per week for 12 weeks) followed by a 6 month maintenance period that included monthly booster sessions. The program was delivered by trained lay church members and had group, individual, and church level components. Fruits & Vegetables were also provided for the first 5 months of the program. Data were analyzed using repeated measures ANOVA at baseline, 3 months, 9 months, and monthly follow up blood pressure readings were also recorded. The primary outcome of interest was change in systolic blood pressure (SBP).

Results. Of the 52 church participants screened, 51 met the eligibility criteria and 37 provided written informed consent (n=37). A retention rate of 92% (34/37) and 73% (28/37) was observed at 3 and 9 months post-baseline, respectively. A SBP reduction of 12.6 mm Hg (p=0.0194) was observed at 3 months and 1.7 mm Hg (p=0.9998) at 9 months. The SBP reduction was greatest at 5 months (13.2 mm Hg from baseline; p=0.04)

Conclusion and Implications. Our study presents a feasible and efficacious model of a PREMIER /DASH modified CBPR program for hypertension control and prevention in AA communities, a group disproportionally affected by health disparities. More research is needed to test this intervention experimentally and to barriers to sustaining the lowered SBP.

UNITED MOTHERS: DEVELOPING AN EFFECTIVE PRENATAL INTERVENTION

Paola Ilescas, Student[1], Raquel C. Good, MA (in progress)[2], Kimberly D'Anna-Hernandez, PhD[1]

[1]CSU San Marcos, San Marcos, CA; [2]California State University San Marcos, El Cajon, CA

Gestational diabetes mellitus (GDM) is a growing public health concern that has detrimental effects. Affected women have a higher risk of developing type 2 diabetes. Maternal obesity and a diet of high fat, correlated with GDM, increases the susceptibility of the offspring developing health complications, including diabetes and obesity, and mental health and behavioral disorders. There is a health disparity found among pregnant minority women of which Mexican-American seem to be most affected. Between 1990 to 2001, a 96% increase of GDM cases was observed among Mexican mothers, the most rapid growth of GDM in any ethnic group. It is imperative to serve this population with a culturally sensitive prenatal program that aims to reduce these health disparities in GDM.

We are engaging in community-engaged research with a local community clinic for a pilot prenatal program tailored to the needs of the community with the goal of reducing gestational weight gain. First, six qualitative was gathered with clinic providers and patients data to understand those needs. The three clinic staff focus groups included 3 health educators, 3 medical assistants and two providers. The patient focused groups included pregnant women who were at risk for obesity-related complications during birth. One woman had previously participated in a prenatal program, 3 women were English-speaking and 5 women were Spanish speakers. The average age was 30 years and average BMI was 34.4, obese by NIH standards. Focus groups were led by research assistants with questions related to experiences in the clinic and feedback for future prenatal programs. After analyzing the discussions, the themes were patient-provider interactions, negotiating cultural barriers and patient empowerment. For pregnant women, we discovered waiting times and continuity of care were the main barriers to receive adequate prenatal care. Others were lack of emotional support when diagnosed with GDM and lack of access to more information, control over own medical care and cultural competence. Clinic providers expressed concerns over the lack of motivation, participation, empowerment and networking among pregnant women. After discussion with clinic leadership, we are proposing a culturally-competent group medical visit prenatal program. This program will be adapted for GDM and focus on continuity of care, patient empowerment amongst providers and patients, and increasing perinatal knowledge related to GDM. It will also provide psychoeducation related to fetal brain development and the maternal-fetal programming hypothesis as it relates to GDM - a need discovered by the focus groups. This will be one of the first prenatal group visit models to incorporate GDM,

culture and psychoeducation of neuroscience early in life to decrease gestational weight gain and promote healthy perinatal outcomes in Mexican-American pregnant women to reduce health disparities.

ACCESS TO PSYCHOSOCIAL SERVICES AMONG LATINO CANCER PATIENTS: MENTAL HEALTH PROVIDERS' PERSPECTIVES

Emely Perez Ramirez, BA[1], Emely Perez Ramirez, B.A.[2], Rosario Costas-Muñiz, PhD[3], Olga Garduño-Ortega, B.A.[3], Xiomara Singh, MD[4], Javier González, MFA[4], Normarie Torres-Blasco, MS[5], Francesca Gany, MD, MS[6]

[1]University of Puerto Rico at Rio Piedras Campus, Penuelas, N/A, Puerto Rico; [2]University of Puerto Rico/Memorial Sloan Kettering Cancer Center, Penuelas, N/A, Puerto Rico; [3]Memorial Sloan Kettering Cancer Center, New York, NY; [4]Memorial Sloan-Kettering Cancer Center, New York, NY; [5]Ponce Health Science University, Yauco, N/A, Puerto Rico; [6]Immigrant Health and Cancer Disparities Center, Memorial Sloan Kettering Cancer Center, New York, NY

Title: Access to psychosocial services among Latino cancer patients: A Mental Health Provider's perspective

Background/Purpose:
Research suggests that multiple structural, organizational, and psychological factors negatively impact Latinos' access to psychosocial services utilization **(PSU)** (1-4). This study aimed to determine the most common barriers identified by Mental Health Providers **(MHP)** from the United States **(US),** Latin America **(LA)** and Puerto Rico **(PR)** for PSU among Latino cancer patients **(LCP)** and to provide recommendations to improve psychosocial services **(PS)** access for Latinos in the US, LA, and PR.

Methods:
MHPs were invited to complete an online survey about barriers to PSU among LCP. Descriptive and chi-squares were used to identify common barriers and compare barriers by location of practice.

Results:
A total of 64 MHP participated. The most common barriers reported, included lack of: availability of MHP who speak Spanish, knowledge about how PS can help them, knowledge about where to receive PS, availability of MHP who understand patient's culture and health insurance, and also the belief that PS are too expensive. In analysis by location of practice (US vs. LA) the lack of availability of MHP who speak Spanish and the inconvenience of counseling centers' location for cancer patients were significantly greater barriers in the US.

Conclusions:

In sum, the most common barriers are access to (e.g. lack of availability of providers with cultural sensitiveness and language skills) and education about PS (e.g. lack of knowledge about where to receive PS or how PS can help). Only linguistic and location barriers were more common in US than LA. The majority of the barriers were encountered across locations with similar proportions.

Implications:

These results support the need for more culturally and linguistically competent MHP to treat LCP in the US. Our findings demonstrate the importance of developing culturally and linguistically adapted PS for LCP. To promote the utilization and access to PS in Latinos patient activation and the integrated Behavioral Health Care model can be employed by MHP.

Psychosocial Services Utilization **(PSU)**
Mental Health Providers **(MHP)**
United States **(US)**
Latin America **(LA)**
Puerto Rico **(PR)**
Psychosocial Services **(PS)**
Latino Cancer Patients **(LCP)**

ASSOCIATION BETWEEN SEVERITY OF PRETREATMENT SYMPTOMS AND COMPLIANCE WITH RADIATION THERAPY IN HEAD AND NECK CANCER PATIENTS

Joseph C. Edwards, MD Candidate[1], John Schmidt, PhD; MS[2], Julie Bauman, MD, MPH[3], Dwight E. Heron, MD; FACRO; FACR[4], Robert L. Ferris, MD; PhD[5], Dana Bovbjerg, PhD[6]

[1]University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]Navy Medicine Professional Development Center Walter Reed National Military Medical Center, Bethesda, MD; [3]University of Arizona College of Medicine - Tucson, Department of Medicine, Tucson, AZ; [4]UPMC Shadyside; University of Pittsburgh School of Medicine, Pittsburgh, PA; [5]University of Pittsburgh Cancer Institute; University of Pittsburgh School of Medicine, Pittsburgh, PA; [6]University of Pittsburgh Cancer Institute, Pittsburgh, PA

Introduction: Radiation therapy (RT) is one of the primary modes of treatment for head and neck cancer (HNC). Nonadherence to RT treatment (received dose < total planned dose or > 1 week break in treatment) has been shown to be associated with inferior locoregional control and survival. Although previous studies have reported that higher pretreatment levels of several emotional and physical symptoms, and poorer quality of life, predict inferior survival in this patient population, little attention has been paid to possible effects on treatment adherence. The goal of this prospective pilot study was to explore differences in pretreatment symptoms between patients who were subsequently adherent or not adherent to RT, as a first critical test of our overarching hypothesis that such associations may mediate relationships between pretreatment patient-centered variables and survival rates.

Methods: HNC patients scheduled for RT were recruited, signed informed consent, and completed self-report measures prior to RT. Validated questionnaires assessed pre-RT variables previously reported to be related to inferior clinical outcomes including levels of pain, fatigue, sleep, anxiety, and depression, as well as demographic data and quality of life. Clinical data were collected via chart review, and RT adherence defined as above. Relationships between pre-RT variables and RT adherence were explored with Mann-Whitney U tests in a sample of 15 patients (3 women, mean age 57 yr).

Results: Four of the 15 participants (27%) were nonadherent to RT. There were no significant differences in demographic or tumor characteristics between the two groups. Significant differences ($p < 0.05$) were found in baseline levels of: fatigue, pain, appetite loss, insomnia, sensory problems, physical function, role function, cognitive function, and pain self-efficacy.

Discussion: Prior literature has shown associations between patients' pretreatment symptom levels and HNC outcomes including survival, but few studies have included RT adherence in their analyses. Of the 11 pre-RT variables previously reported to be associated with poor clinical outcomes, 9 were found in this study to be significantly associated with nonadherence to RT. Although our results are correlative in a small sample, they suggest the importance of future research to evaluate RT compliance as a mediating factor in studies of the relationships between pre-RT patient experience and clinical outcomes including regional control of HNC and survival.

FACTORS THAT INFLUENCE PROSTATE CANCER SCREENING IN HISPANIC MEN: A SYSTEMATIC REVIEW

Jacob Martinez, BSN, RN

University of Miami School of Nursing and Health Studies- The University of Texas at El Paso School of Nursing, El Paso, TX

In a time when the Hispanic population continues to grow and prostate cancer screening recommendations have changed, it becomes important to systematically review the available literature for factors that influence men to screen. This article employed the socioecological model (SEM) to identify factors that influence prostate screening in Hispanic men at the intrapersonal, interpersonal, and community/societal levels. Academic Search Premier, CINAHL Plus, PsycINFO, PubMed, MEDLINE, and Google Scholar were queried without a timeframe; 21 articles met inclusion criteria and were selected. At the intrapersonal-level low health literacy, machismo, and other past cancer screening experiences were identified to influence prostate cancer screening in Hispanic men. At the interpersonal level, both the patient-physician relationship and the involvement of immediate family influenced screening. Lastly, at the community/societal level the following were identified as factors that influence prostate cancer screening: (a) access to care, (b) lack of cultural competence & tailoring, and (c) providers not engaging clients in prostate cancer screening discussions. Cultural norms, such as machismo, and socio-economic depravation were factors that manifested through all levels of the SEM. The results from this review will help healthcare professionals tailor their message when advocating and communicating the importance of screening in this underserved population.

NURSES' READINESS TO ADVISE BREAST CANCER SURVIVORS WITH COGNITIVE PROBLEMS: A META-SYNTHESIS STUDY

Sook Jung Kang, PhD, FNP-C

Ewha Womans University, Seoul, N/A, Republic of Korea

Purpose: After the completion of chemotherapy, 16 to 50% of breast cancer survivors experience cognitive problems. Since this health problems hampers survivors' back-to-normal life, it needs to be intervened based on their needs. The purpose of this study was to synthesize the result of qualitative studies related to cognitive problems of breast cancer survivors by conducting meta-synthesis review.

Methods: Literature search was conducted from 2007 to 2016 published in nursing, education, preventive medicine, and psychology journals using MEDLINE, CINAHL, EMBASE, PsycINFO, and Pubmed databases. Inclusion criteria were: 1) research focusing on the aspects of cognitive dysfunction in breast cancer survivors among chemotherapy; 2) papers published by peer reviewed journals; 3) research involving qualitative or mixed-method methodologies. Meta-synthesis was guided by Sandelowski & Barroso (2007), which is comprised of meta-summary and meta-synthesis.

Result: From past 10 years of search, 125 publications were reviewed and 9 articles were finally selected. After the quality assessment using Critical Appraisal Skills Program (CASP), articles were reviewed and analyzed by two separate investigators. For the meta-summary, four themes were revealed: 1) experience of cognitive decline; 2) impact on life after finishing the treatments; 3) coping strategies used to overcome the difficulties; and 4) lack of care and education from health care providers. One additional theme was found by meta-synthesis, which is 'emotional struggle through cognitive decline'.

Conclusion: According to the review, breast cancer survivors with cognitive impairments are struggling with their daily life and they feel they need more care and education from nurses regarding this issue. Although there are some guidelines to be utilized when counseling survivors with cognitive decline, more detailed and patient-tailored educational resources need to be organized and disseminated so that health care providers including nurses can advise breast cancer survivors with cognitive problems.

PROFESSIONAL IDENTITY AND TRAINING NEEDS OF LAY PATIENT NAVIGATORS

mariana Lara, Associate in Psychology

San Diego State University, san ysidro, CA

PROFESSIONAL IDENTITY AND TRAINING NEEDS OF LAY PATIENT NAVIGATORS

Purpose: Lay patient navigators work with people to “navigate” the health care system and access appropriate social and financial services. The objective of this qualitative study was to describe lay health workers’ perceptions of their professional identity and suggestions for patient navigator training.

Methods: Using a standardized focus group guide, 8 focus groups were conducted with lay health workers in four U.S. states (n=51; 90% female; 75% 40 years or older). Participants were recruited through email and word of mouth. All focus groups were audio recorded, transcribed verbatim, and analyzed using content analysis.

Results: Two specific themes emerged from the focus groups related to lay health workers’, the perceptions of their professional identity and needs for training. Focus group participants expressed confusion regarding the qualifications one must possess to be a lay patient navigator. Most participants identified as being a health promoter rather than being a patient navigator. Lay health workers provided many suggestions regarding topics of training that should be included in a lay patient navigation curricula, including: 1) physical and mental health ; 2) community and organizational resources that can facilitate access to care; and 3) communication and people skills, especially in assessment and intervention.

Conclusions: Data from focus groups indicated that lay health workers may not identify as being a patient navigator, despite having qualification of a lay patient navigator. Focus groups also indicated that there is substantial need for training of lay patient navigators and that training is needed across a wide range of topics.

STRENGTH OF CLINICIAN RECOMMENDATION OF HPV VACCINATION AND VACCINE DELIVERY RATES

Lila J. Finney-Rutten, PhD, MPH[1], Jennifer L. St. Sauver, MPH/PhD[1], Timothy Beebe, PhD[2], Patrick M. Wilson, MPH[1], Debra J. Jacobson, MS[1], Chun Fan, MS[3], Carmen Radecki Breitkopf, PhD[1], Susan Vadaparampil, PhD MPH[4], Robert M. Jacobson, MD[1]

[1]Mayo Clinic, Rochester, MN; [2]University of MN, Minneapolis, MN; [3]MAYO CLINIC, ROCHESTER, MN; [4]Moffitt Cancer Center, Tampa, FL

PURPOSE: We tested the hypothesis that strength of clinician recommendation of the human papillomavirus (HPV) vaccination would be associated with rates of vaccine delivery at the practice-site level.

METHODS: We conducted a survey of primary care clinicians (n=280) in a 27-county geographic region from October 2015 through January 2016 to assess clinician behaviors regarding HPV vaccination. The overall response rate for the survey was 41.0%, with 52 clinical sites represented. Additionally, we used the clinical data linkage infrastructure of the Rochester Epidemiology Project to ascertain actual HPV vaccination rates among patients residing in the same 27-county geographic region at the site level. We examined associations of clinician survey data on strength of recommendation for HPV vaccination for male and female patients aged 9 to 18 years with rates of initiation (1 dose) and completion (3 doses – the recommendation during our study period) among patients age 9 to 18 years (n=68,272) at the clinical site level.

RESULTS: Among clinicians who completed the survey, 71.1% indicated that they strongly recommend the HPV vaccine to their female patients while 58.2% strongly recommend to their male patients. The percentage of clinicians who strongly recommend the HPV vaccine was significantly higher among those practicing in pediatrics and board certified in pediatrics compared to those practicing in and certified in other primary care settings. Results of Poisson regression models were consistent with our hypothesis. Strength of recommendation of the HPV vaccination was associated with higher rates of HPV vaccination initiation and completion. Higher rates of initiation [Incident Rate Ratio (IRR)=1.15; 95% CI (1.08-1.23)] and completion [IRR=1.12; CI (1.02, 1.23)] were associated with stronger recommendations for vaccination among females; similar associations were observed for initiation [IRR=1.29; CI (1.21,1.38)] and completion [IRR=1.19; 95% CI (1.09, 1.31)] among males. All models were

adjusted for the following site-level characteristics: percent white, percent female, percent ages 9-13, and percent with government insurance or self-pay.

CONCLUSIONS: Clinicians more frequently strongly recommended the HPV vaccine to their female patients than to their male patients. Strength of clinician recommendation of the HPV vaccine is associated with HPV vaccine delivery rates-initiation and completion. These data can guide efforts to improve HPV vaccine delivery in clinical settings.

ANTIDEPRESSANT USAGE AT TIME OF STROKE IS RELATED TO BETTER MENTAL FUNCTIONING

Teresa M. Damush, Ph.D.[1], Lincoln Flossy, MPH[2], Chandan K. Saha, PhD[3], James Slaven, MS[4], Laura Myers, Ph.D.[5], Jason Mackey, MD[6], Linda Williams, MD[7]

[1]Indiana University School of Medicine/Roudebush VAMC PRISM QUERI Center, Fishers, IN; [2]Roudebush VAMC, Indianapolis, IN; [3]Indiana University School of Medicine, Indianapolis, IN; [4]Indiana University School of Medicine, Dept of Biostatistics, Indianapolis, IN; [5]Roudebush VAMC/PRIS-M QUERI Center, Indianapolis, IN; [6]Indiana University School of Medicine, Dept of Neurology, Indianapolis, IN; [7]Roudebush VAMC/Indiana University School of Medicine, Indianapolis, IN

Objective: An acute stroke may serve as a major life event that disrupts health-related quality of life. Post stroke depressant is prevalent and related to poorer outcomes. We examined the potential buffering relationship of antidepressants at time of stroke on mental health functioning among patients discharged from two health care systems: Veterans Health Administration (VHA) and a Joint Commission Stroke Center.

Methods: We enrolled 258 participants into a randomized controlled trial to evaluate a stroke self-management program which targeted functional recovery and risk factor management. All participants completed written consent and a baseline assessment which included demographics, anxiety (GAD), depressive symptoms (PHQ9), antidepressant usage, stroke specific, health-related quality of life (SSQoL) and pain (BPI). We conducted multivariate analyses to evaluate the relationship of antidepressant usage with baseline mental functioning.

Results: We enrolled our sample, on average, within 81.5 days after hospital discharge for stroke/TIA. Our sample included 19% women with an average age of 61.7 (10.8) years. The average NIH stroke scale score was 3.0 indicating minor stroke and did not differ among those with and without antidepressants. Demographics were not significantly related to SSQoL in the multivariate models. Among our cohort, 201 (78%) reported baseline usage. Among those using antidepressants, a significantly less proportion (26.4%) reported moderate to severe depressive symptoms compared to those who reported no usage (53.7%) (p

Conclusions: Stroke survivors reporting antidepressant usage reported moderate to severe depression symptoms at half the rate of stroke survivors without antidepressant usage. Antidepressant usage at the time of a stroke event may buffer the development of poorer

mental health functioning. Post stroke depression is prevalent and associated with morbidity and mortality. Therefore, post stroke programs which target depression at the early onset of survivorship may enhance stroke specific, quality of life.

EFFECTS OF SLEEP, DIET, AND PHYSICAL ACTIVITY ON CARDIOVASCULAR DISEASE IN THE UNITED STATES: AN AGENT-BASED MODEL SIMULATION

Azizi Seixas, PhD, MS[1], Ferdinand Zizi, MBA[2], Girardin Jean-Louis, PhD[2]

[1]New York University School of Medicine, New York, NY; [2]NYU School of Medicine, NY, NY

INTRODUCTION: Cardiovascular disease (CVD) is the number one reason for health-related morbidity and mortality in the United States. To reduce the burden of CVD, several behavioral prevention strategies (eliminate smoking, healthy diet, and increased physical activity) have been implemented. Unfortunately, these efforts have only yielded modest improvements, and in some groups (racial/ethnic minorities) the burden of CVD is mounting. Recent evidence that sleep is associated with increased CVD risk, acknowledges sleep as a novel and potentially impactful target to reduce CVD burden. The current study explored the long-term impact reducing the prevalence of insufficient sleep can have on the burden of CVD (diabetes, stroke, and myocardial infarction) in the US, compared to healthy diet (eating fruits and vegetables) and moderate physical activity.

METHOD: Using a representative sample of 100,000 hypothetical participants who do not have sufficient sleep in an Agent-Based Model simulation (a dynamic simulation technique), we investigated how reducing the prevalence of insufficient sleep (≤6 hrs.) and improving the prevalence of average sleep duration (7-8 hrs.), health diet and physical activity by 10% and 20% impact the prevalence of CVD (including diabetes, myocardial infarction, and stroke) over a 10 year period. We also compared the relative effect sleep, healthy diet, and physical activity have on diabetes and CVD over a 10-year period.

RESULTS: Based on the simulation, reducing the prevalence of insufficient sleep by 10% and 20% could potentially reduce the prevalence of diabetes among insufficient sleepers by 1.7% and 2.6%, respectively, in 10 years. In comparison, improving healthy diet or physical activity by 10% and 20% activity had much less significant effect; the prevalence of diabetes was only reduced by less than 1% in all simulated scenarios related to improved diet and physical activity. In addition, reducing insufficient sleep could reduce the prevalence of stroke and myocardial infarction by 0.5% in 10 years.

CONCLUSION: Improving sleep could be more impactful in preventing or reducing prevalence of diabetes, myocardial infarction and stroke, compared to healthy diet and physical activity.

Future research should examine the impact of improving sleep in other population groups, especially those with high risks of diabetes, myocardial infarction, and stroke.

MOMMIO: A VIDEOGAME FOSTERING THE USE OF EFFECTIVE VEGETABLE PARENTING PRACTICES WITH PRESCHOOLERS

Sheryl Hughes, PhD[1], R Buday, FAIA[2], J Baranowski, MPH[1], Teresia O'Connor, MD, MPH[1], T Nicklas, Dr.P.H. [1], A Beltran, MS[1], H Dadabhoy, MS, RD[1], Tom Baranowski, PhD[1]

[1]Baylor College of Medicine, Houston, TX; [2]Archimage, Inc., Houston, TX

Vegetable consumption is related to better child diet quality; however, many parents report that their children dislike vegetables. Simulation is one way to produce a fun and engaging experience for parents to learn new skills to facilitate child vegetable consumption. The Mommio game was designed to produce such an experience, especially for mothers who oversee food parenting. Mommio was designed to be played on smartphones in short time frames (e.g. 5-10 min) when busy mothers have time to play. The three dimensional environment includes a home, back yard, automobile, and a grocery store. The player can choose specific characteristics for the child avatar (Kiddio) such as gender, hairstyle, and skin color. Artificial intelligence governs the child's behavior. The mother character is controlled by the player and can explore all aspects of the three dimensional food environment including kitchen cabinets, refrigerator, and recipe box. During gameplay, Kiddio becomes hungry and the player is required to search for vegetables in the home (or at the store) and prepare them for consumption. When Kiddio refuses to eat the vegetables, the player must select from a list of effective and ineffective parenting practices to deal with the child. Choosing more effective vegetable practices results in winning whereas choosing more ineffective practices results in losing. The player can also set a goal to use an effective practice later with their real world child. Episodes include a lunch, a dinner, riding in the car, shopping at the grocery store, and preparing a vegetable dish with the child. Extensive formative research was conducted to guide the design of the videogame. Tests of alternative forms of providing feedback on ineffective practice choices revealed that feedback should avoid vague warnings and provocation of guilt, use succinct but correct grammar, and clearly identify why the choice was problematic. Early alpha testing revealed mothers' desires for more extensive recipes in the recipe box. Tested recipes met their need for quick easy to prepare dishes that tasted good to their child and self. Two novellas, *Totally Frobisher* and *CHA*, provide backstory.

PARENTS' OPINIONS ABOUT USING THEIR CHILDREN'S EMR FOR RESEARCH: A CONTINUUM OF PERSPECTIVES ACROSS THREE GENETIC GROUPS

Melissa Raspa, PhD[1], Sara Andrews, MPH, RD[1], Anne Edwards, BA[1], Lauren Turner-Brown, PhD[2], Alexandra Alvarez, BA[2], Rebecca Moultrie, BA[1], Laura Wagner, MPH[1], Anne Wheeler, PhD[1]

[1]RTI International, RTP, NC; [2]UNC Chapel Hill, Chapel Hill, NC

Introduction: The advent of electronic medical records (EMR) has led to a tremendous shift in health care delivery and the ability to mine large amounts of clinical data. Simultaneously, advances in genomic science have led to increased understanding of rare diseases. These developments elicit the need to examine parents' preferences for using their children's EMR for research purposes. Specifically, there is a need to understand the perspectives of those with suspected or known genetic conditions; these groups may have the most to gain from research but also face increased risks.

Methods: Using a semi-structured guide, we conducted focus groups in the triangle area of North Carolina with parents of typically developing (TD) children with no known genetic conditions (n=8); parents of children with autism spectrum disorder (ASD), a suspected genetic condition (n=5); and parents of children with fragile X syndrome (FXS), a known genetic condition (n=6). The majority were mothers (74%). Participants were 63% White, 26% Black or African American, and 11% Asian; 5% identified as Hispanic. Approximately 74% were married and 53% reported family incomes of $75,000 or less. Focus groups were recorded, transcribed, and analyzed for thematic content.

Results: Almost all participants were in favor of sharing their children's EMR for research purposes, although there was a continuum of perspectives. Parents of TD children were the most conservative in their preferences. Parents of children with ASD were the most open to sharing, stating that research was the only way to better understand ASD. Parents of children with FXS were also supportive of EMR research for similar reasons, but had more caveats. Both known (FXS) and suspected (ASD) genetic groups were willing to share sensitive information about their children, such as genetic test results and mental health issues, which they considered part of their children's conditions. It was also important to these groups to receive research results. A main concern of all groups was the risk of personal information being accessed and misused for non-research purposes (e.g., identity theft, stigmatization, discrimination). All groups also had reservations about pharmaceutical companies using their

children’s EMR for research, with many worrying that data could be used for ulterior motives. The known and suspected genetic groups were more willing if the work was conducted in partnership with trusted researchers. Perceived benefits of sharing EMR data were altruistic in nature, with the two genetic groups also seeking personal benefit for their children.

Conclusions: Overall the genetic groups believed EMR research would offer more benefits than risks. Ensuring that parents have sufficient information to make an informed decision about their children’s participation was critical to all groups’ preferences.

EXAMINING THE RELATIONSHIP BETWEEN OMEGA-3 FATTY ACIDS AND ANXIETY: POSSIBLE MECHANISMS AT PLAY

Ashley R. Polokowski, M.A.[1], Haque Shakil, Student[2], Laura C. Reigada, Ph.D.[2]

[1]The Graduate Center, City University of New York, Brooklyn, NY; [2]Brooklyn College, City University of New York, Brooklyn, NY

Background: One of the most under-recognized factors in the development of mental health disorders is the role of nutrition. Omega-3 fatty acids (ω-3 FAs) possess numerous physical and mental health benefits and are a necessary component of a healthy lifestyle. Given the anti-inflammatory properties of ω-3 FAs, they are being tested as a potential treatment option for various physiological and psychological diseases characterized by high levels of inflammation. Much of the literature examining ω-3 FAs and mental health has targeted depression with growing support that ω-3 FA supplementation has therapeutic benefits in reducing depressive symptoms but has been studied much less within anxiety. The aim of the present systematic review is to assess the current understanding of the possible mechanisms underlying the relationship between ω-3 FAs and anxiety. **Methods:** 1,277 citations were identified as a result of the initial literature search, after the removal of duplicates (n=388) and irrelevant literature (n=712), the full-text of 177 studies were screened for eligibility criteria. Six studies met inclusion criteria for the systematic review. **Results:** The six studies were grouped into three sections determined by clustering of primary outcomes reported by each study (Physiological Correlates, Inflammatory Response, and Neuroendocrine Processes). Several mechanisms (e.g., IL-6, salivary cortisol) have been noted to potentially explain the association between ω-3 FAs and anxiety. No support was found for other variables (e.g., heart rate variability, IL-β) as possible mechanisms. **Future Implications:** This systematic review is the first to examine the potential mechanisms underlying the relationship between ω-3 FAs and anxiety. Findings showed a large amount of heterogeneity between studies and future work should implement more rigorous methodology (e.g., consistent dosage and duration of ω-3 FA supplements, assessment of dietary patterns). While it is not possible to make robust conclusions given the literature is in its early stages, initial empirical findings of this review provide a preliminary understanding of possible mechanisms by which ω-3 FAs influence anxiety. These findings indicate that future research should aim to directly test mechanisms of physiological correlates (e.g., cortisol) and the inflammatory response (e.g., IL-6) underlying this relationship. Elucidating these mechanisms can help improve the prevention and treatment of anxiety.

IMPACT OF A DECISION AID ON SEVERE COPD PATIENTS’ MOTIVATION TO ENGAGE IN ADVANCE CARE PLANNING

Melissa Basile, PhD[1], Johanna Andrews, MPH[1], Sonia Jacome, MSCH[1], Meng Zhang, PhD[1], Michael A. Diefenbach, Ph.D.[1], Negin Hajizadeh, MD, MPH[2]

[1]Northwell Health, Manhasset, NY; [2]Northwell. Health, Manhasset, NY

Purpose: To assess impact of the InformedTogether COPD decision aid on patient motivation to engage in advance care planning (ACP) i.e. wanting life support vs. comfort care for a severe breathing exacerbation.

Methods: Severe COPD patients were identified through our health system’s EHR and recruited at 7 outpatient clinics. Patients viewed the decision aid with their clinician, and were interviewed prior to, immediately after, and 1 month after viewing the decision aid. To assess motivation to make an ACP, patients were asked at each of these time-points about the likelihood that they would make an ACP within the next year, and were scored using a 5 point Likert scale. Clinical encounters using the decision aid, and 1 month follow up interviews were recorded and transcribed for qualitative analysis.

Results: N=38 patients were enrolled. Mean age: 66 ±10; majority education: 9th-12th grade; race: n=19 White/n=7 Black/n=11 Hispanic/n=1 other; mean health: good/fair; numeracy: n=19 high/n=19 low. At baseline, 17 people (45%) did not have an ACP or were not highly motivated to make one. Of those 17, by 1 month: 12 had increased motivation, 3 stayed the same, 2 had decreased motivation (4 had made, and 5 said they definitely would make, an ACP). Qualitative analysis showed that 9 people (53%) discussed ACP with their families as a result of using the decision aid; and the decision aid had helped them to focus on the process of ACP. At 1 month, one patient stated: “You know, throughout the years I’ve said, “I want this, I want this,” but after seeing the decision aid, I became serious and discussed exactly what I want.” Another stated: “You know, [since seeing the decision aid] it has been really weighing on my mind. Almost like, it’s just made me feel like, you gotta get things done.”

Conclusion: Our decision aid was intended to increase patient motivation to discuss end of life care preferences, but not necessarily require that a decision be made. For patients with advanced COPD, ACP facilitated by a decision aid may serve as one variable motivating an individual to prepare for end of life decision making. For many people, specific events trigger opportunities for deliberation and planning at different periods in time. Our decision aid

created one such opportunity for patients by allowing them to introduce a difficult topic with others involved in their care.

RISKY BEHAVIORS AND DIABETES OUTCOMES IN THE TRANSITION FROM ADOLESCENCE TO EMERGING ADULTHOOD WITH TYPE 1 DIABETES

Eunjin Lee, Ph.D.[1], Cynthia Berg, Ph.D.[1], Ashley C. Baker, B.S.[2], Daniel Mello, N/A[3], Bryce A. Huntbach, Psychology, BS (Expected Fall 2016) [1], Michelle Litchman, PhD, FNP-BC, FAANP[1], Deborah Wiebe, MPH, PhD[3]

[1]University of Utah, Salt Lake City, UT; [2]University of California Merced, Merced, CA; [3]University of California, Merced, Merced, CA

Adolescence and emerging adulthood are important developmental periods for establishing health-promoting behaviors, though youth are also vulnerable to risky behaviors (e.g., smoking, drinking alcohol, and unhealthy weight loss behaviors). Such risky behaviors are especially problematic for youth with type 1 diabetes, as they increase the risk for developing health complications in adulthood. This study explored the concurrent and longitudinal associations between risky behaviors (i.e., smoking, drinking, and skipping insulin to lose weight) and diabetes management (i.e. adherence and glycemic control). We examined these associations during the transition from late adolescence to emerging adulthood for individuals with type 1 diabetes who were in their last year of high school (*N* = 247, M age = 17.76) at Time 1 and one year later (Time 2). Adherence was measured by the *Diabetes Behavior*Rating Scale (DBRS) and glycemic control was assessed through HbA1c assay kits. As engaging in risky behaviors is related to higher externalizing behavior problems, all analyses controlled for oppositional behaviors (as assessed by Conner's Rating Scales) to isolate the effect of risky behaviors in addition to gender, race (white/non-white), pump status, and years since diagnosis. Furthermore, as smoking and drinking are highly associated with one another, analyses of these variables were examined simultaneously. Hierarchical regression analyses revealed that participants (time 1) who had smoked a cigarette in the past six months had poorer HbA1c levels. At time 2, participants who had smoked a cigarette in the past six months had lower adherence. From late adolescence to emerging adulthood, participants who had smoked a cigarette in the past six months at time 1 showed larger decreases in adherence (time 2, after controlling for adherence at time 1). Drinking did not account for significant variance in either HbA1c or adherence. Finally, at time 2, participants who skipped insulin to lose weight had poorer HbA1c. From late adolescence to emerging adulthood, those who skipped insulin to lose weight more at time 1 changed over time to have poorer HbA1c (time 2, while controlling` for time 1 HbA1c). The risk behaviors of smoking and skipping insulin appear to be especially detrimental for adherence and HbA1c in the transition from late adolescence to emerging adulthood both concurrently and longitudinally.

THE ONE DROP MOBILE APP AND EXPERTS PROGRAM IS EVIDENCE-BASED AND IMPROVES BLOOD GLUCOSE

Chandra Osborn, PhD, MPH[1], Mark Heyman, PhD, CDE[2], Jeff Dachis, MA[3]

[1]One Drop, Informed Data Systems Inc., Nashville, TN; [2]University of California, San Diego, Solana Beach, CA; [3]Informed Data Systems Inc., New York, NY

Overview: Mobile health apps must incorporate best practices for clear health communication, behavior change, psychosocial care and education. The One Drop iOS and Android app is used by over 120,000 people worldwide. The app facilitates blood glucose (BG) and self-care tracking, and provides recipes, insights, tips and community support ('likes', stickers, data sharing). In December 2016, One Drop released the 'Experts' coaching service. Certified Diabetes Educators deliver a structured in-app program and offer 'on call' support. Here, we describe One Drop's grounding in scientific evidence, incorporation of best care practices, and present its initial efficacy.

Mobile App: The app's self-care tracking feature is designed to enhance understanding (information) of the link between behaviors and BG. The combination of in-app recipes, inspirational content and community data sharing and praise is designed to enhance favorable attitudes and social normative support that, combined, fuel motivation. The medication and BG check reminders, data-driven insights, and health tips are designed to enhance self-efficacy or behavioral skills. In these and other ways, the One Drop app is grounded in the empirically-supported Information—Motivation—Behavioral Skills model of behavior change. Finally, all content is presented clearly, including numerical information.

Experts: 'Experts' uses best practices for clear health communication, omitting jargon, simplifying instructions and lessons, and using the teach-back technique to confirm understanding. 'Experts' teaches evidence-based behavioral techniques (e.g., setting realistic goals, using environmental cues to remember behaviors). It also provides emotional and instrumental support, and behavior change accountability. Finally, 'Experts' provides strategies to overcome psycho-social barriers to performing self-care.

Initial Efficacy: After one month, people tracking food and BG with the One Drop 'App + Experts':

6. Reduced their average BG by 15% (27 mg/dL)
7. Lowered their average BG from 185 mg/dL (A1c 8.1%) to 158 mg/dL (A1c 7.1%)

8. Reduced their percentage of high BG readings from 18.5% to 3.7%
9. Achieved 40% more in-range BG readings

Conclusions: One Drop incorporates critical programmatic elements associated with self-care and A1c in the scientific literature. At one month, the One Drop ‘App + Experts’ significantly improved BG. Evidence-based and effective mobile health programs may serve an important public health role in providing self-care support in a scalable manner.

BODY MASS INDEX OF COLLEGE STUDENTS EXHIBITING AVOIDANT/RESTRICTIVE FOOD INTAKE DISORDER AND PICKY EATING BEHAVIOR

Jordan Ellis, MA[1], Hana F. Zickgraf, MA[2], Matthew C. Whited, PhD, Licensed Psychologist[1], Amy T. Galloway, Ph.D.[3]

[1]East Carolina University, Greenville, NC; [2]University of Pennsylvania, Philadelphia, PA; [3]Appalachian State University, Boone, NC

Avoidant/Restrictive Food Intake Disorder (ARFID) is a new DSM-5 diagnosis designed to capture patients with clinically significant restrictive eating problems that result in persistent failure to meet nutritional/energy need or cause psychosocial difficulties. Picky eating (PE) behaviors are one manifestation of ARFID. PE is characterized by the consumption of a limited variety of food, through the avoidance or rejection of familiar and unfamiliar foods. PE research has largely focused on children but PE can persist in to adulthood, and develop into adult ARFID. It is not known if picky eating among adults results in failure to meet energy need as it can in children.

The current study examined relationships between Body Mass Index (BMI), ARFID, and adult PE, to explore differences between PE and traditional ED symptoms in regards to BMI. Previous research has shown clear relationships between BMI and traditional EDs, but research on BMI and PE has been mixed. Some studies have indicated that childhood picky eaters are more likely to be underweight, but these relationships remain unclear in adults and are important given BMI’s status as a health indicator.

Participants in a college sample (*n* = 1219; 4.1% underweight, 63.2% normal weight, 21.0% overweight; 11.8% obese) completed the Nine Item ARFID Screener (NIAS), Adult Picky Eating Questionnaire (APEQ), Eating Disorders Diagnostic Scale (EDDS), and ARFID Symptom Checklist (ARFID-cl). The ARFID-cl is used to confirm an ARFID diagnosis based on DSM-5 criteria and was used to classify a probable ARFID diagnostic group (*n* = 31), subclinical ARFID group (*n* = 86), group who screened for some picky eating behaviors (*n* = 799), and typical eating group (*n* = 272).

Pearson correlations indicated no significant associations between BMI and the NIAS (r = -.01, p = .84), or APEQ (r = .05, p = .10). A bootstrapped ANCOVA, with the EDDS composite score as a covariate, showed BMI did not differ across ARFID groups, F(3, 1202) = .70, p = .55. ARFID groups were also compared across BMI groups (i.e. underweight, normal weight, and

overweight/obese), and revealed no significant differences by group (X^2 (6) = 1.76, p = .94) As expected, the EDDS was positively correlated with BMI (r = .29, p < .001), and ED risk groups were associated with BMI in the expected directions.

In the current sample, BMI was not associated with ARFID group, indicating that adult PE behaviors do not appear to contribute to failure to meet energy need.

PREGNANT WOMEN’S KNOWLEDGE OF GESTATIONAL WEIGHT GAIN: ONLINE NEEDS ASSESSMENT

Shannon Mellon, Student Researcher[1], Alicia A. Dahl, MS[2], Brie Turner-McGrievy, PhD, MS, RD[3]

[1]University of South Carolina: Arnold School of Public Health, Bristol, CT; [2]University of South Carolina, West Columbia, SC; [3]University of South Carolina, Columbia, SC

BACKGROUND: The Institute of Medicine (IOM) recommends a range for healthy gestational weight gain (GWG) based on pre-pregnancy Body Mass Index (BMI). Health practitioners are the primary source of health information during prenatal appointments. Mobile applications (apps) and websites hold potential as convenient and available resource for pregnant women. Electronic health (e-health) interventions could be used as a parallel or supplemental tool to provide pregnancy weight-related information, specifically IOM recommendations for GWG. Understanding pregnant women’s knowledge and perceptions regarding GWG is essential for the development of meaningful resources.
METHODS: Using Facebook and Twitter social media sites, pregnant women living in the United States who owned a smartphone were recruited to complete a brief one-time online survey regarding the needs and interests of pregnant women to guide the development of an e-health intervention. The survey included questions regarding pregnancy history, weight-related knowledge and behaviors, topics discussed with health care practitioners, information sought by pregnant women, and interests in electronically delivered health information. Descriptive statistics, chi-square, and regression analyses were used to summarize the data.
RESULTS: A total of 324 pregnant women completed the survey and self-reported pre-pregnancy height and weight (mean BMI =26.1±6.5). Majority of the sample was normal weight (53.1%). Half of the participants (50.6%) reported that they did not receive recommendations for healthy GWG from their physicians during pregnancy. Provider recommendations were not associated with pre-pregnancy BMI classification (X^2=0.189, *p*=0.979). When asked about how much weight would be healthy to gain during pregnancy, 46 participants (14.5%) cited GWG below recommendations for their BMI class, 200 (62.9%) cited within recommendations and 72 (22.6%) cited above recommendations. Normal weight women most often cited GWG within IOM recommendations (N=114, 35.8%), while overweight/obese women most often cited GWG above recommendations (N=50, 41%).
CONCLUSIONS: Normal weight participants frequently responded with a GWG recommendation within IOM guidelines, while overweight/obese participants responded with a GWG that exceeded IOM guidelines. This indicates that more targeted resources and efforts

are needed to increase overweight/obese pregnant women's knowledge of healthy GWG. Physician-provided information to address IOM guidelines may help close that gap in knowledge, but mobile apps or websites geared towards pregnancy can address GWG recommendations as well.

THE EFFECTIVENESS OF INTERVENTIONS TO SUPPORT HEALTHIER FOODS AND BEVERAGES IN SCHOOLS: NEW FINDINGS FROM THE COMMUNITY GUIDE

Holly Wethington, PhD[1], Ramona Finnie, DrPH, MPH, CHES[1], Devon Okasako-Schmucker, MPH[1], Leigh Buchanan, PhD[2], Shawna Mercer, PhD, MSc[1]

[1]Centers for Disease Control and Prevention, Atlanta, GA; [2]Cherokee Nation Assurance, Atlanta, GA

Purpose: Schools can play an important role in promoting healthier dietary habits and preventing obesity because most US children attend school six hours a day and consume as much as half of their daily calories at school. This systematic review evaluated the evidence on effectiveness of interventions to support healthier foods and beverages in schools.

Methods: This review included the subset of studies from the Agency for Healthcare Research and Quality's *Childhood Obesity Prevention Programs: Comparative Effectiveness Review and Meta-Analysis* that focused on dietary-only approaches in schools, combined with an electronic database search through February 2016. Using the CDC Comprehensive Framework for Addressing the School Nutrition Environment and Services, studies were stratified into four intervention types: 1) Meal and fruit and vegetable snack interventions to increase the availability of healthier foods and beverages provided by schools (MFVS), 2) Interventions supporting healthier snack foods and beverages sold or offered as a reward in schools (SFB), 3) Multicomponent interventions to increase availability of healthier foods and beverages in schools (multicomponent), and 4) Interventions to increase water access in schools (WA). Community Guide systematic review methods were used to identify studies and judge quality of execution. Evidence was evaluated using measures of dietary habits and weight outcomes including, but not limited to, fruit/vegetable consumption and obesity prevalence. When possible, relative percent change, medians and interquartile intervals (IQI) were calculated for each outcome.

Results: Thirty-five studies were included. Highlights of dietary and weight-related outcomes include that MFBS interventions were effective in increasing fruit/vegetable consumption (5 studies/6 arms; relative percent increase of 25.7%, IQI: 0.25%-55.2%) and multicomponent interventions were effective for stopping the increase in overweight/obesity prevalence (6

studies, favorable findings for 4). Evidence was insufficient for SFB and WA, due to too few studies.

Conclusions: Interventions to support healthier foods and beverages in schools show improvements in several dietary and weight-related outcomes for MFBS and multicomponent interventions. More research is needed for SFB and WA, and behavioral researchers are encouraged to develop consistent measures of diet and weight outcomes to allow for synthesizing and strengthening the evidence base.

DO SOCIOECONOMICALLY DISADVANTAGED POPULATIONS USE TECHNOLOGY?

Michele G. Lanpher, MA[1], Jacob Christy, BS[2], Sandy Askew, MPH[3], Gary G. Bennett, PhD[3]

[1]Psychology and Neuroscience, Duke University, Durham, NC; [2]Duke Global Digital Health Science Center, Duke University, Durham, NC; [3]Duke University, Durham, NC

Background: Socioeconomically disadvantaged and racial/ethnic minority populations experience disproportionately high rates of obesity and have the least access to medical care. Obesity treatment delivered via mobile technologies may be a viable option for this population. We sought to examine trends in technology use among a medically vulnerable population enrolled in a behavioral weight loss program.

Methods: Participants (N=351) were enrolled in Track, a 12-month randomized controlled weight loss trial in primary care. The obesity treatment intervention included weekly self-monitoring via interactive voice response and text messages, 18 coaching calls with dietitians, e-scales for daily self-weighing, and skills training. Using baseline data, we analyzed the proportion of Track participants that used technology and whether use varied by sociodemographic variables or was associated with engagement in the intervention (i.e., percentage of coaching calls and self-monitoring interactions (IVR or text) completed).

Results: Over half (54%) of participants were Black, only 10% received a college degree and 30% were living below the U.S. poverty threshold. All participants were required to own a text-enabled cell phone, but 9% of individuals reported no SMS use. Over half (53%) owned a smartphone, 57% had social media (Twitter or Facebook), 75% owned computers (laptop or desktop), and 85% used Internet or email, while 86% reported using at least one of these technologies. Individuals with greater education were more likely to use smartphones, social media, computers and Internet/email (all ps < .01). Those at or above the poverty threshold were more likely to use the Internet/email (90% vs. 81%) and computers (83% vs. 67%; all ps < .01). Individuals who were younger were more likely to use all forms of technology (all ps < .001), as were those with higher health literacy (all ps < .01). Blacks were less likely to have social media, compared to non-Blacks (51% vs. 64%; p < .05). There was no difference in technology use by gender or BMI. Among intervention participants, there was no association between technology use and either of the engagement variables.

Conclusion: As obesity is highly prevalent in medically vulnerable populations, innovative strategies are needed that are both accessible and engaging. Digital health solutions may be an appropriate treatment option. Track's population displayed high uptake of technologies;

these rates are comparable to those found among U.S. adults. Surprisingly, engagement in the intervention did not vary by any of the technology use variables, suggesting that limited technology use did not impede an individual’s engagement with the intervention. Obesity interventions targeting socioeconomically disadvantaged populations should consider using mobile technologies for treatment delivery.

EXPLORING ETHNIC/RACIAL DIVERSITY IN RECRUITMENT AND RETENTION IN A MOBILE HEALTH INTERVENTION TARGETING OBESITY

Kinnari (Nina) Jhaveri, BA, MBA[1], Samantha Schleicher, BA[2], Michael A. Cohn, PhD[3], Ashley E. Mason, PhD[2]

[1]University of Southern California, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA; [3]Uber Technologies, San Francisco, CA

Background: Although the mobile delivery of health behavior interventions may address treatment barriers, such as inabilities to physically present to a clinic due to cost, childcare, or work, the extent to which mobile interventions are sought after and utilized across individuals of differing ethnic background remains unknown. Here, we sought to explore ethnic/racial differences in recruitment, enrollment, and completion of a 28-day (28-lesson) smartphone-delivered mindful eating intervention targeting reductions in craving-related eating.

Methods: Participants (n=104) learned of the study via social media (e.g., Facebook, Craigslist) and UCSF communications (e.g., university-wide email, paper patient letters). Participants completed in-person visits and text-based assessments before, and one month after competing, the 28-day smartphone-delivered mindful eating intervention. We used Monte Carlo estimates of exact tests to examine whether the following differed significantly by race/ethnicity: 1) initial eligibility, defined as BMI≥25, age≥18 yrs, female, smartphone-owning, locale status, no diabetes, no history of eating disorders, and intractable food cravings most days of the week; 2) enrollment status, defined as enrolling or not; and 3) intervention completion per protocol [≤90 days] or at all [≤150 days]. We used one-way ANOVAs to examine whether race/ethnicity was associated with 4) number of lessons completed, and 5) number of days to complete all 28 lessons.

Results: Of 1651 participants who completed an online screener, 719 met initial eligibility criteria, and 104 completed a baseline visit and began the intervention. Of these 104 participants (M BMI=31.2; M Age=46.1), 71 (68.3%) identified as White, 11 (10.6%) as Hispanic/Latino, 10 (9.6%) Asian/Pacific Islander, 5 (4.8%) as Black, 6 (5.8%) as Mixed Race/Other, and 0 (0 %) as Native American/Native Alaskan. Participants completed an average of 22.9 days (lessons). The following variables did not significantly differ by race/ethnicity: Initial eligibility (p=.124); enrollment status (p=.675); intervention completion per protocol (≤90 days; n=64; p=.412), or at all (≤150 days; n=77; p=.368); number of lessons completed (F=1.46, p=.222); and days to complete intervention (F=0.26, p=.905).

Conclusions: Diverse populations seek out, are eligible for, and participate in, smartphone-delivered interventions targeting health behavior change. The steadily increasing rate of smartphone ownership in the US will render these interventions highly disseminable. Researchers and clinicians should consider smartphone-delivery as a feasible and acceptable means of intervention delivery in diverse populations, especially for individuals who are unable to regularly attend traditional in-person behavioral interventions.

THEORETICAL FACTORS ASSOCIATED WITH REAL-TIME USE OF AN MHEALTH APP DESIGNED FOR HIV SELF-MANAGEMENT

Maya Baumann, MSN, MPH[1], Marcia Holstad, PhD, FNP-BC[2]

[1]Emory University, Peachtree Corners, GA; [2]Emory University, Atlanta, GA

Background: Despite the ubiquity of mobile health (mHealth) apps, few mobile phone users consistently integrate them into their daily lives. Not many empirical studies explore reasons behind this lack of sustained interest by focusing on theory-based factors that potentially influence mHealth app acceptance/usage from an end-user perspective.

Purpose: Guided by the modified Unified Theory of Acceptance and Use of Technology (UTAUT2), this secondary analysis of data from the Music for Health Project (MFHP) – an mHealth app-based HIV self-management intervention (iApp) conducted in rural Georgia – evaluated theoretical factors associated with the acceptance and real-time adoption of the iApp.

Methods: We compared the results of UTAUT2, smartphone experience (SPexp), and electronic health (eHealth) literacy surveys with iApp usage among 34 MFHP persons living with HIV/AIDS (PLWHA) in the first 100 days of study participation. Except for SPexp (baseline only), surveys were administered at baseline/three months and measured UTAUT2 constructs (behavioral intention [BI], effort expectancy [EE], hedonic motivation [HM], and performance expectancy [PE]) and eHealth literacy (confidence finding/using Internet-based health information). Usage metrics included frequency of iApp openings and duration of time spent in the app.

Results: At baseline and three months, most scored at or near the highest attainable in all surveys. UTAUT2 subscales, eHealth literacy, and SPexp were positively intercorrelated with each other (all $p \leq .05$) but not with frequency or duration of iApp usage. Younger participants (Mdn 31-33 years) scored the highest in the UTAUT2 survey, indicating the most intent (BI) to adopt mHealth apps and reporting stronger beliefs that mHealth apps could be easy to use (EE), enjoyable (HM), and helpful to maintain health ([PE], all $p < .025$). Despite the near universal willingness to adopt mHealth, almost half (14/34, 41%) did not open the iApp - these individuals were typically newly diagnosed with HIV less than six months prior to entering the MFHP ($p < .025$). Among those who did open the app, both frequency and duration of use peaked in the first four weeks of the study, then declined to almost zero over the next nine weeks.

Conclusions: Findings indicate that a person’s theoretical *willingness* and his/her behavioral *readiness* to use mHealth are not the same. Thus, the intention to adopt mHealth does not necessarily translate into initial or sustained action. Factors moderating this intention-behavior mismatch should be more fully evaluated. Moreover, a "one-app-fits-all" approach might not be the most effective way to improve disease self-management equally among all HIV-positive patients. Newly diagnosed PLWHA may require an mHealth app specifically geared to their needs in order to improve disease outcomes and engagement-in-care in this vulnerable group.

USING FOCUS GROUPS TO INFORM DEVELOPMENT OF A FACEBOOK INTERVENTION FOR TOBACCO USE AND HEAVY EPISODIC DRINKING

Danielle Ramo, PhD[1], Manpreet Kaur, M.A[2], Derek Satre, PhD[2], Judith J. Prochaska, PhD, MPH[3], Ella Corpuz, B.S[2], Sandra A. Brown, Ph.D.[4], Nicolas Sheon, Ph.D.[2]

[1]University of California, San Francisco, San Francisco, CA; [2]University of California San Francisco (UCSF), San Francisco, CA; [3]Stanford University, Stanford, CA; [4]University of California San Diego (UCSD), La Jolla, CA

Introduction. Intervention addressing smoking and heavy episodic drinking (HED) may result in better tobacco and alcohol outcomes for young adults who exhibit both behaviors. We analyzed qualitative data from focus groups to inform development of an intervention for smoking and HED on Facebook. *Method:* Young adults (N=25, M age = 20.3, 12% female, 72% non-Hispanic White) aged 18-25, who reported past month smoking and HED (5+ for men, 4+ for women) were recruited through Facebook and assigned to one of the three 90-minute focus groups on Facebook. Focus groups followed a semi-structured guide facilitating discussion around smoking, drinking, and social media intervention. Content was independently coded by two research staff using a grounded theory approach until saturation was reached. *Results.* Participants were 40% daily smokers who smoked an average of 5 cigarettes per day on 4 days per week. Participants reported drinking 9 (SD=6.6) days and 8 (SD=6.2) HED episodes in the past month on average. Drinking and smoking was reported most commonly in social contexts including with friends and at parties. Few reported ever trying to change smoking or drinking and none had ever tried an online group to quit. Participants were more receptive to quitting smoking than drinking, and preferred an intervention targeting one substance over a combined intervention. Participants had mixed reactions to joining a group on Facebook targeting smoking and/or drinking, with main concerns being related to privacy and not being ready to change use of either substance. However, there were many suggestions as to what would be appealing in an intervention, including about one social media post daily that would address smoking and drinking separately. Most people were inclined towards seeing pictures and videos in posts. Participants were interested in live sessions with a counselor and suggested once a week for 20-30 minutes. Most participants reported they were not aware of or not concerned about Facebook privacy policies, but had concerns about sharing information about substance use on FB. *Conclusions/Discussion:* Given low motivation to change tobacco use and HED, social media intervention for combined tobacco use and HED should focus on motivational enhancement and engagement. Integrated intervention is warranted and should take into

account the social context of combined tobacco use and HED, but early focus of an intervention may need to separate information about tobacco and alcohol use for highest receptivity.

MEDIA COVERAGE OF A CRISIS RESPONSE: EXPLORING EBOLA AND TRAVELER HEALTH

Federico P. Feldstein, JD, MA[1], Sarah Ray, MA[2], Susana Peinado, PhD[3], Brittany Zulkiewicz, BS[4], Brian G. Southwell, PhD[3], Heather Bair-Brake, MS DVM DACVPM [5]

[1]CDC/NCEZID/DGMQ/QB, Atlanta, GA; [2]RTI International, Atlanta, GA; [3]RTI International, Research Park Triangle, NC; [4]RTI international, Waltham, MA; [5]CDC/NCEZID/DGMQ/QBHSB, Atlanta, GA

Media Coverage of a Crisis Response: Exploring Ebola and Traveler Health

Federico Feldstein[1], Sarah Ray[2], Susana Peinado[2], Brittany Zulkiewicz[2], Brian Southwell[2], Heather Bair-Brake[1]

- CDC
- RTI International

The Check and Report Ebola (CARE) program, implemented by CDC in October 2014, was designed to support monitoring of travelers entering the US from a country with an Ebola outbreak. One component of the evaluation of the CARE program is an effort to understand the information environment in which CARE was created and implemented, including how media coverage may have been related to key events in the epidemic. We analyzed the volume of coverage related to CDC's response and the CARE program, focusing on enhanced entry risk assessment and post-arrival monitoring. We searched US newspapers and TV news transcripts available through Nexis® between July 1, 2014-June 30, 2015, which corresponded with the major events of the outbreak and response in the US. We used Google Trends to examine the association between news coverage and online searches to provide insight into how the public responded to media coverage by looking for additional information. The volume of media coverage and online searches corresponded with major events in the US throughout the timeline of the Ebola crisis, peaking in early October 2014 with the diagnosis of the first imported case of Ebola in the US. By the time entry risk assessment and monitoring began for all travelers from countries with outbreaks, media coverage and online searches had begun to decrease, largely declining by the first week of November. Among TV news sources, CNN was the main driver of coverage, beginning with early coverage of two American healthcare workers brought to the US for treatment through CDC's announcement of entry

risk assessment and monitoring procedures and the implementation of the CARE program. Among newspapers, *The Washington Post* included the most coverage of key topics throughout the selected timeframe. Understanding how the volume of coverage changed over time provides important context to describe the environment in which this response took place. This analysis provides program planners with information that can be used for media advocacy and strategic and emergency risk communication in future crises. Next steps may include a focused analysis of the content of media coverage, as well as an analysis of relevant conversations on social media.

F026 11:45 AM-12:45 PM

SIMULATION FOR CHRONIC PAIN OPIOID MANAGEMENT: SYMPATHY AFFECTS PHYSICIAN PRESCRIBING DECISIONS

Marissa Heirich, BS[1], Sean Mackey, MD, PhD[1], Jordan Newmark, MD[2]

[1]Stanford University School of Medicine, Palo Alto, CA; [2]Stanford University School of Medicine, Redwood City, CA

Opioid related deaths are a major public health issue. Physician overprescribing has been blamed as a major cause. While many physicians prescribe safely, some do not. Physician characteristics and patient-physician interaction factors must be assessed to determine what leads to improper prescribing. Simulation is an emerging tool in health education, which allows for observation and feedback in a consistent clinical setting. Here, we used simulation to characterize factors associated with safe and unsafe opioid prescribing.

Twenty pain medicine trainees participated in an opioid simulation at the Stanford Center for Immersive and Simulation-based Learning. Participants were oriented to a simulated patient (SP) story, which indicated risk for abuse, and to on-site Risk Evaluation and Mitigation Strategy tools. Participants were given 45 minutes to interact with the SP and type an encounter note. SPs provided feedback on a standardized instrument, which included a patient-provider interaction score (PPI) and overall score (OS). Participants also completed the Thomas-Kilmann Conflict Mode Instrument (TKI), which measures five conflict-handling modes. All interactions were video recorded and sent to RIASWorks for coding using the Roter Interaction Analysis System (RIAS).

Both PPI (M=5.87, SD=1.02) and OS (M=6.05, SD=1.13) were scored on a 9-point Likert scale. Participants with higher scores for RIAS global affect ratings such as interest, warmth, respect, and sympathy showed strong and significant relationships with higher SP scores for both PPI and OS. Higher physician affect ratings of anxiety and anger reflected lower ratings for PPI and OS as well. Participants who scored higher on the avoiding TKI mode had lower emotional rapport-building scores (r= -.692, p=.001), and made less empathetic and reassuring statements. Higher collaborating TKI scores were reflective of higher OS scores (r =.453, p =.045) and engaged affect (r=.491, p=.028). Physicians who were rated with higher sympathy scores (M=4.56, SD=.727) were more likely to prescribe opioids than those with lower scores (M=2.75, SD=.957); t(18) = 3.539, p=.025.

Our pilot findings suggest physicians’ global affect and conflict-handling have effects on both patient-reported outcomes and decision making in a simulated opioid interaction. While sympathy played a role in building social rapport and higher patient satisfaction, it also influenced physicians' prescribing decisions for a high risk patient. Further simulation studies are needed in order to better characterize these factors and translate this knowledge into improved education on safe opioid prescribing.

WHY HELP OTHERS WHEN YOU CAN HELP YOURSELF? A STUDY INVESTIGATING THE EFFECTIVENESS OF FLU VACCINATION MESSAGES

Melissa A. Shepherd, PhD[1], Mary A. Gerend, PhD[2], E. Ashby Plant, PhD[3]

[1]University of Montevallo, Montevallo, AL; [2]Northwestern University, Chicago, IL; [3]Florida State University, Tallahassee, FL

Influenza infection is associated with social and financial concerns (e.g., missing events or work due to illness) as well as negative health outcomes (e.g., hospitalization, premature death). By receiving the flu vaccine people not only protect themselves from the virus; they also protect others. Certain vulnerable populations (e.g., infants, the elderly, immuno-compromised patients) may be unable to receive the vaccine and thus rely on herd immunity (i.e., high rates of vaccination in a population to reduce risk of contracting the virus). We conducted two experiments to examine whether educating individuals about the benefits of flu vaccination for themselves only (self-focused) or for themselves and vulnerable others (herd-focused) would lead to more favorable attitudes and stronger intentions to get vaccinated. We hypothesized that the herd-focused message would be more effective than the self-focused message. Furthermore, we hypothesized that the herd-focused message would be even more effective for some people (e.g., females, democrats, people who had previously been vaccinated, collectivists). Study 1 included 186 Americans from Amazon's MTURK (ages 19 to 75, 58% male, 83% white). Study 2 included 78 American college students (ages 18-23, 73% female, 79% white). The method was identical for studies 1 and 2. Participants reported baseline vaccination attitudes, vaccination history, and personal characteristics. Participants were randomly assigned to read either a self-focused or herd-focused flu vaccination message. Lastly, participants reported their vaccination attitudes and intentions. Contrary to our hypotheses, participants who read the self-focused or herd-focused message reported equivalent vaccination attitudes and intentions. Additionally, personal characteristics like gender, political orientation, vaccination history, and collectivism/individualism did not interact with message type. Study 2 replicated these null findings. Findings suggest that adding information about herd immunity may not increase the effectiveness of flu vaccination messages. Results may have differed if herd-focused messages mentioned benefits to specific family members and/or friends rather than people in general.

MAPPING A SYNDEMIC OF PSYCHOSOCIAL RISKS DURING PREGNANCY AMONG HIV-INFECTED WOMEN IN SOUTH AFRICA

Karmel W. Choi, MA, PhD Candidate[1], Jennifer A. Smit, PhD[2], Nzwakie Mosery, BA[2], David R. Bangsberg, M.D.[3], Steven A. Safren, PhD[4], Christina Psaros, PhD[1]

[1]Massachusetts General Hospital/Harvard Medical School, Boston, MA; [2]Maternal, Adolescent, and Child Health Research Unit, Department of Obstetrics and Gynecology, Faculty of Health Sciences, University of the Witwatersrand, Durban, KwaZulu-Natal, South Africa; [3]Harvard Medical School/Massachusetts General Hospital, Boston, MA; [4]Department of Psychology, University of Miami, Coral Gables, FL

Background: A variety of risk factors are known to negatively impact maternal and child health across the perinatal period in resource-limited settings, and HIV-infected women often bear a heavy burden of these perinatal risk factors. According to syndemic theory, when risk factors cluster together, the combination of these risk factors tends to produce worse outcomes than any risk factor alone. This study sought to use network modeling to characterize the co-occurrence of psychosocial risks during pregnancy among HIV-infected women living in KwaZulu-Natal (KZN), South Africa, which has the world's highest rates of HIV among pregnant women.

Methods: A cohort of 200 HIV-positive pregnant women was recruited from antenatal clinics in KZN. Various risk factors were assessed during the third trimester, including antenatal depression; HIV-related stigma; exposure to physical violence; low-income status; low social support; unintended pregnancy; distress upon pregnancy recognition; and younger age at childbearing. Network analysis was conducted in R using mixed graphical modeling to visualize associations between risk variables, adjusting for variable type(s) and the presence of all other variables in the network. Centrality statistics were examined to assess relative importance of each node in the network.

Results: The resulting network revealed complex relationships between risk factors. Of note, antenatal depression was associated with distress upon pregnancy recognition, which was strongly tied to unintended pregnancy. Antenatal depression was also connected to low social support and marginally to physical violence exposure. In turn, low social support was associated with low-income status and HIV-related stigma. Furthermore, HIV-related stigma

was independently associated with distress upon pregnancy recognition, as was younger age. The most central risk factor in the network was distress upon pregnancy recognition, which served to connect several other factors.

Conclusions: Our results characterize a network of psychosocial risks during pregnancy in a sample of HIV-positive women in South Africa. Emotional aspects of unintended pregnancy emerged as a central feature of this network, suggesting that unintended pregnancy in contexts of poverty, younger age, HIV-related stigma, and low social support is particularly distressing and may even contribute to further risks to maternal and child health, such as depression. Prevention of unintended pregnancies and interventions for coping with unplanned pregnancies may be especially critical in populations where multiple risks intersect. In addition, efforts targeting single risk factors (e.g., depression) should recognize the influence of other contextual variables and consider an integrated, multilevel approach to supporting the wellbeing of HIV-infected women during the perinatal period.

AN INNOVATIVE POPULATION HEALTH MODEL REDUCES EMERGENCY DEPARTMENT UTILIZATION IN A LARGE URBAN HOSPITAL SYSTEM

Kenneth Halloran, MPH[1], Heather Kitzman, PhD [2], Donald E. Wesson, MD MBA[3], Lindsey Philpot, PhD MPH[4]

[1]Baylor Scott and White Health and Wellness Center, dallas, TX; [2]Baylor Scott and White Health and Wellness Center, Dallas, TX; [3]Baylor Scott & White Health, Dallas, TX; [4]Mayo Clinic Robert D. and Patricia E. Kern Center for the Science of Health Care Delivery, Rochester, MN

Background: Individuals who are uninsured and from lower income communities have higher rates of chronic disease and are typically greater utilizers of emergency department (ED) and inpatient (IP) health services. Population health approaches that integrate individual, community, and environmental factors with access to a patient centered medical home have the potential to improve health and reduce health inequities and healthcare costs. This study evaluated whether individuals who accessed the Baylor Scott and White Health and Wellness Center (BSW HWC) had reduced ED or IP health services at Baylor Scott & White Health, a large urban hospital system in Dallas, TX.

Methods: The BSW HWC, a population health approach of Baylor Scott and White Health, located in an underserved urban community, contains: 1) a medical clinic, 2) a city maintained recreational center, 3) a teaching kitchen, 4) prevention programs for diabetes, weight management, and wellness, 5) access to community health workers for navigation, 6) social services, 7) weekly farm stands, 8) community outreach staff, and 9) academic and research staff. Participants with two or more visits to the BSW HWC between January 2010 and January 2015 were included in this analysis. Baylor Scott & White Health ED and IP utilization prior to and following initiation of care at the BSW HWC was evaluated with t-test and chi-square statistics.

Results: Data included 906 and 322 participants for the ED and IP utilization analysis, respectively (N=1056, 56% African American, 31% Hispanic, 8% Caucasian, 65% female, 65% uninsured, 14% Medicaid/Medicare, mean age = 50.0±13.3). The average number of Baylor Scott & White Health ED encounters significantly decreased by 17.7% ($p < .001$) following initiation of care at BSW HWC with an average cost decrease of 34.5%. The average number of Baylor Scott & White Health IP encounters decreased 36.7% ($p < .0001$) following initiation of care at BSW HWC with an average cost decrease of 54.4%.

Conclusion: As rates of chronic disease rise, particularly in lower income communities, population health approaches that improve health outcomes and act cost effectively will need to be adopted. Approaches that address social determinants of health, access to health care, prevention and management services, and ancillary health services can reduce ED and IP utilization in large urban healthcare systems leading to better population health and reduced costs.

COMORBIDITY OF ANXIETY AND DEPRESSION IN A CLINICAL SAMPLE OF INTERNALIZING YOUTH

Angela W. Wang, M.Ed[1], Argero A. Zerr, Ph.D.[2], Karen T.G. Schwartz, M.S. [3], V. Robin W. Weersing, Ph.D.[3]

[1]San Diego State University, San Diego, CA; [2]San Diego State University, Suite 200, CA; [3]SDSU/UC San Diego Joint Doctoral Program in Clinical Psychology, San Diego, CA

Comorbidity and Severity of Anxiety and Depression in a Primary Care Sample of Anxious and/or Depressed Youth

Objectives: To examine the sociodemographic and clinical characteristics of youths with anxiety compared to youths with comorbid anxiety and depression in a primary care sample of internalizing youths.

Brief rationale: One-third of adolescents meet DSM-IV criteria for an anxiety disorder, and 11.4% for depression (Merikangas et al., 2010). Furthermore, 10-15% of youths meet criteria for both (Nolen-Hoeksema & Hilt, 2010), putting them at risk for increased impairment over time (Garber & Weersing, 2010). Most internalizing youths are less likely to be identified by parents and teachers, compared to externalizing youths; thus, primary care service providers are usually the first line of defense in identifying this population (Dwyer, 2006). Therefore, the present study, based in a primary care setting, evaluated the additional burden that comorbid depression places on anxious youths, in terms of current symptom severity and impairment.

Methods: The current study evaluated baseline characteristics of 185 youths participating in a clinical trial in primary care (61.1% anxiety only, 32.4% comorbid depression). Clinical and sociodemographic characteristics between these two groups were compared.

Results: Youths meeting DSM-IV criteria for both anxiety and depression scored significantly and consistently higher than those in the anxiety only group on self- (Mc=37.85; Ma=27.96), parent- (Mc=34.28; Ma=29.88), and clinician- (Mc=45.35; Ma=16.08) rated measures of anxiety and depression symptoms (all $p < .05$), respectively. Comorbid youths were also more severe on many secondary symptom domains, including hyperactivity (Mc=4.83; Ma=3.81), emotional symptoms (Mc=6.05; Ma=3.56), problems with peers (Mc=3.10; Ma=2.41), and suicidal risk (Mc=.03; Ma= -.65), (all $p < .05$). Furthermore, anxious youths without depression scored significantly higher on current levels of general functioning (Mc=52.17; Ma=58.22).Analyses supported that a comorbid presentation was associated with increased symptom severity and clinical complexity (Bernstein, 1991; Garber & Weersing, 2010). The final poster will explore treatment response in an effort to inform intervention selection in comorbid cases. Additional sociodemographic comparisons (e.g., gender, race, education level) may also help address baseline health disparities in primary care settings, which may contribute to the translation of mental health behavioral medicine research into policy and practice.

INNOVATIVE PLATFORM (MEVOKED) USES DIGITAL FOOTPRINT TO SUPPORT DEPRESSION MANAGEMENT IN PRIMARY CARE

Kristin Vickers Douglas, Ph.D., ABPP[1], Julie Hathaway, MA[2], Arun Ravi, MBS[3], Juan Pablo Ferrer, PsyD, EdM [4], Angela Mattson, D.N.P., M.S., R.N.[5], Mark Williams, M.D.[6]

[1]Mayo Clinic Department of Psychiatry and Psychology, Rochester, MN; [2]Mayo Clinic, Rochester, MN; [3]Mevoked Inc., San Francisco, CA; [4]Mevoked, INC., San Francisco, CA; [5]Department of Nursing, Mayo Clinic, Rochester, MN; [6]Integrated Behavioral Health, Mayo Clinic, Rochester, MN

Effective depression management in primary care often includes use of a clinical registry to track patient symptom severity and response to treatment over time, nurse care coordination, and patient self-management support. While accurate and repeated depression assessment data are necessary for optimizing clinical treatment, patients with depression have barriers to adherence (Wing et al., 2002), including completion of self-report measures and clinical data collection with calls and clinic visits. MEVOKED program uses the individual's "digital footprint" to collect data relevant to a depressed person's self-management (e.g., minutes of online activity during the night, emotional valence of online content). Additionally, pop-ups collect quick and simple ratings of mood, quality of life, and medication adherence. MEVOKED provides a weekly summary of online behavior and self-assessment ratings emailed to the patient. In this study, a team of mental health providers, technology developers, and patient education researchers, assessed the feasibility and acceptability of MEVOKED within a primary care clinic already successfully implementing depression care management. Patient and provider use and satisfaction with MEVOKED were assessed with individual qualitative interviews. Data sources also included user behavior metrics, such as pop-up response rate and rating scales. A convenience sample of patients provided informed consent and qualitative and quantitative data to assess the addition of MEVOKED to their current depression management program. Of 35 participants using MEVOKED, 21 completed a qualitative interview (week 6 and 12). Subgroup analysis of clinical data (PHQ-9 scores, diagnoses, psychiatric medication) indicated participants were representative of patients enrolled in depression management. Qualitative interview data were analyzed by behavioral researchers experienced in *NVivo* qualitative data analysis software and methods of content analysis. Predominant patient themes included increased awareness of mood states and usefulness of behavioral prompts for medication adherence. Participant mean ratings (0-10; 0 = very negative/none; 10 = very positive/high) for MEVOKED program at end of study: 7.36 (SD = 2.92) for overall impression of MEVOKED); 7.54 (2.81) for perceived added value

treatment and 8.50 (2.96) for likelihood of recommending MEVOKED to others. User difficulties with technology were communicated to MEVOKED team allowing for responsive program refinement. Provider feedback emphasized integrating MEVOKED data into existing clinical systems to minimize burden. For those actively using MEVOKED, individualized reports of online behavior and mood ratings contributed to depression self-management and were perceived by many as a valuable addition to evidence-based depression management.

THE IPE DEBRIEFING HOUR: CREATING SPACE WITHIN INTERPROFESSIONAL EDUCATION TO FACILITATE AND PROCESS LEARNING

Leila Islam, Ph.D.[1], Kathleen Pincus, PharmD, BCPS[2]

[1]University of Maryland-Baltimore School of Medicine, Baltimore, MD; [2]Department of Pharmacy Practice and Science University of Maryland School of Pharmacy, Baltimore, MD

We developed an interprofessional education (IPE) experience where students from schools of pharmacy, medicine, and social work longitudinally to serve as a care coordination team for patients identified complex and at high risk for unplanned healthcare utilization. Over the course of 10 four-week blocks, students and medical and pharmacy residents cared for 36 patients within a high volume clinic. Participating students (N = 29) in the pilot phase of its development were in their late 20’s (M = 29 years old), mostly women (72%), and largely White (38%) or Asian (38%). Students completed a pre-and-post measure evaluating their attitudes toward health care teams (Heinemann, 1999), including assessment of their attitudes toward the quality of care achieved through collaborative care and physician centrality. No significant change in attitude was demonstrated among the participants, likely because participants involved in the learning experience were to some degree interested in interprofessional care and thus provided scores favorable of IPE.

Lessons learned from this pilot project stemmed largely from the debriefing sessions facilitated by one or both of the authors, held for one hour at the end of Weeks 1, 3, and 4. These sessions provided the opportunity for learners to reflect in formal debriefing sessions on the experience of working as an interprofessional team. Debriefings included structured activities, including “getting to know you” exercises and discussion of assigned articles, and the creation of a safe space in which students learners processed their experience of IPE. We aim to share the barriers and facilitators experienced throughout the development of this program, which we have continued into its second year, with the goal to aid others interested in creating similar IPE programs at their own institutions.

EXAMINING JOHN HENRYISM AND MEDICATION ADHERENCE AMONG AFRICAN-AMERICAN WOMEN WITH HYPERTENSION

Yendelela Cuffee, Ph.D., MPH[1], Jeroan Allison, MD, MSci[2]

[1]Penn State College of Medicine, Hershey, PA; [2]University of Massachusetts Medical School, Worcester, MA

John Henryism is a measure of maladaptive active coping that has been linked with health conditions including hypertension, diabetes, and prostate cancer. Few studies have examined the relationship between John Henryism and health behaviors among individuals with hypertension. Forty-seven percent of African-American women have hypertension, and approximately half have controlled hypertension. Adherence to antihypertensive medications is essential for hypertension control and preventing hypertension-related complications. The objective of this study was to examine the relationship between John Henryism and medication adherence among African-Americans women with hypertension. Data were obtained from the TRUST study, and included 553 African-American women with hypertension receiving care at a safety-net hospital in the Deep South. Medication adherence was measured using the 4-item Morisky Medication Adherence scale and John Henryism was measured using the 12-item John Henryism Active Coping Scale. Associations were quantified using ordinal logistic regression and adjusted for age, education, income and physical and mental health status. Within our sample of African-American women, individuals with high John Henryism scores reported lower adherence to medication (OR: 0.95, CI: 0.92-0.99). Our findings also indicated that higher self-reported mental health status (OR: 1.04, CI: 1.02-1.05) was linked with greater adherence. This study of John Henryism provides insights to the complex psychological and behavioral responses to stress seen among African-American women with hypertension. The findings of this study support the need for interventions that promote coping strategies and tailored approaches for improving medication adherence among African-American women.

PATIENT ATTITUDES TOWARDS AN INGESTIBLE BIOSENSOR MEDICATION ADHERENCE SYSTEM

Peter R. Chai, MD MMS[1], Brendan Innes, BS[2], Stephanie Carreiro, MD[2], Brittany Chapman, BS[2], Sae Jin Oh, BS[2], Theodore Mooncai, BS[2], Edward W. Boyer, MD PhD[3]

[1]Brigham and Women's Hospital/Harvard Medical School, Boston, MA; [2]University of Massachusetts Medical School, Worcester, MA; [3]Department of Emergency Medicine, Brigham and Women's Hospital, Boston, MA

Introduction: Measuring medication adherence in the real-world is fraught with difficulty. Direct measures of adherence monitoring (eg. directly observed therapy) are one of the few methods that provide reliable confirmation of medication ingestion and adherence. A novel direct measure of adherence, such as a digital pill, can provide reliable ingestion data in the real-world. Digital pills are composed of a radiofrequency emitter in a standard gelatin capsule encapsulating a desired medication. Upon ingestion, the digital pill is activated, transmitting real-time ingestion data to a cloud-based program that displays adherence data to clinicians. We have previously reported successful deployment of digital pills for opioid ingestion pattern monitoring from the emergency department (ED). Here, we report initial qualitative data regarding patient attitudes, beliefs and preferences towards use of this system for medication adherence.

Methods: We conducted our study at an academic, urban emergency department (ED) in individuals who were >18 years old, English speaking, without a history of substance abuse, and sustained acute fractures that would be treated on an outpatient basis. Study participants were outfitted with a digital pill (eTectRx, Newbury FL) and received brief instruction on operating the system prior to discharge. Participants used the digital pill for one week, and returned to our clinical research center for a guide-based open-ended interview regarding attitudes/beliefs/preferences of the ingestible biosensor system. Interviews were transcribed, reviewed and analyzed using the technique of applied thematic analysis.

Results: During our study period, 26 individuals were eligible for the study. We approached and consented 12 participants. Eleven participants (92%) reported acceptance of the digital pill and the monitoring device, finding the technology easy to operate after the training session in the ED. Nine participants (75%) perceived real-time adherence monitoring through a digital pill as acceptable and valuable. Nine participants (75%) found reassurance in confirmatory text messages, and would have preferred consistent reminder messages to reinforce adherence. Seven participants (58%) reported they would have preferred increased

battery life and a smaller hip monitor. No participants reported concerns regarding privacy of data transmission.

Conclusion: Digital pills are acceptable as a medication adherence monitoring device among ED patients. Mobile phone-based confirmatory text messages are an acceptable method to deliver real-time adherence data to users of digital pills.

CHANGES IN BOTH DIET AND EXERCISE IMPROVE DEPRESSION SYMPTOMS AMONG PERMANENT SUPPORTIVE HOUSING RESIDENTS

Whitney Mollenhauer, MA[1], Scott Walters, PhD[2], Subhash Aryal, PhD[1], Esther Holmes, MPH, CHES[1]

[1]University of North Texas Health Science Center, Fort Worth, TX; [2]University of North Texas Health Science Center, Ft. Worth, TX

Background: There is increasing evidence supporting lifestyle interventions for depression. For example, there is strong evidence for an inverse relationship between physical activity and depressive symptoms. In addition, there is growing evidence supporting dietary interventions as an effective treatment approach for depression. While depression disproportionately affects people with low income or a history of homelessness, it is unclear if exercise, diet, or a combined treatment approach should be emphasized in interventions for depression among this population.

Methods: We used baseline and 6-month follow-up assessments from 315 people who were participating in m.chat, a technology-assisted health coaching program for people with mental health symptoms residing in permanent supportive housing. Subjects were categorized into 4 groups based on their improvement in diet and/or exercise over this 6-month period: Group 1 consisted of subjects who improved both diet and physical activity; Group 2 consisted of subjects who improved diet only; Group 3 consisted of subjects who increased physical activity only and Group 4 consisted of subjects who did not improve on either measure.

Results: We calculated the change in Patient Health Questionnaire (PHQ-9) scores between baseline and 6 months and compared the difference between the 4 groups using a one-way ANOVA. A statistically significant difference was observed between the groups (F3,311 = 3.12, p = 0.0263). Next, we conducted pairwise comparisons among the 4 groups and observed a significant difference between groups 1 and 4 (Mean difference = 3.076, 95% CI 0.154 -5.997) after making Bonferroni corrections for multiple comparison. On average, PHQ-9 scores were 3 points lower for subjects who made improvements on both diet and exercise compared to those who did not make any improvement in either category.

Conclusion: Lifestyle interventions for depression that target both physical activity and diet may be more effective than interventions that target either physical activity or diet alone in members of disadvantaged populations.

EVALUATION OF AN MHEALTH APP: A PILOT TRIAL OF ‘DESTRESSIFY’ ON UNIVERSITY STUDENT MENTAL HEALTH

Rebecca A. Lee, BScH[1], Mary E. Jung, PhD[2]

[1]University of British Columbia, Vancouver, BC, Canada; [2]University of British Columbia, Kelowna, BC, Canada

1 in 5 Canadians experience mental health issues (Smetanin et al., 2011), with those aged 15 to 24 being most at risk (Statistics Canada, 2013). Mental health issues are of a particular concern for university students as they have shown significantly higher rates of mental health problems than the general public (Stallman, 2010). Current university support services are limited by factors such as available staff and finances, and social stigma has frequently been identified as an additional barrier that prevents students from accessing these resources (Eisenberg, Golberstein, & Gollust, 2007; Sasaki & Sasaki, 2014). Mobile health (mHealth) apps are one form of alternative health support that is discrete and accessible to students, and while they are recognized as a promising alternative, the efficacy of such apps has yet to be demonstrated through research (Donker et al., 2013).

The efficacy of the commercially available app Destressify Pro was tested in a sample of 163 undergraduate students from the University of British Columbia Okanagan using validated measures of quality of life, stress, anxiety, depressive symptomatology, sleep quality, and work productivity. Individuals in the experimental group (n=77) received Destressify Pro and were instructed to use the app for 4 weeks before completing a follow-up survey. Participants in the wait list control group (n=86) received no intervention material.

The experimental and control groups were statistically similar at baseline in terms of age, sex, ethnicity, program enrolment, mental health diagnosis percentage, and mental health service use (p>.05). Responses were compared between treatment groups using ANCOVA, repeated measures (RM) ANOVA, and RM MANOVA. App use was associated with lower trait anxiety (p=.005), higher energy and less fatigue (p=.005), as well as greater emotional wellbeing (p=.002). These differences were all of small effect size (h_p^2.05).

This research provides insight into the efficacy of mHealth apps in improving stress, anxiety, and related symptomatology in university students. The results of this study may be used by student-focused mental health support services to develop future initiatives using an evidence-based mHealth app to best support students. While changes in stress were not statistically different between groups (p=.06), mean changes over time were noteworthy in that the experimental group appeared to be decreasing in stress values (M_{pre} = 18.58; M_{post} = 17.78) as compared to control group (M_{pre} =19.60; M_{post} =19.84). Similarly, depressive symptomatology was not statistically different between groups but also showed similar trends (M_{exppre} = 8.36; $M_{exppost}$ = 6.36; M_{conpre} = 8.08; $M_{conpost}$ = 7.37). Future research may benefit from examining Destressify Pro and similar mHealth apps over a longer period of time and in university staff and faculty.

MENTAL HEALTH STIGMA AND ATTITUDES TOWARD SEEKING MENTAL HEALTH SERVICES IN TAIWANESE IN TAIWAN AND US

Yung Fang Irene Chung Chavez, M.A.

California School of Professional Psychology at Alliant International University - Los Angeles, San Gabriel, CA

Limited research has examined mental health in Taiwanese in Taiwan and Taiwanese descent in the US. The aim of the current study is to examine: 1) the relationship between mental health stigma (MHS) and mental health help seeking attitudes (MHHSA) in Taiwanese in Taiwan and in the US; 2) the association of acculturation with MHS and MHHSA; 3) whether loss of face moderates the relationship between MHS and MHHSA, and 4) factors that should be addressed by culturally appropriate interventions to reduce MHS and improve MHHSA in Taiwanese in Taiwan and the US. The sample consisted of 243 participants (114 Taiwanese in Taiwan and 129 Taiwanese descent in the US). Participants completed an online survey assessing mental health self-stigma, public stigma, loss of face, acculturation (for US sample only), and MHHSA. Independent-Samples t-Test and Hierarchical Multiple Regression analyses were conducted. The results showed that Taiwanese in Taiwan reported greater levels of self-stigma (M = 2.34, SD = .54) than Taiwanese in the US (M = 2.18, SD = .61), $p < .05$. However, differences in public stigma was not found between the two groups. Taiwanese in the US (M = 3.12, SD = .47) reported significantly more positive MHHSA than their counterparts in Taiwan (M = 2.91, SD = .46), p =.001. Increased levels of self-stigma and public stigma significantly predicted less positive MHHSA for both groups. Acculturation as measured by levels of immersion into Taiwanese and US mainstream cultures predicted MHHSA. Specifically, greater levels of immersion into Taiwanese culture significantly predicted less MHHSA (B = -.01, SE = .002, p = .001) whereas greater levels of immersion into US culture significantly predicted more positive MHHSA, B = .01, SE = .002, p = .005. Loss of face did not moderate the relationship between MHS and MHHSA in both Taiwan and US samples. The results of this study inform research on the relationship between MHS and MHHSA. This finding calls for future examination of other factors that may moderate the relationship between MHS and MHHSA. Findings also highlight the significance of developing interventions to reduce mental health stigma and also interventions that are sensitive to cross-cultural and acculturative differences across Asian and other immigrant populations.

REACTIONS TO ACUTE MEDICAL EVENTS: TRAUMATIC VS. NON-TRAUMATIC STRESSORS

Anna-Leigh Powell, B.S., Kelsey C. Hewitt, M.S., D. Brian. Haver, B.S., B.A., Meghan W. Cody, Ph.D.

Mercer University, Atlanta, GA

Posttraumatic stress disorder (PTSD) is one of the few psychopathologies requiring a specific antecedent for the diagnosis. Criterion A for PTSD in the DSM-5 defines a traumatic event as one that involves exposure to actual or threatened death, serious injury, or sexual violence. Operationalizing what constitutes a trauma is challenging as individual perceptions and appraisals differ and can alter the impact of the event (Stein, Wilmot, & Solomon, 2016). One area where this distinction is especially difficult to discern is medical illness. Research on PTSD due to acute medical events has largely focused on heart attacks and strokes, two life-threatening occurrences that do meet the Criterion A threshold. However, some non-traumatic medical stressors may be associated with similar psychological effects (Edmondson, 2014). The purpose of the current study is to explore the impact different types of acute medical events/stressors (AMES) have on subjective responses and psychological symptoms.

Participants (N = 51) completed an online study of reactions to AMES, defined as serious acute illness or stressful diagnostic/treatment procedures. Participants first reported which AMES they had experienced (out of a list of 10) and identified the one they considered most distressing. Next, they answered questions about their subjective responses to the event, including pain, helplessness, fear, belief that they would die, and current distress. AMES were classified into categories to reflect whether or not they met Criterion A. Traumas (e.g., heart attack, miscarriage; n = 17) were compared to non-traumatic stressors (e.g., surgery, diagnostic procedures; n = 34) to identify differences in subjective responses and scores on measures of PTSD (PTSD Checklist; PCL-5) and depression (Beck Depression Inventory; BDI-II).

Results showed no significant differences between trauma groups for subjective responses, PTSD symptoms, or depression symptoms. However, regressions predicting symptoms from subjective response scales were significant; PCL: $R^2 = .38$, $p < .001$; BDI: $R^2 = .24$, $p = .018$. Belief that one would die was the only significant predictor (at the time of the event) for both PTSD symptoms ($\beta = .38$, $p = .004$) and depression ($\beta = .35$, $p = .015$). This suggest that whether a medical stressor meets PTSD Criterion A is less important than the patient's interpretation of the event in determining its long-term effects on mental health.

SCREENING OF MOOD SYMPTOMS IN NEW PATIENTS PRESENTING TO REPRODUCTIVE ENDOCRINOLOGY CLINIC: TIME FOR EARLY INTERVENTION?

Abbey Kruper, Psy.D.

Medical College of Wisconsin, Milwaukee, WI

AIM
Women are at greatest risk for mood disorders during childbearing years and infertility is a significant and stressful life event further impacting emotional well-being. The aim of this study was to determine presence of clinically significant anxiety or depression in new patients establishing care within reproductive endocrinology clinic with goal of early intervention with clinical health psychologist.

METHODS
Data was collected for all new patients presenting to the Reproductive Endocrinology clinic for consultation regarding infertility. A total of 170 patients were assessed during a 3-month time period from April 2016 through June 2016. Fertility preservation consults were excluded. New patients were given the Patient Health Questionnaire-9 (PHQ-9) and the Generalized Anxiety Disorder-7 (GAD-7) scale by nursing staff to complete prior to their physician appointment. Scores were calculated for the presence of mild, moderate, or severe symptomatology. A cut-off of 10 indicating moderate anxious or depressed symptoms was set to prompt physician discussion regarding emotional well-being with patients and referral for psychological intervention early in treatment process.

RESULTS
Of the 170 patients evaluated, 126 of the patients (74%) scored below 5 on both measures indicating minimal to no emotional distress at this early time point in the fertility process. 33 patients (19%) endorsed mild symptoms of depression or anxiety and the remaining 11 patients (7%) indicated moderate symptoms. No patient endorsed severe symptoms of either depression or anxiety at this time point. Of the 11 patients indicating moderate symptoms, 7 patients were referred for initial psychological evaluation and 3 elected to schedule and attend the appointment.

CONCLUSIONS
Despite the incidence of mood disorders in general population and the stress associated with reproductive time period for women, a lower than expected amount of patients endorsed clinically relevant mood symptoms at their initial infertility consult. Of those that endorsed

clinically significant mood symptoms, relatively few followed through with establishing with health psychology. Ongoing assessment of whether there is clinical utility in initial psychological distress measures is warranted. Based on these results, for next steps clinical providers modified the threshold for referral to mild symptoms and initiated re-evaluation time points, including after failed treatment interventions when emotional distress is likely to increase. Barriers to early intervention with health psychologist should also be identified.

DEVELOPMENT AND ASSESSMENT OF HEALTH SURVEYS: FITTING A GRADED RESPONSE MODEL

Sarah Depaoli, PhD., Jitske Tiemensma, PhD, John Felt, MA

University of California, Merced, Merced, CA

Objective: The graded response model, an item response theory (IRT) model, can be used to improve the development of surveys, even when sample sizes are restricted. Typically, health-based survey development utilizes classical statistical techniques (e.g., reliability and factor analysis). In a review of four prominent journals within the field of Health Psychology, we found that IRT-based models were used in less than 10% of the studies examining scale development or assessment. However, implementing IRT-based methods can provide more details about individual survey items, which is useful when determining the final item content of surveys. An example using a disease specific quality of life (QoL) questionnaire for patients treated for Cushing's syndrome is discussed. Cushing's syndrome is a rare hormonal disease characterized by chronic exposure to elevated cortisol levels. Patients suffering from Cushing's syndrome serve as a disease model for chronic stress.

Design: Patients treated for Cushing's syndrome were recruited from a patient organization's (The Cushing's Research and Support Foundation) email listserv and Facebook. Patients completed an online version of the Cushing's Quality of Life (QoL) questionnaire (CushingQoL; English version) and demographic questions.

Results: Patients with Cushing's syndrome ($n = 397$) completed the CushingQoL. Results from the graded response model supported a 2-subscale scoring process for the survey [$M2(17) = 19.25$, $p = .31$). All items were deemed as worthy contributors to the survey (all slopes > 1.0).

Conclusion: The graded response model can accommodate unidimensional or multidimensional scales, be used with relatively lower sample sizes, and is implemented in free software. Use of this model can help to improve the quality of health-based scales being developed within Health Psychology.

FACTORIAL INVARIANCE AND RELIABILITY OF THE DECISIONAL BALANCE AND SELF EFFICACY SCALES FOR EXERCISE

Iman Almohammadi, Behavioral Science Doctoral Student[1], Wayne Velicer, Professor, Co-Director of Cancer Prevention Research Center[2], Joseph Rossi, Professor; Director of the Behavior Change Research Center[2], Colleen Redding, Research Professor, Cancer Prevention Research Center[2]

[1]University of Rhode Island, North Kingstown, RI; [2]University of Rhode Island, Kingston,, RI

Two crucial psychometric requirements for any measure are scale reliability and factorial invariance. This paper evaluates the Decisional Balance for Exercise and the Self-Efficacy Scale for Exercise, using a sample of parents or legal guardians of 9th-grade students (N = 347) across Rhode Island. Three levels of invariance were tested, from least to most restrictive: Configural Invariance, Pattern Identity Invariance, and Strong Factorial Invariance. **In Study I**, the Decisional Balance Scale for Exercise, consisting of two uncorrelated factors with three items each for (Pros) and (Cons) was evaluated. Strong Factorial Invariance was a good fit for the model across educational level (CFI: 0.92), Pattern Identity Invariance across gender (CFI: 0.94), annual income (CFI: 0.93), and stage of change (CFI: 0.91), and Configural Invariance across age (CFI: 0.95). Internal consistency (Coefficient Alpha) was .85 for Pros, and .69 for Cons. **In Study II**, the Self Efficacy Scale for Exercise had a hierarchical model that consists of two factors with two items for (Internal Confidence) and four items for (External Confidence). Strong Factorial Invariance was a good fit for the model across gender (CFI: 0.99), age (CFI: 0.92), educational level (CFI: 0.98), annual income (CFI: 1.00), and stage of change (CFI: 0.91). Coefficient Alpha was .36 for Internal Confidence, .68 for External Confidence, and .66 for the Total Scale. Together, invariance and reliability provide empirical support for the validity of these two measures.

IDENTIFYING ATYPICAL RESPONSES IN THE CUSHING'S QUALITY OF LIFE QUESTIONNAIRE: USING PERSON FIT STATISTICS TO DETECT OUTLIERS

John Felt, MA, Ruben Castaneda, NA, Sarah Depaoli, PhD., Jitske Tiemensma, PhD

University of California, Merced, Merced, CA

Context: Cushing's syndrome is a rare hormonal disorder characterized by the chronic overproduction of cortisol. Symptoms include physical, psychological, and health impairments. Upon remission, symptoms typically improve, however quality of life (QoL) remains impaired despite long-term remission. Because impairments in QoL are persistent in patients treated for Cushing's syndrome, the Cushing's QoL (CushingQoL) questionnaire was developed to evaluate disease specific QoL concerns. When evaluating QoL using the CushingQoL questionnaire, outlier detection is important. However, traditional methods of outlier detection (e.g., boxplots) can miss patients with "atypical" responses to the questions that otherwise have similar total (subscale) scores. In addition to detecting outliers, it can be of clinical importance to determine the reason for the outlier status, or "atypical" response.

Objective: The aim of the current study was to illustrate how to derive validity scores for outlier detection through a statistical method examining person fit.

Design and Patients: Patients treated for Cushing's syndrome (n=394) were recruited from the Cushing's Support and Research Foundations listserv and Facebook page. All patients were asked to complete an online version of the CushingQoL.

Results: Conventional outlier detections methods revealed no outliers reflecting extreme scores on the subscales of the CushingQoL. However, person fit statistics identified 18 patients with "atypical" response patterns, which would have been otherwise missed ($Zh > |\pm 2.00|$). Twelve of the patients with "atypical" responses tended to endorse the more extreme "always" or "never" responses and were deemed as "invalid responses." The other 6 patients tended to endorse the "sometimes" or "somewhat" responses and were deemed as "overfitting".

Conclusion: While the conventional methods of outlier detection indicated no outliers, person fit statistics identified several patients with "atypical" response patterns who otherwise appeared average. Person fit statistics allow healthcare providers to delve further into the underlying problems experienced by these "atypical" patients treated for Cushing's syndrome. Person fit statistics are an important tool for physicians and researchers when working with a

variety of patient groups. This method can also be extended to other types of health-related questionnaires.

LATENT GROWTH CURVE MODELS FOR BIOMARKERS OF THE STRESS RESPONSE

John Felt, MA, Sarah Depaoli, PhD., Jitske Tiemensma, PhD

University of California, Merced, Merced, CA

Objective: The stress response is a dynamic process that can be characterized by predictable biochemical and psychological changes. Biomarkers of the stress response are typically measured over time and require statistical methods that can model change over time. Through a search in the journal Health Psychology since 2000, the most commonly used methods to evaluate change over time in biomarkers were ANOVA and multilevel modeling approaches. Despite its flexibility, we identified no studies using latent growth curve models (LGCMs). Stress researchers may be unaware of how these methods can be useful. Therefore, our purpose is to provide an overview of LGCMs in the context of stress research.

Methods: The use of LGCMs are discussed in the context of the Trier Social Stress Test (TSST), a common laboratory acute stress paradigm. Results: The following four specifications of the LGCM are described: basic LGCM, LGCM for multiple groups (observed or unobserved), piecewise LGCM (PLGCM), and LGCM for two parallel processes. The basic LGCM is best suited for evaluating the rate of change over time. The LGCN for multiple groups can evaluate differences in growth trajectories for measured groups (e.g., gender, experimental groups) or unobserved groups (e.g., nonresponders vs. high responders). The piecewise LGCM is best suited for evaluating nonlinear change where the location of the bend (i.e., time-point where growth becomes nonlinear) in the growth trajectory line is known a priori. The LGCM for two parallel processes is best suited to model the relationships between two different simultaneous measures of the stress response.

Conclusions: The LGCM and the alternative specifications of the LGCM are a useful tool for stress researchers evaluating change over time of biomarkers such as cortisol or alpha-amylase. Ultimately, the choice of which statistical method to use will be determined by the research question and characteristics of the data. A link to example code of each specification of the LGCM will be provided on the poster.

MODEL (MIS)FIT IN A CONFIRMATORY FACTOR ANALYSIS OF THE RELIGIOUS ORIENTATION SCALE – REVISED

Cecilia Bess, M.A.[1], Andrew Littlefield, PhD[1], Jennifer L. Brown, Ph.D.[2], Amelia Talley, PhD[1]

[1]Texas Tech University, Lubbock, TX; [2]University of Cincinnati, Cincinnati, OH

The Religious Orientation Scale-Revised (ROS-R) was developed to assess religious motivation with two sub-scales (i.e., intrinsic – religion as an end, an individual who lives his/her life according to their religious beliefs; extrinsic – religion as a means to an end, an individual who uses religion to achieve personal non-religious goals). The ROS-R is a 14-item questionnaire derived from the 20-item original measure; the ROS-R's two-factor structure was originally tested, via confirmatory factor analysis, in a sample of students who attended secular and religious colleges. The ROS and ROS-R are the most commonly used measures when examining religious orientation in relation to health. Within the broader health literature, individuals who are intrinsically oriented are less likely to partake in unhealthy behaviors and experience fewer anxiety symptoms than those who are extrinsically oriented. The aim of the present study was to confirm the factor structure of the ROS-R in a large sample of college students (*N* = 810; 71.3% female, *M* age = 20.1, *SD* = 2.9). Confirmatory factor analysis evaluated the goodness of fit of the previously validated, two-factor structure. Comparative fit index (CFI), root-mean-square error of approximation (RMSEA), and weighted root mean square residual (WRMR) indicators of model fit were considered. Results indicated poor model fit for all models tested (e.g., significant χ^2 values; CFIs < .90, RMSEAs > .10; Hu & Bentler, 1999). Results suggest greater caution when health researchers consider using the suggested two-factor structure of the ROS-R. Future research should be conducted to further examine the factor structure and psychometrics of the ROS-R in diverse samples.

IMPLEMENTATION OF A TBI SCREENING CLINIC FOR OEF/OIF VETERANS

Jenna Gress Smith, PhD[1], MaryLu Bushnell, PsyD[2]

[1]Phoenix VA Medical Center, Gilbert, AZ; [2]Phoenix VA Medical Center, Phoenix, AZ

Approximately 6.7% (Taylor, 2011) of Operation Enduring Freedom/Operation Iraqi Freedom (OEF/OIF) Veterans are returning from deployment with traumatic brain injury (TBI), also known as the "signature injury" of this conflict. TBI can be associated with a host of neuropsychological deficits such as problems with attention, memory, and executive functioning. Although most individuals who sustain a mild TBI have full recovery within days to weeks post injury, a small proportion have cognitive deficits that extend beyond one year. Reports of cognitive complaints are often complicated by co-occurring mental health symptoms. The current study sought to understand the prevalence and relationships among TBI, post-traumatic stress disorder PTSD, and depression among OEF/OIF Veterans within the context of a neuropsychological screening evaluation which was conducted during the same appointment as the nationally mandated second level TBI evaluation. The purpose of the clinic was to improve access and quality of care by conducting brief (one hour) neuropsychological screening exams, the results of which were used to connect Veterans to the most appropriate level of care. The majority of the 138 participants was male (95%) and Caucasian (71%); 44% were married, 48% employed, and the number of deployments ranged from 1 to 14 (M=1.79 SD=1.40). On average, Veterans reported clinically significant levels of depression (Beck Depression Inventory-II; M=23.76, SD=13.34) and PTSD (PTSD Checklist, military version; M=51.74, SD=16.02) symptoms. Averages for neuropsychological subscales, as measured by the Neuropsychological Assessment Battery (NAB), were within normal limits (reported as standard scores between 85-115) for attention, memory, and executive functioning. Correlations were also examined; while PTSD symptoms were negatively correlated with all three subscales of the NAB, depression symptoms were only negatively correlated with memory (all *p's* < .05). After this brief assessment, 20% of veterans were referred for full neuropsychological batteries and 70% to mental health services. The results of this study highlight the potential benefits of a brief screening assessment to improve services, access, and provide psychoeducation to newly returned Veterans.

MIXED-EFFECTS MODEL ANALYSIS OF REDUNDANCY IN LONGITUDINAL ELECTRONIC HEALTH RECORDS

Jihoon Kim, MS[1], Hai Yang, MS[1], Kellie Avery, BS[2], Hyeon-Eui Kim, RN,PhD[1], Tania Zamora, BA[3], Zia Agha, MD[4], Lucila Ohno-Machado, MD,PhD[1]

[1]University of California, San Diego, La Jolla, CA; [2]VA San Diego Healthcare System, La Jolla, CA; [3]VA San Diego Healthcare System, San Diego, CA; [4]West Health, La Jolla, CA

Widely adopted copy-and-paste function in electronic health records (EHRs) system impacts negatively on patient care by introduction of errors, decreasing the efficiency in patient care due to redundant information in EHR, and imposing cognitive burden on physicians requiring unnecessary sifting through the clinical notes in a limited time during patient encounter. Previous studies on redundancy in EHRs have limitations. They only focused on the whole note even though nested sections have different redundancy or used only a small number of notes, no systematic regression approach was applied that can correctly capture covariance structure and multi-levels inherent in EHR redundancy data. We collected 950 clinical notes from 100 patients seen by 18 physicians over 31 time-points from Veterans Affairs (VA) San Diego hospital. Each note was tagged and split into sections of assessment plan, labs, medications, past medical history, physical exam, vital sign, and a whole note. Preprocessing was applied with natural language processing (NLP) that includes lower-casing, punctuation/comma removal, stop-word removal, and lexical normalization. A series is defined as a set of notes for a single patient in a chronological order. Within a series, the note created at the earliest time-point was deemed as a reference note, from which a distance to all other notes, within a series, was measured. Three distance functions are normalized Levenshtein edit distance, Needleman-Wunsch (NW) global alignment based distance, and Smith-Waterman (SW) local alignment based distance. A mixed-effects model was fit using DISTANCE as an outcome, PATIENT identifier as a group variable, TIME as a nested/correlated within a patient, and three covariates; document type (DOCTYPE), ALGORITHM for distance, preprocessing of either NLP-processed or not. Python 2.7 and Natural Lanuage Toolkit (NLTK) 3.0 were used for data management and R 3.3.1 was used for statistical analysis. Starting with the null model, each covariate was sequentially added if ANOVA test of a full model and a nested model was significant. The resulting random effects model retained 4 covariates, DOCTYPE, ALGORITHM, NLP, and TIME, all significant at p-value threshold 0.05. Profiling per-section trend of redundancy in an individual patient showed the marked difference of pattern for each section in reference to the whole note. For example, the past medical history section level pattern showed plateau pattern while the whole note level pattern fluctuated along the

time. Hence different sections contribute differently to the redundancy between two clinical notes. When the rank-based correlation was measured between distance algorithms, Levenshtein and NW showed high correlation ranging [0.87, 0.97]. Our study shows that section instead of a whole note is preferred unit of redundancy analysis, and demonstrates the usefulness of mixed-effects model.

ROBOTIC THERAPY IN A VA LONG TERM CARE FACILITY - EFFECTIVENESS DATA ON AN ITEM LEVEL

Geoffrey W. Lane, PhD / ABPP [1], Delilah Noronha, PsyD[2], Carolyn Resner, BA[3]

[1]VA Palo Alto Healthcare System - Livermore Division, Livermore, CA; [2]VA Palo Alto Healthcare System - San Jose Clinic, San Jose, CA; [3]Palo Alto University, Livermore, CA

Robotic technology has become increasingly widespread in its adoption and acceptance in mainstream society. One of the most recent developments in the clinical use of robotics is that of the socially assistive robot, with the most prominent and early entrant to this social robotics niche taking the form of a baby harp seal, dubbed 'Paro.'

Paro has been studied and used with a variety of populations, and most extensively, with older adults in residential and custodial care settings. Paro has been previously found effective in reducing depression, subjective loneliness, and improving cognitive function in older adults, and there has been evidence suggesting Paro is effective in reducing behavioral and psychological symptoms of dementia. Recently, the Department of Veterans Affairs has become interested in using social robotics with older adult long-term care veterans as a psychosocial intervention at their Community Living Centers (AKA, VA nursing homes).

The current proposal involves an item-level reanalysis of previously published data demonstrating the broad effectiveness of Paro in improving mood and behavior in residents at a specialty geropsychiatric CLC facility. Previous data has found that use of Paro tends to be more effective in improving observations of positive mood and prosocial behavior, rather than decreasing negative mood states and antisocial behaviors (e.g., both internalizing and externalizing in nature). It is thought that this is because introduction of a nonpharmacological intervention tool like Paro is effective for subjects who are not acutely distressed, and therefore are more receptive to introduction of a companion robot.

What is as yet unclear is for what specific kinds of behavioral and mood symptoms and states the introduction of Paro might be most or least effective for in veteran long-term-care residents. This kind of information could help to guide clinicians in helping to structure and target their introduction of such an intervention to patients and residents for whom they stand the best chance of success.

Results suggest that while the greatest magnitude of change in behavioral and mood descriptors observed by nursing staff was in positive mood and behavioral descriptors such as

“conversing,” and “bright affect,” there was evidence that Paro was effective in reducing nursing observations of negative states such as “anxiety” and even externalizing behaviors such as “wandering.” It should be noted that, in line with expectations, observations such as “pacing,” “yelling,” or “complaints of pain” were essentially flat.

Reasons for these findings will be briefly discussed, as well as clinical implications for veteran and non-veteran populations, and suggestions for further research.

SMOKING AND DRINKING BEHAVIORS OF MILITARY SPOUSES: FINDINGS FROM THE MILLENNIUM COHORT FAMILY STUDY

Daniel Trone, PhD[1], Teresa Powell, MS[2], Amber D. Seelig, MPH[3], Arthur V. Peterson, Jr., Ph.D.[4], Alyson J. Littman, PhD[5], Emily Williams, PhD, MPH[6], Charles Maynard, PhD[7], Jonathan Bricker, PHD [4], Edward J. Boyko, MD, MPH[8]

[1]Military Population Health Directorate / Naval Health Research Center, San Diego, CA; [2]Henry Jackson Foundation, San Diego, CA; [3]Seattle Epidemiologic Research and Information Center, Va Puget Sound Health Care System, Seattle, WA; [4]Fred Hutchinson Cancer Research Center, Seattle, WA; [5]VA Puget Sound Health Care System and the University of Washington, Seattle, WA; [6]VA Puget Sound Health Services Research & Development and University of Washington Department of Health Services, Seattle, WA; [7]Department of Veteans Affairs, Seattle, WA; [8]VA Puget Sound Health Care System, Seattle, WA

The association between stressful military experiences and tobacco use and alcohol misuse among service members is well-documented. However, little is known about whether stressful military experiences are associated with tobacco use and alcohol misuse among military spouses. Using 9872 service member-spouse dyads enrolled in the Millennium Cohort Family Study, we employed logistic regression to estimate the odds of self-reported cigarette smoking, risky drinking, and problem drinking among spouses by service member deployment status; communication regarding deployment; and stress associated with military-related experiences while adjusting for demography, mental health, military experiences, and service member military characteristics. Current cigarette smoking was reported by 17.2%, risky drinking by 36.3%, and problem drinking by 7.3% of military spouses. Current deployment was not found to be associated with spouse smoking or drinking behaviors. Communication about deployment experiences with spouses was associated with lower odds of smoking, but not with risky or problem drinking. Spouses bothered by communicated deployment experiences, and those who reported feeling very stressed by a combat-related deployment or duty assignment, had consistently higher odds of both risky and problem drinking. These results demonstrate how a deployment experienced by military spouses is associated with their smoking and alcohol misuse. A focus on deployment occurrence without consideration of a spouse's experience may miss important correlates of this exposure.

ASSOCIATIONS BETWEEN EXPERIENTIAL AVOIDANCE AND PSYCHOLOGICAL DISTRESS IN OVERWEIGHT AND OBESE INDIVIDUALS

Danielle Wischenka, MA

Yeshiva University, lawrence, NY

Background: Experiential avoidance (EA) is a pattern whereby individuals attempt to avoid experiencing physical sensation, thoughts and feelings. This avoidance pattern is theoretically related to exercise dependence, disordered eating, depression, anxiety, and stress; however, these relationships remains unclear in subclinical populations. Understanding the associations between these variables in groups such as pre-obese and obese individuals can help clinicians and researchers better individualize recommendations to reduce weight and effectively change behavior. Thus, the purpose of this study was to examine experiential avoidance strategies and other related variables in a sample of approximately 30% overweight and 32% obese individuals using BMI and body dissatisfaction as weight measures.

Method: Participants (N=1075; Mean Age = 42.05, SD = 15.37, 60% female) completed an online survey that included the Multidimensional Experiential Avoidance Questionnaire (MEAQ), Eating Aptitudes Test (EAT-26), and the Depression Anxiety Stress Scale (DASS-21). Correlation and regression analyses were used to identify associations between experiential avoidance, eating pathology, psychological distress variables and weight measures.

Results: BMI and body dissatisfaction were related to depression (r= .107, p< .001, N= 1068; r= .135, p< .001, N= 1067), anxiety (r= .121, p< .001, N= 1069; r= .122, p< .001, N= 1068), stress (r= .067, p= .027, N= 1068; r= .087, p= .005, N= 1067), and overall psychological distress (r= .103, p= .001, N= 1061; r= .124, p< .001, N= 1060) levels in the sample. Mean comparisons further indicated that overall psychological distress levels increased across BMI categories as participants' BMI increase. Further analyses indicate that individuals' psychological distress level was related to their levels of experiential avoidance (r= .454, p< .001, N= 1057). An inverse relationship between BMI and obligatory exercise was found (r= -.191, p< .001, N= 1057), indicating that individuals with higher BMI have less compulsive desire to engage in exercise. A multiple regression model with disordered eating pathology, overall experiential avoidance, and specific experiential avoidance strategies of procrastination, distraction and suppression, and behavioral avoidance as predictors of psychological distress: R^2= .305, F(5, 1056) = 92.59, p< .001 .

Discussion: Results suggest the associations among disordered eating pathology, psychological distress, and experiential avoidance require further research and understanding,

particularly in the treatment and care of overweight and obese individuals. This study may inform researchers and clinicians on ways to better assess and treat individuals with weight and eating difficulties, and further analyses are expected to explain the relationship between these theoretically related constructs.

EFFECTS OF BEHAVIORAL WEIGHT-LOSS TREATMENT ON SYMPTOMS OF FOOD ADDICTION IN ADULTS WITH OBESITY

Eliza L. Gordon, M.S., Vivian Bauman, B.S., Aviva H. Ariel-Donges, M.S., Kathryn Ross, PhD, MPh, Michael Perri, PhD, ABPP

University of Florida, Gainesville, FL

Introduction: Food “addiction” (FA) involves the compulsive consumption, despite adverse consequences, of highly palatable foods such as those high in sugar or fat. In this study, we examined the effect of behavioral weight-loss treatment on FA symptoms, and we explored potential correlates of decreases in FA symptoms, including weight loss and changes in the consumption of sweets and fruits.

Methods: The study sample included 127 adults (82.7% women, 83.5% Caucasian; M±SD; age = 55.6±10.4 years, BMI = 36.5± .5 kg/m^2) who completed a 4-month behavioral weight-loss program. The Yale FA Scale (YFAS), a 25-item self-report questionnaire using modified DSM-IV substance dependence criteria, was administered pre- and posttreatment. Consumption of sweets and fruits were measured by the Rapid Eating Assessment for Participants-Shortened Version (REAPS). Analyses were conducted using bootstrapped one-way ANOVAs and bootstrapped hierarchical regression.

Results: At baseline, participants endorsed a mean of 2.4 out of 7 FA symptoms, and 14.2% met the YFAS criteria for FA (^{3}3 symptoms coupled with distress/impairment). The intervention produced a mean weight loss of 8.7% initial body weight ($p < .001$). From pre- to posttreatment, the mean number of FA symptoms fell to 1.5 ($p < .001$) and the proportion of participants who met the YFAS diagnostic criteria decreased to 2.4% ($p = .001$). Reduction in FA symptoms was associated with reduced frequency of sweets consumption (B = -.446, $p = .011$) and increased fruit intake (B = -.408, $p = .005$), but weight change was not significantly related to FA symptom change (B = -.332, $p = .900$). The following blocks were entered in the hierarchical regression: 1) racial status, baseline BMI; 2) weight change; 3) change in sweets consumption, change in fruit intake. Racial status and baseline BMI explained a significant amount of the variability in FA symptom changes ($R^2 = .073$, $p = .009$); weight change did not contribute significantly (R^2 change = .012, $p = .201$), but changes in consumption of sweets and fruit explained a significant amount of variability beyond weight change (R^2 change = .112, $p < .001$).

Discussion: The findings in this study showed that participation in behavioral weight-loss treatment significantly decreased FA symptoms. However, the reduction in FA symptoms was not related to weight loss but was associated with increased intake of fruits and decreased consumption of sweets.

EVALUATING A TARGETED, UNIVERSAL MIDDLE SCHOOL PROGRAM FOR CHILDHOOD OVERWEIGHT AND OBESITY: STAYINGFIT

Myra Altman, MA[1], Jacqueline Hayes, MA[1], C. Barr Taylor, Ph.D.[2], Denise Wilfley, Ph.D.[1]

[1]Washington University in St. Louis, St. Louis, MO; [2]Palo Alto University/Stanford Medical School, Palo Alto, CA

Childhood obesity is a pressing public health concern associated with significant medical and psychosocial comorbidities. Intervention is crucial, and schools are often suggested as an optimal venue through which to intervene, although the results of such interventions are inconsistent and mixed. The present study sought to expand on the literature by evaluating the effectiveness of an evidence-based, online, targeted and universal school-based obesity intervention, *StayingFit,* in three middle schools in a rural community of low-socioeconomic status. The intervention was tested in both a cluster-randomized (Study 1, N=524) and pre-post (Study 2, N=307) design. *StayingFit* was feasible to implement and was generally liked by students and teachers, however, outcome results were limited and inconsistent between Study 1 and 2.In Study 1, the interventionresulted in decreases in fruit juice (B=-0.01, pStayingFit was ineffective in creating changes in relative weight, diet, physical activity, sleep, or psychosocial outcomes (all other *p*s>.05). Possible reasons for the limited effectiveness of the intervention include implementation challenges, the nature of the population and community, insufficient use of behavioral strategies and technology, limited program duration, low completion rates, and lack of parental engagement. This study contributes to the mixed findings in the school-based intervention literature, and highlights many of the challenges encountered when implementing interventions in high-risk communities. There is a pressing need for further research to design and test multi-level and multi-sector interventions that can create meaningful and necessary change in these communities.

FOOD SELECTION DURING BINGE EPISODES IN HISPANICS WITH BINGE EATING DISORDER

Abigail Alido, B.A.[1], Sylvia Herbozo, Ph.D.[2], Dean Lim, M.A.[3]

[1]Department of Psychology, Loma Linda University, Eastvale, CA; [2]Loma Linda University, Loma Linda, CA; [3]Department of Psychology, Loma Linda University, Rancho Cucamonga, CA

Binge eating disorder (BED) has been identified as the most prevalent eating disorder among Hispanics. This ethnic group has also shown high rates of obesity, a medical condition strongly associated with BED. Yet, few studies have examined the type of foods consumed during binge episodes and such studies have consisted of primarily Caucasian samples limiting the generalizability of the findings to other ethnic groups. Given that recent research has shown no ethnic differences in BED, studies investigating nutritional aspects of binge eating episodes among ethnic minorities, especially Hispanics who are obese, are needed. We examined the food selection during binge episodes for Hispanics with BED and obesity. Participants were 14 Hispanic adults aged 20 to 62 (M = 47.21, SD = 13.17) with a mean body mass index of 36.46 (SD = 6.34). Approximately 93% of the sample was born in the U.S. Participants were administered the Eating Disorder Examination in which they were asked to describe foods consumed during a binge episode. Two raters coded the binge episodes to identify which food pyramid categories (e.g. grains, fruits, vegetables, meats and beans) and food types (e.g. Bread/pasta/tortillas, potatoes, rice, sweet snacks, salty snacks, high-fat meat items) were consumed. The two raters reached 100% agreement after discussing the few coding discrepancies. The predominant food consumed during the binge episode was identified by food pyramid category as well as food type. Participants had an average of 3.22 binge episodes per week (SD = 2.69) for the past three months. Of the binge episodes, 85% contained high-fat meat items, 68% contained sweet snacks, and 64% contained breads/pastas/tortillas. For food pyramid categories, the most common predominant food consumed during a binge episode was meats and beans (64%) followed by grains (21%). Specifically, when examining type of food consumed during a binge episode, high-fat meat items were the most common predominant food (53%) followed by bread/pasta/tortillas (14%). Study findings indicate that high-fat meats and sweet snacks are common binge foods in Hispanics with BED and obesity which partially supports prior research with primarily Caucasian samples. Additional research is warranted to further determine food selection patterns during binge episodes in this ethnic minority group. Such research could provide valuable information that can be utilized to modify BED treatments for Hispanics.

OBESITY STIGMA: EFFORT, ANXIETY, AND COGNITIVE FUNCTIONING

Jacob M. Burmeister, PhD[1], Afton M. Koball, PhD, ABPP[2], Sarah Domoff, PhD[3], Robert Carels, Ph.D., MBA[4]

[1]University of Dayton, Dayton, OH; [2]Gundersen Health System, La Crosse, WI; [3]Central Michigan University, Mt. Pleasant, MI; [4]East Carolina University, Greenville, NC

Background: Health-related stigma is a fundamental yet understudied contributor to health problems. Among health conditions that are stigmatized, obesity ranks near the top. Negative effects of obesity stigma have been found in healthcare, education, employment, and interpersonal relationships. Health behaviors have been shown to be directly affected by experiences of stigma as demonstrated by several experiments in which acute stigmatization leads individuals to eat unhealthy foods and engage in less physical activity. Less is known about the mental processes that mediate these effects and how experiencing stigmatization might affect cognitive functioning. Two experiments explored these effects.

Methods & Results: Experiment 1 tested the hypothesis that being stigmatized for having obesity acutely affects overweight individuals' effort compared to normal weight participants and controls. In a laboratory setting, participants ($N = 97$) were randomly assigned 1 of 3 conditions. They received either mildly stigmatizing information about their weight status, strongly stigmatizing information about obesity stereotypes, or no stigmatizing information. The dependent variable of effort was measured by the amount of time participants spent attempting to solve very difficult anagram tasks. No between group differences were observed ($p > .05$). Experiment 2 was of similar design ($N = 155$), but with different dependent variables: implicit bias toward anxiety-related words and working memory. Deleterious effects were hypothesized for overweight individuals vs normal weight participants and controls. Implicit bias toward anxiety-related words was measured using a computerized dot probe task. Working memory was measured using a computerized operation span memory task. No between group differences were observed ($p > .05$).

Conclusions: In both experiments, participants who were overweight fared no worse in these realms than other participants after being stigmatized for their weight. All participants who were stigmatized performed as well as controls regardless of level of stigmatization. These findings suggest a limit exists to how badly individuals are affected by experiencing acute stigma. This evidence contradicts other studies that do show individuals suffer from acute stigmatization and a broad literature that suggests cumulative effects of stigma are

detrimental. It is possible that chronic stigmatization leads to problems not apparent in acute stigmatizing episodes. It may also be that health stigma only affects individuals in specific relevant behaviors as in stereotype threat phenomena.

UNDERSTANDING OF DYNAMIC INTERRELATIONS BETWEEN POSITIVE EMOTIONS AND CRAVINGS FOR UNHEALTHY SNACKS AND DRINKS

Bin Xie, PhD[1], Kim Reynolds, PhD[1], Anna Lee, MPH, MA[1], Zhongzheng Niu, MS, MD[1], Stacey Doan, PhD[2], Alan Stacy, PhD[1]

[1]Claremont Graduate University, Claremont, CA; [2]Claremont McKenna College, Claremont, CA

Background: Few efforts have been made to investigate dynamic interrelations between “positive emotions” and “cravings for unhealthy snacks and drinks” among adolescents. Ecological momentary assessment (EMA) has been recommended to acquire ecologically valid real-time information on snacking behaviors and related psychosocial factors. The time-varying effect model (TVEM) allows regression coefficients, which quantify behavioral associations, to vary over time and to be expressed dynamically and graphically, as smooth functions of time. This model therefore provides a novel approach for modeling dynamic interrelations. In this study we analyzed data from a longitudinal assessment of momentary ratings of four types of positive emotions and craving for unhealthy snacks and drinks among adolescents with the purpose of advancing understanding of their dynamic interrelations over time.

Methods: EMA data were collected during a 7-day period on handheld PDA devices among 158 adolescents aged 14 to 17 years. Time-varying measurements included momentary self-reported scores of positive emotions (i.e. feeling “relaxed”, “happy”, “energetic” and “cheerful”, scores ranging 0-100) and self-reported scores of three craving outcomes (i.e. craving for a “sweet snack”, a “salty snack” and a “sweetened drink”, scores ranging 0-100). Multilevel random-effect models and TVEM models were employed in the longitudinal analysis with adjustment for gender, ethnicity, age and obesity status.

Results: Results from the multilevel random-effect models revealed significant positive associations of positive emotion scores with scores of craving for a sweet snack (feeling relaxed: β=0.04, p=0.03; feeling happy: β=0.07, p=0.003; feeling energetic: β=0.10, p0.0001; feeling cheerful: β=0.08, p=0.001) and with scores of craving for a sweetened drink (feeling relaxed: β=0.08, p=0.0001; feeling happy: β=0.14, p

Conclusions: Our study demonstrated an initial effort to understand the process of time-varying interrelations between momentary assessments of positive emotions and craving for unhealthy snacks and drinks among adolescents. A better understanding of the underlying mechanisms for this dynamic process may help foster development of effective interventions.

USE OF A NOVEL TECHNOLOGY-BASED APPROACH TO HARNESS SOCIAL NETWORKS FOR WEIGHT LOSS IN ADULTS: PILOT RANDOMIZED CONTROLLED TRIAL

Courtney M. Monroe, PhD, EP-C, Chelsea Larsen, MPH, CHES, Delia S. West, PhD

University of South Carolina, Columbia, SC

Engaging social support and giving individuals tangible resources are methods that have been found to improve weight loss outcomes. This study examined the effect of leveraging existing social networks through the provision of advanced technologies for increasing weight losses over current best practices. Adults were randomized to a 16-week, evidence-based, standard behavioral weight loss treatment (SBT; n=18) or SBT plus social support resources for weight loss (Enhanced; n=18). Both groups received weekly, in-person group counseling sessions targeting dietary and physical activity (PA) behavior change, a Fitbit Zip PA tracker, digital body weight scale, and access to a study website. The Enhanced group also received additional Fitbit Zips and digital scales which they were asked to share with up to two people of their choice within their social circle. Repeated measures ANOVA was used to compare baseline and 16-week measured weight, social support for diet and PA (measured on a 5-point Likert scale with higher scores indicating greater support), and reported number of appropriate weight control practices. X^2analysis was used to measure the group difference in the proportion of participants who lost ≥5% of their initial weight. Participants averaged 45±8.9 years, had a BMI of 36.1±7.3 kg/m^2 and were 94% female and 39% African-American. Intent-to-treat analyses showed significant weight decreases (p < .001) in both SBT (-3.8±3.6 kg) and Enhanced (-4.6±5.1 kg), with no difference between groups (p=.56). The proportion losing ≥5% of initial weight was similar between groups (33% for SBT vs 50% for Enhanced, p=.31). In SBT and Enhanced, respectively, the increases (ps < .05) in social support from pre (3.0±0.6 and 3.3±0.4 for diet; 2.9±0.9 and 2.9±0.6 for PA) to post (3.4±0.7 and 3.6±0.6 for diet; 3.2±0.9 and 3.4±0.7 for PA) were not different (ps>.05). At 4 months, SBT reported using 14.9±3.0 appropriate weight control practices (out of 23) versus 13.9±3.7 for Enhanced, an increase from baseline (p < .001), with no between group difference (p=.60). Simply providing advanced technologies to participant-selected support partners did not enhance weight losses beyond current best practices. A similar but less minimalistic approach (e.g., providing resources and support partner guidance) may be more effective. Future research should continue to explore how to best capitalize on the joint influence of technologies and social support to increase weight losses in larger samples.

DETERMINANTS OF PYSCHOSOCIAL VARIABLES AND PHYSICAL ACTIVITY AMONG ADULTS WITH KNEE OA PAIN: A SYSTEMATIC REVIEW OF THE EVIDENCE

Erica Anderson, BS, Bridgett Rahim-Williams, MA, MPH, PhD

Bethune-Cookman University, Daytona Beach, FL

Background: Knee OA is a chronic degenerative disease affecting functional mobility and psychosocial variables. While it is recognized that psychosocial variables such as depression and anxiety are associated with individuals who have knee OA pain, no systematic literature review has focused on examining the effect physical activity has on these psychosocial variables. The aim of this systematic literature review was to determine whether physical activity has an effect on psychosocial factors such as depression and anxiety among adults with knee OA pain.

Methods: A literature search using PubMed, CINAHL, Research gate, Sage database, and references of retrieved articles was conducted. Studies published from 2006-2016(through September) using a predefined search criteria: women with knee OA, mention of an anxiety/depression scale, pain assessment, addressed the role of physical activity were reviewed.

Results: The search terms: Physical Activity, Knee OA yielded 5,621 studies. After adding key terms: Women, Anxiety and Depression, and Pain, 537 studies resulted. Of the 537 studies, 530 studies were excluded. The exclusion criteria included such studies: that did not mention an anxiety or depression scale, physical activity, knee OA was not specifically mentioned, pre/post-operative total knee replacement and somatic pain. Seven (7) studies were deemed appropriate for the present review and included a diverse population by race/ethnicity, age, sex/gender, geographic location and type of physical activity (Tai Chi, Yoga, Exergames, and Walking). Two studies only included women. One study included both men and women, and four studies did not mention sex/gender. Racial/ethnic diversity included African Americans, Hispanics, Asians and Caucasians.

Conclusion: Current published studies revealed a positive relationship between psychosocial variables, physical activity and knee OA pain. However, there is a dearth of literature investigating the effect of physical activity and psychosocial variables in this population.

EVALUATION OF INTEGRATIVE PAIN MANAGEMENT ON MOOD, TREATMENT ENGAGEMENT, AND TRADITIONAL MEDICAL VISITS IN VETERANS

Melody Mickens, Ph.D., Leah Farrell-Carnahan, Ph.D., Meghan Rooney, Psy.D., Jay Wiles, M.S., Jina Wang, Pharm.D.

Hunter Holmes McGuire VA Medical Center, Richmond, VA

Background: Innovative chronic pain management programs, such as the Veterans Integrative Pain (VIP) Center, are developing within Veterans Affairs' Medical Centers. This short-term outpatient program blends traditional medical, complementary, and alternative approaches. It emphasizes self-management training (e.g., cognitive behavioral therapy, mindfulness meditation, biofeedback, dietary change) supplemented with passive approaches (e.g., acupuncture) aiming to empower Veterans with non-pharmacologic options. At intake, Veterans select from 13 treatments and engage in multiple services. The program aims to improve Veterans' functional capacity, mood, anxiety, and quality of life. The current study is an exploratory analysis of these outcomes.

Methods: Participants were Veterans with chronic pain (*N*=38) who participated in the program for at least 3 months. Demographic characteristics, program engagement, and number of medical visits three months before and three months after intake were obtained via chart review. Measures of pain catastrophizing (PCS), pain interference (POQ), and mood/anxiety symptoms (BAI, PHQ-9) were obtained at intake. Descriptive statistics were performed to characterize all variables. T-tests were conducted to explore changes in number of medical visits before and during the program participation period.

Findings: Veterans were predominately African-American (58%) males (71%) with a mean age of 49 years (SD=15). On average, Veterans engaged in 3 services (SD=2; range = 0-7), predominately auricular acupuncture (68%), biofeedback (42%), full body acupuncture (39%), anti-inflammatory diet education (24%), and mindfulness meditation (21%). Veterans had 0-6 medical visits prior to program and this reduced to 0-3 visits post program. However, these differences were not statistically significant. At intake, they reported subclinical pain catastrophizing (M=26, SD=11), mild functional interference (M=91, SD=29), moderate depression (M=13, SD=6), and severe anxiety (M=19, SD=12). Veterans reporting higher anxiety were more likely to engage in auricular acupuncture, t(27) = 2.85, $p < .01$ and those reporting higher pain catastrophizing and anxiety were significantly more likely to engage in auricular acupuncture, t(23) = 3.42, $p < .05$ and qigong, t(23)=2.98, $p < .05$.

Conclusions: As anxiety and pain catastrophizing increased, engagement in integrative approaches did as well. The absence of a significant decrease in traditional medical office visits in conjunction with participation is not surprising given the medical-complexity of this sample. Future investigations should investigate this further and consider other variables including disease comorbidity and change in opioids use.

PATTERNS AND PREDICTORS OF PAIN FOLLOWING LUNG TRANSPLANTATION

Julia Farquhar, B.S., MD candidate[1], Patrick Smith, PhD[2], James Blumenthal, PhD[2]

[1]Duke University School of Medicine, Durham, NC; [2]Department of Psychiatry and Behavioral Sciences/Duke University Medical Center, Durham, NC

Introduction: Lung transplantation, not unlike other major surgeries, is associated with significant acute pain for most patients. However, variability in pain levels during hospitalization and predictors of pain levels following hospital discharge have not been systematically evaluated.

Methods: We conducted a retrospective study of a series of 167 patients (39% female; 88% Caucasian) transplanted at Duke University Hospital between January 2015 and September 2016. Patients' subjective ratings of pain intensity using a 0-10 Numeric Rating Scale (NRS) were obtained daily during patients' hospitalization and 2 months after hospital discharge. Demographic variables (age, gender, and ethnicity), native lung disease (e.g., cystic fibrosis, chronic obstructive pulmonary disease, interstitial lung disease), history of alcohol, narcotic, or cocaine abuse, psychiatric conditions, and chronic pain, and co-morbid medical conditions were examined as predictors of pain after transplant surgery.

Results: Of 167 patients who were transplanted, 150 were discharged (median length of stay = 13 days [IQR = 15 days]), 10 died, and 7 remained hospitalized. In a mixed-effects, multiple regression model, pain ratings decreased over time ($P < .001$) and were higher among patients undergoing bilateral lung transplant ($P =.012$). Among pre-transplant predictors, history of depression was predictive of higher pain levels and slower resolution of postoperative pain ($P=0.021$). Two months after discharge, 18% of patients continued to report pain and a third remained on narcotic pain medications. Cystic fibrosis patients reported higher levels of pain at follow-up compared to patients with other native lung diseases ($P=.006$).

Conclusion: Although acute pain resolved following surgery for most lung recipients, nearly one in five patients continued to experience persistent pain 2 months following hospital discharge. Patients with cystic fibrosis or a history of depression appear especially vulnerable to chronic pain and may require more intensive efforts to help them manage pain once discharged.

PREDICTING ABERRANT MEDICATION-RELATED BEHAVIOR IN ADOLESCENT CANDIDATES FOR OPIOID THERAPY: UPDATE ON SCREENER DEVELOPMENT

Kelly A. Manser, B.A.[1], Stacey McCaffrey, PhD[1], Kimberlee J. Trudeau, Ph.D.[1], Deirdre Logan, PhD [2], Jean C. Solodiuk, RN PhD[3], Ryan Black, PH.D.[1], Jennifer Harman, PhD[4], Kelly Smith, BA[5], Stephen Butler, PhD[6]

[1]Inflexxion, Inc., Waltham, MA; [2]Boston Children's Hospital, Boston, MA; [3]Boston Childrens Hospital, Boston, MA; [4]St. Jude Childen's Research Hospital, Memphis, TN; [5]Boston Children's Hospital, Waltham, MA; [6]Inflexxion, Inc, Waltham, MA

Pediatric providers have voiced a need for a screening tool to assess risk of aberrant medication-related behavior (AMRB) in adolescents who may receive opioid therapy for chronic pain. Having previously identified indicators of ongoing AMRB in this population (Trudeau et. al., 2016), we interviewed clinicians as well as current/former patients and caregivers (CFP) to identify observable predictors (“red flags”) that suggest elevated risk of future AMRB in adolescents with chronic pain.

Thirteen pediatric clinicians (“experts”) and 29 CFP completed semi-structured interviews. Experts discussed “red flags” they associate with future AMRB risk; CFP described their experiences and/or difficulties related to opioid therapy. AMRB-predictive statements were extracted from interviews, coded by content, and consolidated. Fifteen clinicians used group concept mapping to sort the final 101 statements into thematic “piles” and rated on a 5-point Likert scale how confident they were (1=Not at all, 5=Extremely) that each statement was predictive of AMRB.

Concept maps with 5-9 clusters were generated; results supported an 8-cluster model. Clusters were: 1) Daily functioning, M=2.53; 2) Resistance in treatment context, M=2.78; 3) Pre-existing illicit substance use, M=3.67; 4) Psychological distress, M=2.66; 5) Maladaptive family dynamics, M=2.78; 6) Concerning opioid-specific patient behaviors, M=4.05; 7) Behaviors causing concern re: opioid use at home, M=3.92; 8) Caregiver not engaging appropriately, M=3.33. Clusters 6 and 7 were each rated significantly higher (i.e., more likely to predict AMRB) when compared individually to each of the other six clusters (all t’s < 13.2, all p’s < .005). Statements derived from CFP interviews were rated significantly higher than those originating from experts, t(99)=2.09, p=.04.

This study extends our previous findings: providers see risky behavior specifically related to substance (in this case, opioid) use as highly correlated with AMRB in adolescent pain patients. The psychosocial issues represented in Clusters 1, 2, and 4 seem to be more sensitive than specific as AMRB predictors; some (e.g., amotivation, social isolation) may be a natural, expected reaction to pediatric chronic illness. Lastly, CFP willing to discuss opioid use may provide information that is especially predictive of AMRB. These findings continue to inform our development of a risk assessment tool; a conceptually-derived checklist is currently under expert review.

PRE-SURGICAL CORRELATES OF POST-SURGICAL PAIN ACCEPTANCE AMONG UTAH WORKER'S COMPENSATION PATIENTS UNDERGOING LUMBAR FUSION

M. Scott DeBerard, Ph.D.[1], Jessica Gundy Cuneo, Ph.D.[2], Cassie Dance, M.A.[1], Julie L. Murray, BA[1], Seth Seifert, M.A.[1], JoAnn Tschanz, Ph.D.[1]

[1]Utah State University, Logan, UT; [2]UC San Diego Health System, San Diego, CA

Lumbar fusion surgery is an increasingly prevalent and costly procedure in the U.S. Given outcomes following this surgery are quite variable, there is an effort to identify pre-surgical biopsychosocial variables that may predict lumbar fusion outcomes (e.g., litigation, depression, pre-surgical pain, and etc.). Pain acceptance is a more recently examined construct shown to correlate with multiple patient outcomes. Identifying pre-surgical predictors of pain acceptance is likely relevant for purposes of pre-surgical screening. The present study examines how pre-surgical demographic, health status, and compensation variables correlate with post-surgical measures of pain acceptance. Participants were 101 Utah workers' compensation patients (average age = 42.4 yrs., 75.2% male) who underwent lumbar fusion surgery from 1987-2007 and were at least two-years post-surgery at time of follow-up. A retrospective cohort design was utilized consisting of a review of pre-surgical records and a postsurgical telephone survey. Presurgical variables included: gender, age, educational level, smoking, BMI, prior history of depression, and litigation status. The outcome measure was the Chronic Pain Acceptance Questionnaire (CPAQ) that assessed patient willingness to experiences pain despite the associated negative cognitive and psychological consequences and to continue to engage valued life activities. This measure included a total summary scale as well as subscales of Pain Willingness (PW) and Activity Engagement (AE). Correlational analyses revealed that male gender, lower levels of education, active smoking, positive history of depression and presence of litigation were all statistically significant correlates of lower CPAQ total and subscale scores. Pre-surgical variables were used to predict CPAQ scores using regression analyses. Statistically significant amounts of variance were predicted in CPAQ Total (R^2 = 0.14), PW (R^2 = 0.17) and AE (R^2 = 0.12%) scales. The benefits of integrating pre-surgical predictors of pain acceptance into patient selection protocols are discussed.

PSYCHOMETRIC PROPERTIES OF THE MINDFUL ATTENTION AWARENESS SCALE (MAAS) IN A GREEK-CYPRIOT SAMPLE OF CHRONIC PAIN PATIENTS

Marianna Zacharia, M.Sc., Vasilis Vasileiou, M.A., Maria Karekla, Ph.D.

University of Cyprus, Nicosia, Nicosia, Cyprus

Mindfulness as a concept has received great interest from the therapeutic community, especially in the area of chronic pain alleviation. However, well validated measures to assess changes in mindfulness especially in the Greek language are lacking. The purpose of this paper is to examine the factor structure and psychometric properties of the Mindful Attention Awareness Scale (MAAS) in Greek-Cypriot chronic pain patients. The sample (N = 133) was derived mainly from the Antirheumatoid Association of Cyprus and from various other health care centers. The forward-backward translation method was applied. Initially, and following the reported structure of the original English version, all 15 items were forced to a single-factor solution using exploratory factor analysis (EFA), which explained 32% of the total variance. EFA was then conducted without forcing factor extraction to investigate the existence of other factors explaining a larger percentage of the variance. Results supported a four-factor solution based on Kaiser's criterion, explaining 59.50% of the total variance. This finding was inconsistent with the sudden change on the scree plot chart emerging after the first factor. The clustering of items into the four factors does not appear to make sense conceptually. Parallel analysis was also performed, which corroborated the ambiguity of the scree plot, suggesting either two-factor or three-factor solutions. Therefore, items were forced into two-factor and three-factor solutions using EFA. Results indicated that the difference between the eigenvalues of the first factor and subsequent factors was large, with subsequent factors either showing negative or weak loadings and being comprised of a small number of items. Thus, consistent with previous empirical studies, a single-factor solution appears to be most suitable. G-MAAS exhibited good internal consistency (Cronbach's α = .83). G-MAAS showed relevant convergent validity with CAMS-R, a mindfulness measure and theoretically coherent significant negative correlations (discriminant validity) with measures of anxiety (HADS-anxiety), distress and non-acceptance (AAQ-II). G-MAAS appears to be a valid and reliable measure for assessing mindfulness in Greek-speaking chronic pain patients. The dimensionality of the G-MAAS, directions for future research and clinical implications are discussed.

AN IN-HOME VIRTUAL COACHING PROGRAM TO PROMOTE PHYSICAL ACTIVITY IN DIVERSE POPULATIONS: USER TESTING AND ACCEPTABILITY

Aldo Chazaro, BS[1], Sandra Jane. Winter, PhD, MHA[2], Vincent ChangChien, M.S.[3], Bo Yu Hou, M.S.[4], Abby C. King, PhD[1]

[1]Stanford School of Medicine, Palo Alto, CA; [2]Stanford University School of Medicine, Palo Alto, CA; [3]Stanford University School of Medicine, Chutung, Hsinchu, Taiwan (Republic of China); [4]Industrial Technology Research Institude, Chutung, Hsinchu, Taiwan (Republic of China)

Background: Physical inactivity due to lack of access to gyms, personal trainers, fitness programs and other physical activity (PA) resources can lead to increased risk of chronic disease. To address this, researchers at Stanford University worked with a team from the Industrial Technology Research Institute of Taiwan (ITRI) to test a virtual PA coaching program (vCoach), with the aim of encouraging people to engage in PA in the comfort of their own homes. The purpose of this pilot was to learn if this type of technology is acceptable to US residents.

Setting: vCoach testing was conducted in an exercise laboratory at Stanford. The vCoach system, located in a device roughly the size of a cable box, was connected to a tabletop 40” HD TV, that was used to display exercise modules provided by ITRI to participants. A camera sensor and wearable smart watch were utilized to display information to participants on the TV screen, such as calories burned, heart-rate, and similarity rating of participant’s exercise movements to the v-coach model.

Method: Individuals, recruited via online ads, completed the PAR-Q to ensure that they could safely perform PA. Participants were categorized according to self-reported PA of either low, medium or high intensity. One-time testing was conducted at the exercise lab by trained staff and lasted 1-2 hours. All participants did warm up and cool down exercises and activity modules matched to their self-reported intensity levels. On completion, all participants provided feedback on the modules and vCoach software.

Results: Participants (n=15, mean age=44) included 7 women and 7 Latinos. 93% rated their health as good or better. They reported their usual PA as low (n=6), medium (4), or high (5). 93% reported that the vCoach was appropriate for them, and 93% said they would use it if they had access. 66% reported they preferred seeing a human coach rather than an avatar

coach, and 80% had no preference for gender, age, or ethnicity of the coach. Reported barriers to using the software included technical issues, lack of efficacy in using technology more generally, and a preference for increased visual and audio instruction.

Conclusion: While almost all participants expressed a strong interest and desire to use the vCoach system, some participants reported technical barriers and lack of ease of use as potential deterrents to using the software at home. Next steps include incorporating the feedback to enhance the system and further in-home user testing.

ASSOCIATION OF SEDENTARY BEHAVIOR WITH SALIVARY ESTRADIOL LEVEL AMONG AFRICAN-AMERICAN WOMEN WHO ARE OVERWEIGHT

Md Abdullah Mamun, MS[1], Heather Kitzman-Ulrich, PhD[2], Leilani Dodgen, MPH[1], Surendra Reddy Mandapati, BDS[1], Kisa Gant, BS[1], Ike Eke, BA[3]

[1]University of North Texas Health Science Center, Fort Worth, TX; [2]Baylor Scott & White Health, Dallas, TX; [3]University of North Texas Health Science Center, fort Worth, TX

Objective

Recent studies have reported that sedentary behavior may have multiple adverse health outcomes in adults, and is related to elevated levels of estradiol that are associated with breast cancer, ovarian cancer, and endometrial cancer. A growing body of research has assessed the association of sedentary behavior with estradiol levels, however few studies have been in African-American (AA) overweight women who are disproportionally diagnosed with cancer. The objective of this study was to assess the association of self-reported sedentary behavior of AA overweight women with salivary estradiol level.

Method

We recruited 263 AA overweight (BMI$\geq$25, mean BMI 36.8 (SD 8.5), mean age 49.4 (SD 11.6) years) women from a faith-based weight reduction program from 2014-2016 in Dallas, Texas. Approximately 4mL of saliva was collected over four consecutive weeks. Saliva was stored in a sub 80^0C freezer and sent to a lab to assay. Weekly sedentary behavior was collected with a valid and reliable survey for weekdays and weekends that included hours of sitting to watch television, working on the computer, riding in a car, bus, or train, and other sitting practices. We used Pearson's-correlation and linear models to estimate the unadjusted and adjusted association of sedentary behavior with estradiol level.

Results

Average weekly sedentary time was 40.6 hours (SD = 17.5). The range of estradiol level was 0.50 pg/mL to 3.50 pg/mL with mean 1.13 pg/mL (SD = 0.55). Sedentary time was positively associated with estradiol level (correlation coefficient = 0.18, $p < 0.01$). After adjusting for age, BMI, and menstrual status, we found a significant positive association between sedentary time and estradiol level ($R^2 = 8.4\%$, $p < 0.01$).

Conclusion

Self-reported sedentary hours for AA overweight women were less than the national average (5.8 hours vs. 7.7 hours per day). We found that sedentary time was a predictive factor for estradiol level, and higher sedentary time was associated with elevated estradiol levels. Future research should further explore how sedentary behavior and elevated estradiol levels influence cancer risk in AA women.

CITATION AND MERITORIOUS AWARD WINNER

ASSOCIATIONS BETWEEN SEDENTARY AND STANDING BEHAVIORS WITH COGNITIVE FUNCTION AMONG BREAST CANCER SURVIVORS.

Sandahl H. Nelson, MS[1], Catherine R. Marinac, PhD[2], Lisa Cadmus-Bertram, PhD[3], Jacqueline Kerr, PhD, MSc[4], Loki Natarajan, PhD[4], Suneeta Godbole, MPH[4], Sheri J. Hartman, PhD[4]

[1]University of San Diego, California, La Jolla, CA; [2]Harvard TH Chan School of Public Health, Dana-Farber Cancer Institute, Boston, MA; [3]Department of Kinesiology University of Wisconsin, Madison, WI; [4]Department of Family Medicine and Public Health, UC San Diego, La Jolla, CA, USA, La Jolla, CA

Introduction: Many breast cancer survivors experience problems with cognitive functioning following cancer treatment. Based on research in older adults, a potential risk factor for cognitive impairments is time spent in sedentary behaviors. Since breast cancer survivors spend the majority of their day sedentary it is an important risk factor to assess. This pilot study examined associations between objectively measured sedentary behaviors and neuropsychological testing in breast cancer survivors (n=30).

Methods: For 7 days participants wore a hip accelerometer to measure total sedentary time and time in long sedentary bouts (≥20min) and a thigh inclinometer to measure sit-to-stand transitions and total standing time. Cognitive functioning was measured with the NIH Toolbox, which provided a composite score of fluid cognitive abilities and 5 domain scores (executive functioning, visual episodic memory, auditory episodic memory, working memory, and processing speed), all adjusted for age. Partially adjusted linear regression models controlled for measurement device wear time only, and fully adjusted models controlled for measurement device wear time plus education, employment status, and moderate to vigorous physical activity. There were no meaningful differences between the 2 models; therefore, the fully adjusted models are presented.

Results: Participants (n=30) were, on average 62 years of age (SD=8) and 2.6 years post-diagnosis (SD=1.1); 17 (56%) received chemotherapy. Visual episodic memory was positively associated with time (min/day) in sedentary bouts (b=0.11, p=0.004), indicating that each 30 min/day increase in sedentary bouts was associated with a 3.3-point increase on the visual episodic memory test. Processing speed was also positively associated with total standing time (b=0.09, p=0.031), indicating that each 30 min per day increase in standing time is

associated with a 2.7 point increase on the processing speed test. Executive function, working memory, and auditory episodic memory were not significantly associated with sedentary behaviors.

Conclusion: Longer standing time and greater time in sedentary bouts were positively associated with episodic memory and processing speed in breast cancer survivors, with or without controlling for education, employment status, and physical activity. Given the counterintuitive positive association between sedentary time and cognition future studies should examine what a person is doing while sedentary to aid in understanding this positive association.

CAN AN EXERCISE PRESCRIPTION PROGRAM BE IMPLEMENTED IN FAITH BASED SETTINGS?

Corliss Solomon, MPH[1], Jessica Montana, MPH[2], Marcella Beam, BS[2], Elizabeth Racine, PhD, RD[1], Greg Stewart, BS[2], Jennifer West, MPH[2]

[1]University of North Carolina at Charlotte, Charlotte, NC; [2]Cabarrus Health Alliance, Kannapolis, NC

Background: Improved opportunities for chronic disease prevention, risk reduction or management through community linkages have long been a public health priority, especially in relation to decreasing health disparities. One such strategy is increasing physical activity through exercise prescriptions and community referrals.

Objective: The main objective of exercise prescription programs are to nudge healthcare workers to include physical activity when developing treatment plans and referring patients to beneficial and nearby exercise programming. Traditionally, exercise prescription programs have been implemented in clinical settings, but this study explores the feasibility and effectiveness of an exercise prescription program in faith based settings with Faith Community Nurses (FCNs).

Methods: The exercise prescription program was implemented and evaluated in churches from January to December 2016 in a North Carolina county. Churches were eligible if they had a FCN and a predominately African American and/or Hispanic population. As a part of this exercise prescription program, the nurses provided exercise prescriptions as a part of their clinical encounters with church congregants. Additionally, referrals were given to local community resources to help patients “fill” their exercise prescription. Prescription data was collected in May with a 3 month follow up in September. Additionally, the public health effects of this exercise prescription program was assessed using the RE-AIM (Reach, Effectiveness, Adoption, Implementation and Maintenance) framework of program evaluation.

Results: Four Faith Community Nurses at four churches with predominately Black and Hispanic populations were trained and implemented exercise prescription programs within their congregations. Of those patients who received exercise prescriptions (n=72), 93% were overweight or obese, 75% had prehypertension or hypertension and more than half exercised moderately or vigorously 2 days/week or less. The average age of participants was 60 with the youngest participant being 21 and the oldest being 90. While there were no significant clinical changes in weight and blood pressure, the participants’ physical activity levels improved.

Conclusions and Implications: While exercise prescription programs are found to be feasible, it was not significantly effective on the health of participants and showed modest improvement in the physical activity of participants. This may be partly due to an older sample that have an assortment of health issues and significant barriers to physical activity. Thus, there are challenges in capturing clinical success. Additional research is needed and should include a larger and younger sample to explore exercise prescription programs feasibility and effectiveness in faith settings.

SELF-COMPASSION AND MOTIVATION FOR EXERCISE

Mandrila Das, B.A.

Texas Tech University, Lubbock, TX

Background: In a previous study, which was accepted for a paper presentation at SBM (Self-Compassion and Mindfulness: Examining the Relationship with Disordered Eating, Appearance-Motivated Exercise, and Depression Among College Students), researchers found that self-compassion negatively predicted appearance-motivated exercise. Given this novel and significant finding, researchers ran a post hoc analysis to understand how self-compassion may predict other motivations for exercise in addition to appearance-motivated exercise.

Recent research has focused on compulsive exercise to influence body weight or shape (Greenleaf, Petrie, Carter, & Reel, 2009). While exercise has typically been associated with positive mental health outcomes (Stephens, 1988), this relationship may differ if one engages in disordered eating behavior. For example, in a study with college students, exercise was related to positive mental health outcomes for individuals who did not engage in disordered eating, but negative outcomes for those who did engage in disordered eating (De Young & Anderson, 2010). One explanation for this discrepancy may be embedded in the motivation for exercise. Past research suggests that individuals who engage in exercise for appearance management reasons may be more likely to develop eating pathology than individuals who exercise for more health and fitness oriented reasons (La Page & Crowther, 2010).

Participants were 732 college students, both male (46%) and female (54%), ages 18-25 (*M*=19). Regression analysis was conducted to test main effects of self-compassion on motivation for exercise.

Results: Self-compassion was a significant positive predictor of exercising for more positive health-related reasons including to improve strength, to improve endurance, to increase resistance to disease and illness, to maintain physical well-being, and to have fun. However, self-compassion was a significant negative predictor of exercising to change one's body, appear attractive to the opposite sex, to be sexually desirable, to cope with sadness, and to cope with anxiety,

Conclusion: Self-compassion may increase the desire to engage in self-nourishing behaviors and decrease the desire to exercise for externally validating reasons (i.e. to be sexually desirable). One possible explanation, which builds on previous research, is that self-compassion promotes a healthier relationship with one's body, which in turn may lead

individuals to engage in exercise for more internal, physical health related reasons. While research on self-compassion in the exercise domain is fairly limited, this study provides initial support for further research in this area.

THE ROLE OF EXERCISE AND SELF-ESTEEM ON BODY SELF PERCEPTION

Elisabeth O'Rourke, B.S.[1], Renata Vaysman, PhD[2], Leslie Halpern, PhD[1]

[1]University at Albany, SUNY, Albany, NY; [2]New York Police Department, Brooklyn, NY

Introduction. Research has shown that low self-esteem is related to poor body image; however, whether exercise plays a role in this relationship is unclear. This study extends the literature by examining the moderating effect of exercise on the relation between self-esteem and body image. We hypothesized that self-esteem and BMI would be related to body image in both males and females. Moreover, we expected that after controlling for BMI, exercise frequency would moderate the relation between self-esteem and body image such that increased exercise frequency would be related to better body image as self-esteem increased.

Method. The participants were 201 undergraduates, [*M*(age)= 19.11, *N*(males)= 123]. Participants completed the body areas satisfaction subscale (BAS) of the Multidimensional Body Self Relations Questionnaire (MBSRQ; Brown, Cash, & Mikulka, 1990) and reported on self-esteem using the Rosenberg Self-Esteem Scale (Rosenberg, 1989). BMI was calculated based on self-reported height and weight, and participants reported the frequency of vigorous to moderate exercise they engaged in during an average week.

Results. T-tests revealed significant sex differences on several measures. Males (*M*=3.55, *SD*=.75) reported greater BAS than females (*M*=3.32, *SD*=.66, respectively) and higher self-esteem than females (*M*=32.39, *SD*=5.43; *M*=30.88, *SD*=5.15, respectively). Males (*M*=11.52, *SD*=4.41) also reported engaging in physical activity more frequently than females (*M*=9.67, *SD*=3.98). BMI was negatively correlated with BAS in males only (r(123)=-.27, $p < .01$). For males and females, BAS was positively correlated with self-esteem (r(123)=.55, $p < .01$; r(75)=.42, $p < .01$, respectively). Frequency of physical activity was not significantly correlated with any of the variables.

Hierarchical multiple regression analyses were used to examine the moderating effect of exercise on the relation between self-esteem and body image in men and women. BMI was included as a covariate on the first step of each regression. Both regressions were significant ($p < .05$). Self-esteem and exercise frequency accounted for a significant amount of variance in body image for both males and females ($R^2\Delta = .322$, $F(1, 121) = 31.76$, $p < .01$; $R^2\Delta = .223$, $F(1, 73) = 21.55$, $p < .01$, respectively). In the final step, the interaction term was significant only for males: $R^2\Delta = .025$, $F(1, 119) = 5.14$, $p < .05$. Examination of the interaction plot showed that as self-esteem increases, BAS increases for individuals who exercise more.

Discussion. For both males and females, greater overall self-esteem relates to positive body image, however, a moderating effect was found for exercise in males. The results indicate that for males, exercise can enhance how they positively perceive and evaluate their bodies. Research shows that having a positive body image has a significant positive impact on psychological well-being and willingness to participate in certain health behviors. Therefore these findings have widespread implications for intervention and research in behavioral medicine and mental health. Why exercise did not show a moderating effect for females requires further investigation.

THE SELF-EFFICACY FOR PHYSICAL ACTIVITY SCALE: VALIDITY AND PSYCHOMETRICS AMONG A SAMPLE OF LATINA WOMEN

Andrea Mendoza-Vasconez, MPH[1], Bess H. Marcus, Ph.D.[2]

[1]UC San Diego/San Diego State University, San Diego, CA; [2]University of California, San Diego, La Jolla, CA

Even though Latinos have become a priority population for the promotion of physical activity (PA), several of the most widely used scales in PA promotion research have not been validated among this population. The objective of this study is to assess the validity and other psychometrics of the Self Efficacy for Physical Activity (SEPA) scale among a sample of Latino women who participated in the Pasos Hacia La Salud study. Data from 205 women were analyzed. Item Response Theory (IRT) methods were used to model response options for the SEPA scale. Internal consistency (Cronbach's alpha) and unidimensionality (factor analysis) were assessed for the original and a modified version of the scale, both with baseline and 6-month data. Concurrent and predictive validity of the original and modified SEPA scales were assessed against accelerometer-measured moderate to vigorous PA (MVPA), using correlations and linear regressions. Based on plots of Option Characteristic Curves (OCC), a modified version of the SEPA scale was created by collapsing the five response options into three. Internal consistency for this modified scale remained acceptable (.71 - .76), and factor loadings improved compared to the original scale (.54 - .81 compared to .40 - .86). Self-efficacy at 6-months, measured with both the original and modified scales, was significantly correlated with MVPA at 6 months ($r=.30$ and $r=.32$, respectively, $p < 0.001$). However, self-efficacy at baseline was not correlated with MVPA at baseline, possibly due to the narrow range and restricted values of baseline MVPA. There were no significant effects of baseline self-efficacy (measured with the original and modified scales) on MVPA at 6 months. In conclusion, this study confirmed the SEPA scale's reliability and unidimensionality, and revealed that the scale's accuracy improves when response items are collapsed, which is an important finding for future research among populations with low literacy levels. Additionally, the study provided some evidence of concurrent validity of the SEPA scale against MVPA, but no evidence of predictive validity, possibly due to the long period of time elapsed between baseline and follow-up measurements. Thus, further research to validate the SEPA scale among this population is warranted.

MONEY MATTERS: FINANCIAL STRESS AMONG YOUNGER ADULTS WITH CANCER

Sugandha Gupta, BS[1], Amanda Marin-Chollom, MA[2], Tracey A. Revenson, PhD[3]

[1]The Graduate Center, City University of New York, New York, NY; [2]Columbia University Medical Center Mailman School of Public Health & The Graduate Center, City University of New York, New York, NY; [3]Hunter College, New York, NY

Background: Younger adult survivors, like all cancer survivors, face life stressors that are a result the illness and its treatment, but they also face specific concerns that emerge because their illness is off-time in the normative life cycle. Little research has examined how these specific stressors affect quality of life for younger survivors.

Aim: This mixed-methods study identifies the unique types of financial stress experienced by younger survivors and examines the relationship between financial stress and psychological distress.

Methods: Sixty hematological cancer survivors aged 20-49, 65% female, diagnosed within the past 5 years, were interviewed about the age-related challenges of their cancer diagnosis. Transcripts were coded for four types of financial stressors: financial burden on family; issues with health insurance; spillover to other life domains, such as plans for employment and education; and emotional sequelae. Participants also completed a self-report measure of depressive symptoms (CESD; Radloff, 1977).

Results: Although not directly asked about their financial situation, over 2/3 of the sample described at least one type of financial stressor during the interview. In 70% of the cases, these financial stains were directly linked to the survivor's life stage, including not finishing school, becoming unemployed, or envisioning an uncertain financial future. Interesting, those who mentioned financial consequences had lower education ($p < 0.04$) and tended to be in the 30s and 40s vs. 20s ($p < .10$). Half of the sample raised issues with health insurance (52.5%), including the strains of no insurance or inadequate coverage. Nearly half the sample (45%) described their financial strains as creating a burden on family and friends, often a result of having to move back home or take a loan, which created feelings of inadequacy and threats to independence. Over half the sample (55%) met the criterion for clinical depression (CESD score > 16) although depressive symptoms were unrelated to reporting any type of financial stress. Surprisingly, some younger survivors construed benefits in the way their financial status affected their lives.

Conclusions: Financial strains are clearly a concern for younger adult cancer patients, often related to “interruptions” in school and work responsibilities as well creating constraints on dating and friendships. These are concerns that should be discussed in counseling or peer forums for young adult survivors.

THE ASSOCIAION BETWEEN FAMILY SES AND CHILDREN'S HEALTH-RELATED QUALITY OF LIFE: THE ROLE OF OBJECTIVE AND SUBJECTIVE SES

Kay Kim, B.A.[1], Jan Wallander, PhD[2]

[1]University of California, Merced, Merced, CA; [2]Univ. California, Merced, Los Gatos, CA

Objective: To our knowledge, no study has compared the relationships that objective social status (OSS) and subjective social status (SSS) have with children's general health and health-related quality of life (HRQOL) across racial/ethnic groups. The present study tested the hypotheses that (a) OSS and SSS each have unique associations but (b) SSS mediates a portion of the association that OSS has with children's health outcomes; and (c) these associations are present across Black, Latino, and White children.

Method: Data were from the Healthy Passages^{TM} study, which enrolled 4,824 Black, Latino, and White 5th graders (ages 10-11) in three U.S. metropolitan areas. OSS was measured as a latent variable of parent reported educational attainment and total household income. SSS was measured also a latent variable of community and U.S. standing on the MacArthur Scale of Subjective Social Status. HRQOL was measured with the self-reported form of the PedsQL Physical and Psychosocial scales. Child's health status was measured by both child's self-report and parent's report of his or her health status on 5-point scale from *Poor* to *Excellent*.

Results: Structural equation modeling of path analysis was conducted using Mplus version 7. OSS had a stronger relationship to children's health outcomes compared to SSS. Because SSS did not have significant associations with the outcomes, there was little support for SSS mediating between OSS and health outcomes. The results of path analysis significantly differed across race/ethnicity, and only Black children's health status, when self-reported, was mediated by SSS.

Conclusion: Unlike emerging research on adults that SSS influences their health, the current study showed that parents' SSS did not play the same role for children's health. Rather, OSS was confirmed to have a stronger association with children's health status. Research is needed into the role of SSS for children's health, for example how and at what age children's *own* perception of socioeconomic status influences their health.

ETHNIC DIFFERENCES IN EARLY FAMILY ADVERSITY AND HPA AXIS FUNCTIONING AMONG LATINO AND EUROPEAN AMERICAN ADOLESCENTS

Ahra C. Ko, BA[1], Jessica Chiang, PhD[2], Julienne Bower, PhD[3], Shelley Taylor, PhD[4], Andrew Fuligni, PhD[3]

[1]University of Southern California, Los Angeles, CA; [2]Northwestern University, Evanston, IL; [3]UCLA Departments of Psychology and Psychiatry/Biobehavioral Sciences; Cousins Center for Psychoneuroimmunology, Los Angeles, CA; [4]Department of Psychology, UCLA, Los Angeles, CA

Previous research indicates that early family adversity can lead to blunted responding of the hypothalamic-pituitary-adrenal (HPA) axis (i.e., primary biological stress response system), thereby increasing risk for poor health outcomes such as cardiovascular disease, anxiety, and depression. Latinos are known to strongly value familism and collectivism whereas European Americans promote independence. Thus, the enduring consequences of early family adversity may be different between the two ethnic groups. However, the role of ethnicity and culture has often been neglected in past studies. Furthermore, examination of adolescents has been relatively rare, despite the fact that numerous biological and psychosocial changes occur during the adolescent period. The current study investigated whether the association between early family adversity and HPA response (i.e., cortisol production) differ between Latino- and European-American late adolescents.

Participants (N = 91; M_{age} = 18.37 years, SD = .51; 57.14% female; 37.36% European and 62.64% Latino) completed the Risky Families Questionnaire (Taylor et al., 2006) and participated in the Trier Social Stress Task (TSST), a widely used laboratory-based stressor that activates the HPA axis. Six saliva samples were collected (baseline, and 0, 30, 45, 60, 75, and 90 minutes post-TSST) and assayed for cortisol. Total area of the curve with respect to ground was computed to index total cortisol output (Pruessner et al., 2003).

Hierarchical regression analyses controlling for age, gender, and parental education revealed that early family adversity was unrelated to cortisol output. However, a significant interaction between early family adversity ethnicity emerged (*b(SE)* = -.62.29 (17.28), p = .001). Tests of simple slopes indicated that early family adversity was associated with blunted cortisol output among Latinos (*b(SE)* = -.33.82 (7.53), p < .001) but not among European-Americans (*b(SE)* = 28.47 (15.56), p = .07). Results suggest that the impact of early family adversity on HPA axis functioning may be more pronounced in Latinos compared to European-Americans, which may be due to their culturally rooted values of familism. This study highlights the importance of considering the role of ethnicity and culture when examining the effects of family-related adversity.

THE IMPACT OF HEALTHCARE DISCRIMINATION ON BELIEFS ABOUT HEALTH PROFESSIONALS AND CANCER SCREENING EMOTIONS

Daniel B. Betancourt, B.S. candidate[1], Patricia M. Flynn, Ph.D., M.P.H.[2]

[1]La Sierra University, Riverside, CA; [2]Loma Linda University, Loma Linda, CA

Ethnic minorities and lower socioeconomic status (SES) populations report more negative healthcare encounters and perceived discrimination. The aim of this research was to study the role of perceived healthcare discrimination as an antecedent of patients' negative beliefs about health professionals. These beliefs about health professionals have been associated with emotional reactions to clinical encounters that negatively impact continuity of cancer screening care (Betancourt, et al., 2011). It is proposed that negative beliefs about health professionals are the result of prior experiences of healthcare discrimination, which are expected to be associated with cancer screening emotions such as fear and anxiety about future clinical breast exams (CBE).

Participants were 171 Anglo American (Anglo) and 164 Latino American (Latino) women of varying SES levels from Southern California. They responded to a series of scales on perceived experiences of healthcare discrimination, negative beliefs about health professionals, and cancer screening emotions. Of the 335 participants, 73% of Anglo and 79% of Latino women reported prior experiences of healthcare discrimination, mainly based on insurance, SES, and ethnicity. Scores on negative beliefs about health professionals were higher for participants who experienced discrimination than those who did not (Latino: t = 3.86, p = .00; Anglo: t = 3.78, p = .00). In addition, compared to participants that did not report a prior experience of healthcare discrimination, those that did had higher levels of fear (Latino: t = 3.20, p = .00; Anglo: t = 3.01, p = .00) and anxiety (Latino: t = 2.60, p = .01; Anglo: t = 2.07, p = .04) in anticipation of a CBE.

Results are discussed in terms of implications for addressing health disparities and the translation of research into practice. This research demonstrates that prior experiences of healthcare discrimination elicit negative beliefs about health professionals and negative emotions associated with cancer screening, which according to previous research impact discontinuity of cancer screening care (Betancourt et al., 2011; Flynn et al., 2011). Training health professionals to use evidence-based bias reduction strategies to prevent the negative implications of their own biases about ethnic minorities and low SES patients could contribute to more positive clinical encounters and reduce perceptions of discrimination on the part of

patients. This, in turn, may improve cancer screening emotions and screening rates overall, but particularly among ethnic minorities and low SES groups.

THE ROLE OF ACCULTURATION AND STRESS IN RISK FOR OBESITY IN PREGNANT MEXICAN AMERICAN WOMEN

Amiel Maldonado, Student, Kimberly D'Anna-Hernandez, PhD, Paola Ilescas, Student

CSU San Marcos, San Marcos, CA

Pregnancy is a vulnerable time period where any influence on maternal wellbeing affects the development and outcome of offspring. A common issue of concern is obesity, which greatly increases the risk for complications, with intergenerational effects extending well into the offspring's adult life. Nationwide, obesity disproportionately affects Mexican Americans, one of the fastest growing minorities. Acculturation, or the process of changes in beliefs and customs as the result of cultural contact, has been associated with obesity. As Mexican traditions clash with American mainstream culture, unhealthy behaviors, stress, and mental health symptoms increase. This population also experiences cultural-specific stressors, such as discrimination, or the negative treatment and attitudes towards an individual or group, which further augment perinatal health risks. Though we know acculturation is associated with disparate health outcomes, such as obesity, we have yet to discover the psychological or social mechanism by which it is occurring during te sensitive period of pregnancy. The purpose of this study is to investigate the roles of depression, stress, and perceived discrimination in the relationship between acculturation and obesity during pregnancy. It was hypothesized that these factors would moderate the acculturation and obesity relationship, where higher levels of each would strengthen the association during pregnancy. Data was gathered as part of an ongoing longitudinal study among 133 Mexican American women with singleton pregnancies who were administered self-report surveys for symptoms of depression, perceived stress and discrimination, and acculturation via adherence to Mexican vs. Anglo cultural values. Pre-pregnancy BMI was determined via medical records and categorized as per WHO guidelines (< BMI 25 as normal weight, >BMI >25 as overweight/obese). T-test analyses revealed that overweight/obese women were less acculturated, i.e. less likely to adhere to Anglo values (t=2.53, p=0.01), but BMI was not associated with stress, depressive symptoms or discrimination. Stress positively moderated the relationship between acculturative values and BMI (B=-0.105, SE=0.045, t, p=0.02), such that women who adhered to less acculturated values and had more perceived stress, had higher pre-pregnancy BMIs. These results suggest that the role of acculturation is complex in shaping the health outcomes of minorities, including obesity risk. Women may be struggling to hold onto Mexican cultural values in U.S. society, which may result in more perceived stress with consequences for gestational physiology and may place them at risk for obesity-related outcomes in pregnancy. Since weight control during this sensitive time period is paramount, our results

have implications for culturally sensitive interventions to minimize obesity prevalence in the fast-growing Mexican-American population.

RELIGIOSITY, SHAME DUE TO HETEROSEXISM & FORGIVENESS: CORRELATES OF SEXUAL ATTITUDES IN OLDER GAY MEN AND LESBIANS

Rikki S. Willingham, Research Assitant

University of North Texas, Denton, TX

Religiosity, Shame due to Heterosexism & Forgiveness:

Correlates of Sexual Attitudes in Older Gay Men and Lesbians

Rikki Willingham, Tosha Griggs & Mark Vosvick Ph.D.

University of North Texas

Religion may influence older gay men's and lesbians' (LG) attitudes about sex (Bonds-Raacke, 2011). While attending religious services older LGs may experience negative messages about their sexual minority status (Lease et al., 2005). Older LGs may internalize these negative messages and feel ashamed of their sexuality (D'Augelli, 2001). High scores on aging sexual knowledge and attitudes scale indicate negative attitudes toward sexual activity in older adults (White, 1998). Forgiveness may help older LGs let go of shame and strengthen self-acceptance (Enright, 1996). Through a minority stress (Meyer, 2003) lens, we hypothesize religiosity and shame due to heterosexism (SDH) are positively associated with negative sexual attitudes. Forgiveness of self is negatively associated with negative sexual attitudes. Religiosity, SDH and forgiveness of self account for a significant proportion of variance in negative sexual attitudes. After IRB approval, we recruited 50 gay men and 50 lesbians from DFW, (M_{age} = 58.99, *SD*= 6.48). Participants were 68% European American, 17% African American and 15% other ethnicity. A hierarchical regression analysis (*F*[10, 89]= 4.17, pR^2=.24, p

Older LGs reported favorable attitudes toward sexual activity this, which suggests that even though sexual activity may decline with age, older LGs maintain a positive attitude towards sexual activity (Lindau, 2007). African Americans reported less favorable attitudes toward sexual activity; this may be due to minority stress associated with ethnicity and sexual minority status (Ramos, 2016). Also, older LGs that scored high on SDH reported less favorable sexual attitudes towards sexual activity in older adults this findin, which g supports that SDH is associated with negative mental health outcomes in some older gay men and lesbians

(Balsam, 2006). Therapeutic Iinterventions should encourage forgiveness of self and positive sexual attitudes towards sexual activity. aAs well as, address the unique challenges faced by African American older gay men and lesbians.

ASSOCIATION OF THE PITTSBURGH SLEEP QUALITY INDEX AND SLEEP MEASURED USING ACTIGRAPHY IN INDIVIDUALS WITH MULTIPLE SCLEROSIS

Christina S. Khou, MA[1], Mayis Aldughmi, PT, PhD[2], Melike Kahya, PT, MS[3], Catherine Siengsukon, PT, PhD[2]

[1]University of Kansas, Lawrence, KS; [2]University of Kansas Medical Center, Kansas City, KS; [3]University of Kansas Medical Center, Mission, KS

Background: The Pittsburgh Sleep Quality Index (PSQI) is a commonly used measure of self-report sleep quality. Studies have found that the PSQI is not significantly associated with sleep measured objectively using actigraphy; however, this relationship has not been explored amongst individuals diagnosed with multiple sclerosis (MS). The purpose of this study was to examine the relationship between scores on the PSQI and sleep measured using actigraphy in this population.

Methods: Data were analyzed from a study investigating sleep in individuals diagnosed with MS. Participants wore actigraphs (GTX3+) for 7 consecutive days and completed the PSQI. Total score and subscale scores on the PSQI and average actigraphy time in bed (TIB), sleep onset latency (SOL), total sleep time (TST), wake after sleep onset (WASO), and number of awakenings (NWAK) were used for analyses. Correlation and multiple linear regressions were conducted to examine the relationship between scores on the PSQI and the sleep variables measured using actigraphy.

Results: A majority of participants (N=76; Mage= 48.4 years-old, SD= 11.3) were female (84%) and diagnosed with relapsing remitting MS (86%; 14% secondary progressive MS). PSQI total scores did not significantly predict any actigraphy measures. However, subscales of the PSQI that were selected based upon bivariate correlations did significantly predict sleep variables measured using actigraphy. PSQI sleep medication use significantly predicted SOL (β=-.26, $p < 0.05$). PSQI sleep duration significantly predicted both TIB (β=-.33, $p < 0.05$) and TST (β=-.36, $p < 0.05$). PSQI sleep disturbance significantly predicted NWAK (β=-.27, $p < 0.05$).

Conclusions: These data indicate that there is an inverse relationship between subscales of the PSQI and sleep measured using actigraphy. Results suggest these two forms of assessment may be assessing different constructs of sleep. Therefore, self-report and objective sleep data should be interpreted and used differently in clinical and research settings. Research should continue to investigate the relationship between self-reported and objectively measured

sleep in order to further characterize this relationship among individuals diagnosed with MS and other chronic conditions.

THE IMPACT OF A SUGARED BEVERAGE SALES BAN WITH VERSUS WITHOUT A BRIEF INTERVENTION ON SUGAR SWEETENED BEVERAGE CONSUMPTION

Alison R. Hartman, BA[1], Angela Wackerly, BFA[2], Cindy W Leung, ScD MPH[2], Ashley E. Mason, PhD[2], Laura Ishkanian, MPH[1], Leeane Jensen, MA[1], Janet Wojcicki, PhD, MPH[1], Samantha J. Schilf, BA[1], Samantha Schleicher, BA[2], Robert Lustig, MD[1], Laura Schmidt, PhD[1], Elissa S. Epel, PhD[1]

[1]University of California, San Francisco, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA

The Impact of a Sugared Beverage Sales Ban With versus Without a Brief Intervention on Sugar Sweetened Beverage Consumption

Background: Heavy consumption of sugar-sweetened beverages (SSBs) is linked to chronic disease in large epidemiological studies. In response to this strong evidence base, academic campuses and other workplaces have begun to implement policies to reduce SSB consumption. One such example is the UCSF Healthy Beverage Initiative (HBI), which eliminated the sale of sugar-sweetened beverages at all UCSF campuses and hospitals. The outcomes of this policy, however, are unknown.

Research question: Does the addition of motivational interviewing counseling to an environmental intervention (i.e., banning sales of sugar-sweetened beverages) improve metabolic benefits to employees following a ban on sales of sugared beverages in the workplace.

Methods: We recruited 214 employees who self-reported consuming greater than 12 oz. per day of SSBs to participate in an evaluation of the UCSF HBI. In two in-person visits (pre-sales ban, and ~10 months later), we collected anthropomorphic measurements, a fasted blood draw for a metabolic panel, and self-reported reward-driven eating. We randomized half of the participants to a motivational interviewing-like counseling group (intervention) or a control group (no counseling). The intervention group had one 10-minute session with a health counselor covering psychoeducation about effects of sugar intake and realistic goal setting, and had two 5-10-minute follow-up phone calls discussing goals and overcoming obstacles.

Results: The intervention group (n=108) reduced their SSB consumption by an average of 23.7 oz/day, while the control group (n= 106) reduced their SSB consumption by an average of 4

oz/day. Specifically, the intervention group consumed significantly fewer ounces of SSBs than the control group both at work (*m* decrease=12 oz; *p*=.0001) and at home (*m* decrease=11.8 oz; *p*=.0007). Both groups trended toward non-significant improvements in waist circumference, sagittal diameter, and reward-driven eating from baseline to follow-up, and the intervention group also showed small changes in BMI (*m* BMI change=-1.68; *p* = .27).

Conclusions: After implementation of the UCSF HBI, both intervention and control groups showed significant decreases in SSB consumption both at work and at home, which suggests that a workplace sales ban on SSBs alone may reduce SSB consumption. Brief counseling may boost effectiveness of a sales ban on SSB consumption. Combining both an environmental change (sales ban) and a brief intervention may be a highly economical and effective public health intervention for institutions to reduce widespread SSB consumption.

FRESHMAN 15: THE PRESSURE TO BE THIN

CeCe Wolfner, N/A, Rucha Kandlur, N/A, Lauren Boddy, BA, Nancy A. Hamilton, PhD

University of Kansas, Lawrence, KS

Body image affects both mental and physical aspects of women in their daily lives. The socially constructed “thin ideal” may lead normal weight individuals (BMI=18.5-24.9) to fall prey to the pressures of maintaining a certain weight. These concerns may become more distressing during college and freshman women may be especially vulnerable to these social pressures during emerging adulthood. Thus, it was predicted that among normal weight freshmen women, distress (measured by the Beck Depression Inventory, (BDI-II) and Perceived Stress Scale (PSS)) would be related with believing that one needed to lose weight. To test this hypothesis, data from a larger, longitudinal study were collected from a sample of primarily Caucasian (83 %) college freshmen women (N=48; mean age=18.2yrs). Consistent with this hypothesis, among normal weight women (n=33), those that reported they were trying to lose weight had significantly higher depression and perceived stress scores (BDI: M=9.12, SD =9.02; PSS: M=19.29, SD=5.90) compared to those who indicated they were not trying to lose weight (BDI: M=2.06, SD=2.02; PSS: M=11.38, SD=6.29), BDI: t(31)=3.06, $p < .01$, PSS: t(31) =3.73, $p < .01$. Interestingly, depression and perceived stress scores were also related to stage of change for weight loss. The highest indicators of distress were found among women who “have a plan to lose weight this semester” (BDI: M=12, PSS: M=20.5) and who have “recently lost weight and were trying to keep it off” (BDI: M=27, PSS: M=28). The lowest depression and perceived stress scores were found among women who were happy with their weight and have not tried to change it (BDI: M=1.6, PSS: M=9.8). Statistically significant group differences were found amongst women at different stages of weight loss for indicators of distress (BDI: F(5,27)=4.83, $p < .01$, PSS: F(5,27)=3.71, $p < .05$).

These preliminary results demonstrate that the desire to lose weight is significantly related to indicators of distress for female emerging adults. During a time of identity formation and transition to college, these body weight concerns may increase vulnerability to disordered eating behaviors and other maladaptive behavioral health patterns. Limitations of these pilot data include lack of racial diversity, small sample size, and limited age variation.

OPTIMIZATION OF MODERN TECHNOLOGY IN COPING WITH STRESS & DEPRESSION

Emily Wong, Student[1], John Hunter, BA[2], Sarah D. Pressman, PhD[3]

[1]University of California, Irvine, Temecula, CA; [2]UC Irvine, Irvine, CA; [3]University of California-Irvine, Irvine, CA

The majority of research concerning the modern use of technology, specifically cellphones, has focused on the degenerative effects it has on users. Previous research has also focused on its specific ties to depressive symptoms. However, few studies have examined the potential benefits that cellphone use can have in stressful social situations. Participants (n=143) underwent the Yale Interpersonal Stressor (YIPS), in which two confederates socially exclude one participant during a brief interaction. The experiment consisted of three cellphone-use conditions: 1) the ability to use a cellphone during the YIPS, 2) the presence of a cellphone, but use was restricted during the YIPS, and 3) the absence of a cellphone during the YIPS. Moreover, the level of subclinical depressive symptoms was considered a moderator, as depression and depressive symptoms have shown to alter stress-responses. Though self-reported data on feelings of stress did not support our stress-buffering hypothesis, participants whose phones were present during the YIPS, felt significantly less excluded. And lastly, the level of subclinical depressive symptoms had no serious moderating effect on the main effect. So, contrary to previous research, those with higher levels of depressive symptoms did not experience *more* exclusion than those with low levels of depressive symptoms. Thus, those with higher levels of depressive symptoms still benefited from cellphone presence. This implies that cellphones do have potential benefits in stressful social situations. However, future research needs to further explore physiological stress responses to gain a more comprehensive picture of how cellphone use can positively influence our physiological functioning, especially for those with higher levels of subclinical depressive symptoms; this allows for possible interventions that optimize the function of our modern technology in coping with stress.

THE EFFECT OF POSITIVE EMOTIONS ON CARDIOVASCULAR REACTIVITY AND RECOVERY FROM STRESS

Casey E. Cavanagh, Ph.D.[1], Kevin T. Larkin, Ph.D.[2]

[1]VA Connecticut Healthcare System, Milford, CT; [2]West Virginia University, Morgantown, WV

Despite the recent interest in the role of positive emotions on physical health, the mechanisms explaining this relation are not well understood. The undoing hypothesis, which proposes that positive emotions speed physiological recovery from stress (Fredrickson & Levenson, 1998), has emerged as a potential mechanism explaining this relation. However, the literature is mixed in demonstrating this effect. Therefore, the purpose of this study was to examine two methods of inducing positive emotions to determine how positive emotions affected cardiovascular reactivity and recovery from stress.

This study employed a 2 x 2 between-subjects design in which the two methods for inducing positive emotions included engagement in a Duchenne-smile manipulation and exposure to a photograph of a pleasant memory. Participants included 61 undergraduates who were randomized to one of four groups: Smile-Happy (Duchenne-smile + personally-relevant pleasant photograph), Smile-Neutral (Duchenne-smile + neutral photographs), No-Smile-Happy (Neutral expression + pleasant photographs), and No-Smile-Neutral (Neutral expression + neutral photographs). Participants engaged in these emotion induction tasks simultaneously while completing a mental arithmetic stressor task.

Cardiovascular reactivity to the stressor task was examined using Smile by Event ANCOVAs on systolic and diastolic blood pressure (SBP and DBP respectively). Results demonstrated a significant main effect of Event for SBP with the personally-relevant photograph groups demonstrating greater reactivity as compared to the neutral photograph groups, $F(1, 55) = 4.30$, $p = .04$. Additionally, results also demonstrated a significant main effect for Smile for DBP with greater reactivity in the Smile groups as compared to the No-Smile groups, $F(1, 55) = 7.56$, $p = .008$. It is possible that the elicitation of specific positive emotions results in increased cardiovascular reactivity (Yogo, Hama, Yogo, & Matsuyama, 1995). Finally, a series of between-subjects ANCOVAs were conducted on area under the curve for SBP and DBP. Results revealed no group differences in SBP and DBP recovery, suggesting that positive emotions did not improve cardiovascular recovery from stress as measured by SBP and DBP and thereby fails to support the undoing effect. Although there was no evidence supporting the undoing effect, the evidence of increased reactivity to the positive-emotion induction tasks suggests the importance of examining emotion specific effects on cardiovascular

reactivity and recovery. Future research should also consider conducting reproducibility studies of the original undoing effect and further explore the clinical utility of the undoing effect.

YOGA FOR TEACHERS

Christine Glissmann, BS in Nutrition and Exercise Physiology [1], Jennifer Huberty, PhD [2], Ali Owens, BS in Communication Studies and World Arts and Cultures [3]

[1]Arizona State University, Tempe, AZ; [2]Arizona State University School of Nutrition and Health Promotion, Phoenix, AZ; [3]YogaWorks, Los Angeles, CA

Introduction:
Nearly 40% of elementary teachers leave their profession due to heavy workloads and stress. Although there is research that has focused on understanding educator stress and the associated consequences on their well-being, there is little research focused on the best way to mitigate stress and improve well-being. Contemplative practices (i.e., mindfulness) have been tested as a means to prevent and alleviate teacher stress with several studies demonstrating their effectiveness. The purpose of this study was to determine interest in using online yoga (Udaya.com) as a means to reduce stress and improve health. Findings from the survey will be used to design an online yoga intervention for teachers before, during, or afterschool.

Methods:
This study was approved by an Institutional Review Board. The 17-question online survey was administered via Qualtrics to preschool and elementary school teachers in a Southwestern state. Teachers were recruited using social media (i.e., Facebook), fliers at schools, and email list servs. Questions were related to teachers' interest in participating in online yoga and perceived principal support for yoga participation.

Results:
Of the 117 who completed the survey, most (78%; n=91/117) were not currently participating in yoga but 75% (n=68/91) had participated in yoga in the past, with, 57% (n=45/79) only ever participating in a few sessions. When asked about interest in participating in online yoga, 84% (n=90/108) were very interested/interested. Almost 90% of teachers (n=96/109) were interested in participating in online yoga in a common area amongst other teachers/staff. The top three reasons teachers were interested in yoga included: stress relief (91%; n=86/94), relaxation (82%; n=77/94), and general health (63%; n=59/94). Teachers perceived their principal would support online yoga participation if it was after school (24%; n=26/109) or before or after school (39%; n=43/109).

Conclusion:
Teachers were interested in having online yoga at their school to reduce stress, and improve their health and felt principals would support online yoga. Online yoga may be a reasonable solution to reducing time restraints, mitigating cost, and providing accessibility to yoga for teachers. Interventions to determine feasibility and initial effectiveness of online yoga for teachers in the school setting are warranted.

A GENOME-WIDE ASSOCIATION STUDY TO INVESTIGATE SHARED GENETIC VARIATION FOR BINGE EATING AND BINGE DRINKING IN COLLEGE STUDENTS

Carley G. Lovell, MS, MA, BS, BA, RN, WHNP-BC[1], Fazil Aliev, Dr.[2], Kenneth Kendler, M.D.[3], Danielle Dick, Ph. D.[4], Amy Adkins, PhD[5]

[1]Virginia Commonwealth University, Henrico, VA; [2]Virginia Commonwealth University Department of Psychology, Richmond, VA; [3]Virginia Institute for Psychiatric and Behavioral Genetics, Richmond, VA; [4]Devlopmental and Clinical Psychology; Virginia Commonwealth University, Richmond, VA; [5]Dept. of Psychology, Virginia Commonwealth University, Richmond, VA

Purpose: To investigate shared genetic variation between binge drinking and binge eating in a large, college-aged sample using a Genome-Wide Association Study (GWAS) approach.

Design: Researchers will perform a secondary analysis of data in a large, longitudinal database consisting of approximately 10,000 individuals, which aims to understand how genes and the environment come together to influence substance use and mental health. Fall and spring surveys from the 2011-2013 cohorts' first year of college were analysed (n~4100). Surveys queried mental and behavioural health outcomes as well as environmental variables. Saliva samples were collected and DNA isolated.

Results: Initial analyses showed that students who binge eat are 1.7 times more likely to report parental problem drinking than students who do not binge eat (95% CI= 1.5, 1.9); and students who binge drink are 1.5 times more likely to report parental problem drinking than students who do not binge drink (95% CI= 1.3, 1.7). The DNA samples were genotyped on the Affymetrix Biobank Version 2 Array, which contains both rare variation, as well as an imputation GWAS grid.

Conclusions: Results offer preliminary steps to determine if previous findings may be due to a genetic susceptibility to binge behaviours. Current GWAS analysis, with considerations of Linkage Disequilibrium and a gene-based analysis, are being conducted to study this hypothesis.

Clinical Relevance: The overall objective of this study is to advance understanding of shared genetic variation between binge eating and drinking, and to contribute to the long-term

objective of informing and designing effective and efficacious prevention and intervention strategies for binge behaviours for college age youth.

ASSESSING HETEROGENEITY IN THE ADOLESCENT PHYSICAL ACTIVITY-SMOKING RELATION: A SEQUENTIAL PROCESSES GROWTH MIXTURE MODEL

Daniel Rodriguez, Ph.D.

La Salle University, Philadelphia, PA

Significance. Adolescence is a key period for the initiation of cigarette smoking (smoking) and progression to a regular habit. 9 of 10 adult smokers initiated smoking by age 18. One factor that may protect adolescents from smoking initiation and progressing to a regular habit is physical activity (PA). Yet, not all PA may be equally predictive. We sought to better understand the PA-smoking relation by testing for developmental heterogeneity.

Methods. Participants were 1361 high school students (50% female; 73% White) taking part in a prospective study (4 years, 8 waves) of the relation between adolescent PA and smoking. We employed Sequential Processes Growth Mixture Modeling (SPGMM) to analyze our data. SPGMM allows for identification of homogenous subpopulations (conjoint classes) on repeated measures of ≥ 2 variables (e.g., smoking and PA), and characterizing the classes on select covariates with multinomial logistic regression. We employed Bayesian Information Criterion (BIC), Adjusted BIC (aBIC), Bootstrap Likelihood Ratio Test (BLRT), average probability of correct classification, and substantive criteria to identify the correct number of conjoint classes.

Results. Four classes were identified: High PA/Low smoking (HPA/LS); Low PA/Consistently high smoking (LPA/CHS); Low PA/Increasing smoking (LPA/IS); moderate PA/Low smoking (MPA/LS). Having greater expectations of the benefits of smoking was associated with an increase in the odds of belonging to all other classes compared to HPA/LS. Participation in alternative PA (e.g., skateboarding) was associated with an increase in the odds of being in LPA/CHS and LPA/IS compared to HPA/LS. Using alternative tobacco products and having peers who smoke were associated with an increase in the odds of belonging to LPA/CHS and LPA/IS versus HPA/LS. By contrast, having PA support and positive expectations of the benefits of PA were associated with a decrease in the odds of belonging to LPA/CHS versus HPA/LS.

Conclusions. The findings of this study suggest the existence of multiple relations among smoking and PA, and that the best predictors of higher smoking and lower PA are smoking expectations and White race. Finally, not all PA is equally protective against smoking. Various physical activities (e.g., skateboarding) may actually increase the odds of smoking.

TEXT & MOBILE MEDIA SMOKING CESSATION SERVICE FOR YOUNG ADULTS IN SOUTH TEXAS

Patricia Chalela, DrPH[1], Alfred McAlister, PhD[2], Kip Gallion, MA[1], Edgar Muñoz, MS[1], Cliff Despres, BJ[1], David Akopian, PhD[3], Andrea Fernandez, MPH[1], Rafael Diaz, BS[1], Amelie Ramirez, DrPH[1]

[1]UT Health San Antonio, San Antonio, TX; [2]The University of Texas, School of Public Health, Austin, TX; [3]University of Texas at San Antonio, San Antonio, TX

Smoking among Latino young adults (18-29) in South Texas is high (23.2% to 25.7%), representing a serious public health problem. Yet few are reached by services to help them quit smoking. Young adults are heavy users of mobile devices for texting and access to mobile media. These have an extraordinary potential for assisting smoking cessation by providing peer modeling and eliciting social reinforcement for behavior change. We present preliminary results of Quitxt a bilingual text messaging and mobile media service to help young adults quit smoking.

Methods: We constructed a bilingual texting and mobile media system that was promoted in South Texas via social media advertising and other recruitment channels. The ads, which featured couples with different themes (disgust with cigarettes or confidence in quitting success) and styles (cowboy, metro/urban, geek, punk and graphic novel), asked potential participants who showed interest in quitting smoking to text a code to our system corresponding to the channel of recruitment. Text messages include links to web pages with additional content and YouTube videos with peer modeling of reasons and skills to quit smoking.

Preliminary Results: Preliminary results showed that enrollments were achieved for 798 participants with a mean age of 29.3 and 55% were below the age of 30. More men (57%) than women (43%) enrolled and 36% identified themselves as Hispanic or Latino. The mean number of cigarettes consumed per day was 11.5. Seven-month texted follow up found that 21% (171) of the enrollees reported abstinence at that point. This is consistent with high rates of success found in studies of telephone counseling for young adults and confirms that text and mobile media service specifically designed for young adults provide a feasible and cost-effective approach to promoting cessation.

Conclusion: Preliminary results provide evidence that young adult smokers in South Texas can be reached via mobile media service. The anticipated outcome is a scalable, culturally relevant, evidence-based and cost-effective service with broad national reach to help young adult Latinos stop smoking, with the potential to reduce health care costs, reduce chronic disease burden and improve quality of life among this young, fast-growing, at-risk population.

THE ADDITIVE ASSOCIATION OF INDOOR CIGARETTE AND MARIJUANA SMOKING ON POTENTIAL EXPOSURE TO FINE PARTICLES

Alexander Posis, BS[1], Neil Klepeis, PhD[2], John Bellettiere, MA, MPH, PhDc[2], Sandy Liles, MPH[2], Vincent Berardi, MS, PhD[2], Ben Nguyen, MPH[2], Suzanne Hughes, MPH, PhD[2], Melbourne Hovell, PhD[3]

[1]Center for Behavioral Epidemiology and Community Health (C-BEACH), Graduate School of Public Health, San Diego State University, san diego, CA; [2]Center for Behavioral Epidemiology and Community Health (C-BEACH), Graduate School of Public Health, San Diego State University, San Diego, CA; [3]San Diego State University, San Diego, CA

Introduction: Exposure to fine particles (<=2.5 microns) from any source can induce respiratory damage and exacerbate bronchitis and asthma. The substantial impact of cigarette smoking on indoor fine particle levels is well known, but the impact of marijuana smoking has not been described. That description is an essential first step toward understanding the public health implications of increasing marijuana use. Using data from 193 households, we examined associations of indoor marijuana and cigarette smoking with fine particle concentrations and tested whether the two particle generating events (PGEs) have a synergistic effect on fine particle levels.

Methods: As part of a larger trial, air particle monitors were placed in 298 homes of families with at least 1 cigarette smoker and 1 child under the age of 14. After monitors continuously measured fine particle counts (0.5 to 2.5 microns) for at least 7 days, participants were interviewed about past 7-day frequency of cigarette and marijuana smoking, other PGEs (e.g., burning candles, burning food) and ventilation activities such as use of exhaust fans. Dichotomized survey responses (any vs. none) from 193 homes that provided data for all relevant PGEs and ventilation activities were used along with mean air particle counts from the 7-day period. Unadjusted geometric means (GMs) were computed to summarize air particle concentrations. After log transformation of mean air particle counts, multivariable linear regression models were used to adjust for other factors associated with fine particle levels. Synergistic effects were then tested by including a multiplicative (cigarette smoking)*(marijuana smoking) interaction term in the regression model.

Results: Homes without indoor smoking had GM counts of 1985 particles/0.01 ft^3 while homes with marijuana smoking only, cigarette smoking only, and both cigarette and marijuana smoking had GM counts of 2869, 3019, and 5250. Regression models adjusted for

home size, other PGEs, and ventilation activities indicated that marijuana smoking was associated with a 68% increase in GM counts while indoor cigarette smoking was associated with a 57% increase (p's < 0.001). No synergistic effect was detected between marijuana and cigarette smoking (p=0.586).

Conclusion: Indoor marijuana and cigarette smoking were significantly associated with elevated fine particle concentrations; their relationship was additive (not synergistic).

TOBACCO USE AND PREFERENCES FOR WELLNESS PROGRAMS AMONG HEALTH AIDES AND OTHER EMPLOYEES OF AN ALASKA NATIVE HEALTH CORPORATION

Tabetha A. Brockman, M.A.[1], Christi A. Patten, Ph.D.[1], Carrie A. Bronars, Ph.D.[2], Matthew Scott, MBA, BSN, RN[3], Rahnia Boyer, BS[3], Harry Lando, Ph.D.[4], Matthew Clark, Ph.D.[1], Ken Resnicow, Ph.D.[5], Paul A. Decker, B.S.[1], Christina M. Smith, BA[1], Agnes Roland, M.A.[3], Marcelo M. Hanza, M.A.[1]

[1]Mayo Clinic, Rochester, MN; [2]Veterans Affairs Medical Center, Minneapolis, MN; [3]Yukon Kuskokwim Health Corporation, Bethel, AK; [4]University of Minnesota, Minneapolis, MN; [5]University of Michigan, Ann Arbor, MI

Objective: To assess health behaviors and preferences for health and wellness programs, among employees of an Alaska Native-serving health corporation in western Alaska. Village-based health aides were compared with other employees on health indicators and program preferences. **Methods:** An electronic cross-sectional survey was distributed to all 1290 staff employed at the Yukon Kuskokwim Delta Corporation (YKHC). The 30-item survey was developed using a community-based participatory approach. Items assessed demographics, tobacco use, physical activity level, body mass index (BMI), and included the Perceived Stress Scale and Brief Resilience Scale. Preferences for health and wellness topics and for program delivery formats were also assessed. **Results:** 467 employees responded (36%) with a final sample 429 of usable data; of which 77% were women and 57% were Alaska Native. The 7-day point prevalence of current tobacco use was 39%. Health aides (n=46) were more likely than other employees (n=383) to currently use tobacco (59% vs. 36%, p = 0.003) and more likely to use a homemade form of smokeless tobacco known as Iqmik (37% vs. 15%, p < 0.001). After adjusting for covariates, greater stress levels was associated (p=0.013) with increased likelihood of tobacco use. Overall, employees reported lower than recommended levels of physical activity and motivation for exercise, 74% had a BMI indicating overweight or obese, and no differences between health aides and other respondents. Top preferences for wellness topics were for eating healthy, physical activity, weight loss, reducing stress, and better sleep. Preferred program delivery formats were in-person, DVD, e-mails and posters. Health aides reported greater interest in tobacco cessation than did other employees (37% vs. 21%, p=0.016) and were less likely to prefer programs delivered by e-mail (28% vs. 50%, p=0.006). Health aides reported higher perceived stress (p=0.006) and lower resiliency (p < 0.001) than other employees. **Conclusions:** This study provides novel information about tobacco use and interest in worksite wellness programs among employees of an Alaska Native-serving health

corporation. These findings are helpful in developing tailored wellness promotion programs for YKHC employees. Promoting healthy lifestyles among health aides and other employees could ultimately have downstream effects on the health of Alaska Native patients and communities that YKHC serves.

Panel Discussion 1 12:15 PM-1:15 PM

USING DISSEMINATION AND IMPLEMENTATION SCIENCE TO ADDRESS DISPARITIES IN OBESITY PREVENTION AND REDUCTION IN PRIMARY CARE

Chanita Hughes-Halbert, PHD[1], Cathy Melvin, PhD[1], Melanie Jefferson, PhD[1], Gary Bennett, PhD[2]

[1]Medical University of South Carolina, Charleston, SC; [2]Duke University, Durham, NC

Background: Provider counseling about lifestyle modification and health behavior change counseling is important for addressing obesity and excess weight, but rates of provider counseling is low. As such, implementation of evidence-based interventions for health behavior change counseling may be sub-optimal.

Objective: The purpose of this panel is to present the results of a demonstration project that was funded by the AHRQ to use the principles of community-based participatory research to disseminate and implement evidence-based strategies for health behavior change counseling into primary care. The following key issues will be addressed: (1) what lifestyle counseling and behavioral change interventions are effective in changing patient outcomes (diet, physical activity and weight loss and/or BMI) for all patients, especially those from racial and ethnic minority groups, in primary care practice settings; (2) what are patient and provider priorities for health behavior change in primary care; (3) what are patient motivations and barriers for health behavior change; (4) to what extent are primary care patients engaged in shared decision making about weight loss/management?

Results: Through an evidence synthesis review, we found that intensive group and individualized coaching combined with pharmacological therapy yielded the best weight loss results in primary care. But, few interventions have specifically targeted racial/ethnic groups and the differences observed between usual care and intervention groups were minimal in minority populations. We also found that interventions that address diet and physical activity are a priority among patients and providers for managing chronic conditions. Both patients and providers indicated that tailored interventions are most likely to be effective, but there was discordance about how the effects of these interventions should be monitored. Patients wanted to be held accountable to providers, but providers wanted patients to be accountable to themselves. These beliefs may explain why 57% of patients were very/completely confident about their ability to lose/manage weight and 62% were making weight loss efforts. Patient perceptions about shared decision-making about weight loss/management were also limited. Only about 25% of patients reported that they selected a weight management option together with their physician, their provider helped them understand weight management, or that their physician explained the advantages and disadvantages for weight managemt.

Conclusions: It is important to actively engage providers and patients in the development of implementation plans that are based on the evidence about the effects of interventions and their priorities and preferences for behavioral interventions to increase the adoption of evidence-based interventions for health behavior change counseling in primary care.

ETHICAL USE OF MOBILE IMAGING, PERVASIVE SENSING, SOCIAL MEDIA, AND LOCATION TRACKING (MISST) TECHNOLOGIES IN RESEARCH

Camille Nebeker, Ed.D., M.S.[1], Katie Crist, MPH[1], Job Godino, Ph.D.[1], Gina Merchant, PhD[2]

[1]UC San Diego, La Jolla, CA; [2]University of California San Diego, La Jolla, CA

Mobile **i**maging, pervasive **s**ensing, social media, and location **t**racking (MISST) technologies show promise in providing more efficient and accurate methods for measuring and intervening on health behaviors. Data from these devices can aid researchers to better understand participant behavior in real world settings and to provide feedback in real time. However, these ubiquitous technologies also present new challenges for human research protections that must be considered to ensure that public health research utilizing them is carried out in a manner that is socially and scientifically responsible. This panel will demonstrate current MISST devices, explain how they are used in public health research and the ethical challenges they entail, and suggested best practices for data collection, data management, and participant protection. The panel will present information on: the combined use of person worn cameras (SenseCam camera), accelerometry, and GPS and GIS (Presenter 1); combined sensors and consumer-level wearables (Presenter 2); social media and networks (Presenter 3); and ethical and regulatory challenges and solutions (Presenter 4). Examples will be drawn from several large interventional and observational studies (e.g., http://cwphs.ucsd.edu/miparc ; http://cwphs.ucsd.edu/smart ; http://abcdstudy.org/). Special emphasis will be placed on older adults, young adults, and adolescents, as sample populations range in age from 6 to 102 years.

Panel Discussion 3 12:15 PM-1:15 PM

DEVELOPING AND IMPLEMENTING EVIDENCE-BASED CLINICAL PRACTICE GUIDELINES: DEPRESSION AND OBESITY

Jason Satterfield, PhD[1], John R. McQuaid, Ph.D[2], Hollie Raynor, PhD[3], Lynn F. Bufka, PhD[4]

[1]UCSF, San Francisco, CA; [2]San Francisco VA Health Care System/University of California, San Francisco, San Francisco, CA; [3]University of Tennessee, Knoxville, TN; [4]American Psychological Association, Washington, DC

When utilized in health care systems, high quality clinical practice guidelines have the potential to improve clinical practice and increase access to appropriate services. The development of such guidelines synthesizes research evidence in order to facilitate clinical decision-making and assist patients in making choices about treatment options. Although widely used in medicine, fewer practice guidelines address interventions specific to mental and behavioral health. The American Psychological Association (APA) and its partners are generating clinical practice guidelines for psychological and health disorders. The goal is to provide trustworthy, evidence-based guidelines the public can use to select among available treatment options. The APA charged an advisory steering committee, including SBM leadership and members, with the task of recommending transparent, best practices for guideline generation and identifying strategies to promote dissemination and implementation. The steering committee studied models adopted elsewhere such as the NICE guidelines and recommended adhering closely to the recent National Academy of Medicine (IOM) reports describing current best practices with regard to guideline generation. The APA has new, draft guidelines for depression and childhood obesity that will be presented and discussed by the panel. In each instance, every effort was made to deal with bias by ensuring that competing perspectives were represented on the guideline panels, a process known as adversarial collaboration. Similarly, both guidelines seek to integrate the best existing empirical evidence with the expertise of the provider and the preferences and values of the recipient of the intervention. This multi-organizational panel first describes the process of guideline development and steps taken to minimize bias and improve quality. Speakers will then briefly present near final findings from the guidelines in development. Strategies to effectively disseminate and implement clinical practice guidelines within health care systems and by individual providers and by patients will also be discussed. A final discussant will guide a conversation about the implications of this project and how to best improve quality of care for all.

Panel Discussion 4 12:15 PM-1:15 PM

NEW TECHNOLOGIES AND ANALYTIC TECHNIQUES: TOWARDS INNOVATIONS IN MONITORING, MODELING, AND MODIFYING FOOD INTAKE

Donna Spruijt-Metz, MFA, PhD[1], Melanie D. Hingle, BS; MPH; PhD[2], Kayla de la Haye, Ph.D.[1], John Lach, PhD[3], Jack Stankovic, PhD[3], Stephen Kobourov, MSC, PhD[4], Mihai Surdeanu, PhD[4]

[1]University of Southern California, Los Angeles, CA; [2]University of Arizona, Tucson, AZ; [3]University of Virginia, Charlottesville, VA; [4]University of Arizona, Tuson, AZ

Dietary behavior, including accurate assessment of intake and valid observations the influences on food-related behavior, continues to pose one of the wickedest problems in obesity research. This panel brings together experts in nutrition, dietary intake, mobile health and social networks to discuss the difficulties and opportunities in assessing and understanding food intake. The considerations in the fields of nutrition obesity that inform which characteristics of measures are considered necessary and sufficient will be revisited and challenged. Some of the solutions that new technologies might offer will then be reviewed. The use of 'digital breadcrumbs' scraped from the web, crowdsourcing and other app and web-based solutions will be compared and contrasted with photography + machine learning approaches. We will examine new work in cyber-physical systems to understand eating behaviors in real time, with a discussion on the kind of data that this technology can offer, and the challenges of modeling that data. The challenges of using it to intervene in real time will be examined. Finally, the very nature of the questions that we need to ask and the data that we need to understand eating behavior will be queried, with a particular emphasis on the real-time, socially networked nature of food consumption.

Panel Discussion 5 12:15 PM-1:15 PM

USING HUMAN COACHES IN DIGITAL HEALTH INTERVENTIONS: A DISCUSSION OF METHODS AND MODELS

Emily Lattie, Ph.D.[1], Kathryn Noth Tomasino, PhD[2], Dori M. Steinberg, PhD, RD[3], Ruth Q. Wolever, PhD[4]

[1]Northwestern University, Chicago, IL; [2]Northwestern University, Feinberg School of Medicine, Chicago, IL; [3]Duke University, Durham, NC; [4]Vanderbilt University Medical Center, Durham, NC

The use of digital health interventions, such as those delivered online and via mobile phones, is an increasingly common strategy to extend the reach and availability of behavioral medicine services. A growing body of research suggests benefits of incorporating human coach support into the provision of these services in order to increase patient engagement and enhance outcomes of digital interventions. However, because including human support is costly, we need to develop a common understanding of effective coaching methods and models in order to best design and implement engaging and scalable digital health interventions. Further, it is important to understand and utilize practical assessment strategies for measuring patient engagement. During this panel, we will review heterogeneous definitions of “health coaching,” discuss various health coaching programs, digital delivery methods, and models of providing coach support. Panelists include behavioral scientists with expertise in developing health coaching programs for general clinical practice and for use in digital health intervention studies. Each panelist will provide a brief overview of the work they have conducted in this field. This panel will provide an opportunity for the panelists and attendees to discuss methods for enhancing patient engagement in digital health interventions in order to broaden the reach of behavioral medicine services in an efficient and effective manner. Attendees will be encouraged to think critically about digital health intervention design and a substantial portion of time will be dedicated to discussion.

CORRESPONDING AUTHOR: Emily Lattie, Ph.D., Northwestern University, Chicago, IL, 60611; emily.lattie@northwestern.edu

Panel Discussion 6 12:15 PM-1:15 PM

GOTTA CATCH EM ALL: HARNESSING VIRALITY OF TECHNOLOGY AND TRENDS TO CATAPULT OUR RESEARCH FORWARD

Carly M. Goldstein, PhD[1], Claudio R. Nigg, PhD, FSBM[2], Eric Hekler, PhD[3], Madeleine P. Ball, PhD[4], Alexander M. Biel, BA [5], Ernesto Ramirez, PhD, MS[6]

[1]Weight Control and Diabetes Research Center; Brown Medical School, Providence, RI; [2]University of Hawaii, Honolulu, HI; [3]Arizona State University, Phoenix, AZ; [4]Open Humans Foundation, Astoria, NY; [5]Arizona State University, Tempe, AZ; [6]Fitabase, San Diego, CA

Increased social media use has propagated videos, photographs, fundraisers, and challenges to a viral level. “Going viral” refers to rapid and wide electronic dissemination of material to many users so that it becomes popularized. The typical research timeline has historically been incompatible with studying viral trends, but some researchers have successfully harnessed virality to recruit participants, conduct studies on timely topics, and generate data for national policies. The purpose of this panel is to focus on targeting virality of technology and trends to benefit research and just-in-time studies that could add substantially to the literature. This panel will feature presentations and a moderated discussion with a team composed of: 1) Two behavioral researchers (one faculty, one graduate student) who created and oversaw two Pokemon, Go! studies shortly following the game’s creation and widespread popularity; 2) the creator of the Open Humans research platform designed to connect researchers with participants willing to gather and share their own data including through projects like the Personal Genome Project; 3) an industry-academic partner with Fitabase specializing in efficiently gathering health and behavioral data by integrating and working with consumer tools, apps, and products; and 4) a behavioral scientist framing this discussion in the context of taking advantage of emerging trends and early-and-often sharing as facets of agile science. This panel’s aim is to provide instruction and suggestions for researchers aiming to harness virality to recruit participants, gather data, or inform policy in a timely manner.

CORRESPONDING AUTHOR: Carly M. Goldstein, PhD, Weight Control and Diabetes Research Center; Brown Medical School, Providence, RI, 02903; carly_goldstein@brown.edu

Panel Discussion 7 12:15 PM-1:15 PM

EXPANDING HORIZONS OF RESEARCH IN INTEGRATED PRIMARY CARE: CHALLENGES, LESSONS LEARNED AND FUTURE DIRECTIONS

Kathryn E. Kanzler, PsyD, ABPP[1], Deepu George, PhD[2], Mario Nicolas, Ph.D.[3], Jeffrey Goodie, Ph.D., ABPP[4], William Isler, PhD[5]

[1]University of Texas Health San Antonio, San Antonio, TX; [2]UT Rio Grande Valley School of Medicine, McAllen, TX; [3]Knowesis, Inc. (Contractor for US AIr Force), San Antonio, TX; [4]Uniformed Services University, Gaithersburg, MD; [5]US Air Force, JBSA Lackland, TX

Integrating behavioral health clinicians in primary care settings has emerged as an essential component of patient centered medical homes. Research assessing the most effective methods for how to best address the needs of primary care populations is mounting. However, conducting clinical research in these settings can be quite challenging due to issues such as IRB hurdles, clinic workflow, time constraints, and limited resources. Our three panelists are currently conducting research in the Primary Care Behavioral Health (PCBH) model of service delivery and will share their unique experiences, to include all the ups and downs of this rewarding clinical research. Our first panelist will discuss challenges with conducting research in a large military healthcare system. They will describe difficulties encountered when attempting to implement a study on shared medical appointments, and how “lessons learned” from this experience were used to plan and execute a weight-loss intervention study. Our second panelist will discuss their grant-funded pilot study, involving examination of a clinical pathway for patients with persistent pain using Acceptance and Commitment Therapy techniques in a patient centered medical home. Our third panelist will describe their work doing a grant-funded multi-site quasi-experimental study of the PCBH model of service delivery in different primary care settings. Our final speaker has decades of experience in integrated primary care practice and research, and they will facilitate discussion and Q&A, as well as highlight the key challenges, lessons learned and future directions for research in integrated primary care.

CORRESPONDING AUTHOR: Kathryn E. Kanzler, PsyD, ABPP, University of Texas Health San Antonio, San Antonio, TX, 78209; kanzler@uthscsa.edu

Panel Discussion 8 12:15 PM-1:15 PM

THE MULTIPLE FACES OF COMMUNITY OUTREACH: THE TULANE PREVENTION RESEARCH CENTER

Carolyn C. Johnson, PhD MS[1], Keelia O'Malley, MPH[2], Catherine Haywood, BSW[1], Naomi Englar, BA[3]

[1]Tulane University School of Public Health and Tropical Medicine, New Orleans, LA; [2]Tulane Prevention Research Center, New Orleans, LA; [3]Tulane Prevention Research Center at Tulane School of Public Health and Tropical Medicine, New Orleans, LA

Community outreach, engagement and partnership are the foundations upon which community behavior change programs are based. Without engaging community residents in health promotion efforts, little to no expectation of success can be achieved. Community engagement can provide strong and relevant input on such issues as methods, media messages, timing, priorities, and cultural sensitivity. A total of 26 Prevention Research Centers (PRCs), funded by the Centers for Disease Control and Prevention (CDC), provide tremendous outreach efforts across the nation to enhance health and decrease disease burden. The Tulane PRC, which has been working in the New Orleans community since 1998, has the mission of preventing or reducing overweight and obesity by addressing the physical and social environmental factors that influence diet and physical activity. The Tulane PRC strives to achieve its mission through community outreach, engagement and partnering. Experience has shown that only multiple methods at various levels can achieve specified goals and objectives; therefore, the purpose of this session is to demonstrate and discuss community outreach methods, focused on: 1) technology via social media; 2) social marketing; 3) grassroots engagement through the Tulane PRC Neighborhood Ambassador Program; 4) policy research; and 5) education of stakeholders and local government. The Tulane PRC community-based efforts have included the development and use of community coalitions for specific programs, evaluating and promoting new bike lanes, providing input on revised zoning around schools, facilitating joint-use agreements between schools and the city, and promoting farmers' and mobile markets. One example is the building of a walking path which provided initial impetus for a total neighborhood revitalization program. Various other examples of successes and challenges will be presented, along with group discussion. The lessons learned are very clear: engage community residents as your partners for any community-based programming through any combination of methods that work.

Panel Discussion 9 12:15 PM-1:15 PM

ENHANCING THE EFFECTIVENESS OF PHYSICAL ACTIVITY INTERVENTIONS IN MILITARY VETERANS THROUGH CULTURAL TAILORING

David E. Goodrich, EdD, MA, MS[1], Katherine S. Hall, PhD[2], Ken Resnicow, Ph.D.[3]

[1]Center for Clinical Management Research, VA Ann Arbor HCS, Ann Arbor, MI; [2]Durham VA and Duke University Medical Centers, Durham, NC; [3]University of Michigan, Ann Arbor, MI

Military veterans represent almost one in ten adult Americans and yet represent a health population not widely understood by those who have not served this group. Veterans are also a medically complex and vulnerable population that has been exposed to a number of psychological, physical, and environmental stressors as part of their military service. These stressors, such as participation in combat, are often unique to the service member population and contribute to a disparate distribution of chronic disease and debilitating conditions among veterans. While active duty service members are healthier than nonveterans due to mandatory fitness standards, many veterans become insufficiently active and develop health problems soon after separation from the military. This critical life transition may be best characterized as a culture shock for some veterans who struggle to adapt without the sociocultural benefits and supports of military life, and constitutes a key time for behavioral health interventions.

This panel will help clinicians and researchers understand the importance of cultural tailoring to promote physical activity and identify innovative strategies for delivering targeted activity programs in veteran populations. Panelists will illustrate how tailoring can go beyond surface elements of culture such as veterans' preferred physical activities or known barriers to exercise, to deeper cultural structures of the warrior identity such as mission, values, and "military as family" that can enhance motivation. The first panelist will present salient characteristics of military culture that can be used to enhance program design and messaging and increase veteran engagement in physical activity programs. The second panelist will review current determinants of physical activity participation for veterans in the Veterans Health Administration and community settings, highlighting areas for improvement and examples where cultural tailoring in program development and implementation has been successful. These presentations will be followed by an interactive discussion with the audience moderated by an innovator in culturally-tailored health messaging and community-based interventions that will emphasize application to real world interventions.

Panel Discussion 10 12:15 PM-1:15 PM

MINDFULNESS TRAINING AND CARDIOVASCULAR DISEASE PREVENTION: FACTS AND MYTHS.

Elena Salmoirago-Blotcher, M.D., Ph.D.[1], Eric B. Loucks, PhD[2], Judson A. Brewer, MD/PhD[3]

[1]The Miriam Hospital & Alpert Medical School of Brown University, Providence, RI; [2]Brown University School of Public Health, Providence, RI; [3]UMass Medical School, Worcester, MA

Nearly half of the observed reduction in coronary heart disease deaths over the past several decades is attributable to improvements in coronary risk factors such as smoking, hypertension, and high cholesterol, with the other half due to progress in medical treatment and procedures. Despite these encouraging results, much remains to be done in the realm of cardiovascular disease prevention, as it remains the number one cause of death worldwide. First, adherence to lifesaving medications like statins and blood pressure lowering drugs is not optimal. Second, maintaining healthy lifestyle changes over the long term remains an elusive goal. Intense research efforts have been directed into finding novel and creative approaches to promote lasting changes in these important behavioral risk factors.

Recent, rigorous meta-analyses have shown that mindfulness training (MT) is effective in preventing depression relapse with moderate to large effect sizes. But can it impact the physical health realm, including cardiovascular health? This panel discussion will focus on a novel and controversial aspect, namely the possible role of MT in the promotion of cardiovascular health. Uniquely, we will examine this topic from an epidemiological, neurophysiological, and medical perspective.

We will first present the current evidence supporting the role of mindfulness in the promotion of cardiovascular health –i.e., through improvements in important cardiovascular risk factors such as hypertension, smoking, diet, obesity, and physical activity.

Next, we will offer an overview of the posited neurophysiological and psychological mechanisms by which MT can promote cardiovascular health – namely its effects on known psychological contributors as well as its effects in changing unhealthy habits.

Finally, we will present the cardiologist’s perspective –with a focus on challenges to the clinical application of this approach and barriers to implementation in a clinical setting. We will conclude with a panelist discussion and Q&A session to obtain panelists’ and audience’s feedback and input on this novel approach to cardiovascular prevention.

Panel Discussion 11 12:15 PM-1:15 PM

BEHAVIORAL SLEEP MEDICINE: CAREER PATHS AND FUTURE CAREER OPPORUTNITIES

Michelle Drerup, PsyD[1], Kelly Glazer. Baron, PhD, MPH, CBSM[2], Christina McCrae, PhD[3], Stephanie A. Hooker, M.S., M.P.H.[2], Samantha Domingo, Psy.D.[1]

[1]Cleveland Clinic, Cleveland, OH; [2]Rush University Medical Center, Chicago, IL; [3]University of Missouri-Columbia, Columbia, MO

Behavioral Sleep Medicine is an area of tremendous opportunities in behavioral medicine because common sleep disorders such as insomnia and obstructive sleep apnea lower quality of life and contribute to physical and mental health problems. Sleep disorders and lack of sleep are an often underdiagnosed and under treated threat to public health. Behavioral Sleep Medicine is a field of clinical practice and scientific inquiry that encompasses the study of behavioral, psychological, and physiological factors underlying normal and disordered sleep across the life span; and, the development and application of evidence-based behavioral and psychological approaches to the prevention and treatment of sleep disorders and co-existing conditions. The panel members will discuss the different settings that Behavioral Sleep Medicine (BSM) providers are embedded including academia, private practice and multidisciplinary sleep disorder centers housed in hospitals or medical centers. The panel members will offer their advice on a wide range of professional and career development issues in the area of BSM, including graduate and post-graduate training opportunities, interdisciplinary collaboration, and future growth opportunities in the field.

MID-CAREER IN BEHAVIORAL MEDICINE: STAYING PRODUCTIVE AND CREATIVE AMIDST CAREER CHALLENGES, TRANSITIONS, AND ADVANCEMENTS

Karen Oliver, Ph.D.[1], Catherine Alfano, PhD[2], Tracey A. Revenson, PhD[3], Christine Rini, PhD[4]

[1]Brown Alpert Medical School/ Providence VAMC, Providence, RI; [2]American Cancer Society, Washington, DC, DC; [3]Hunter College, New York, NY; [4]University of North Carolina at Chapel Hill, Chapel Hill, NC

This panel discussion is geared toward professionals in behavioral medicine whose work includes combinations of research, teaching, clinical care, and/or administration, and who are navigating—or preparing to navigate—the challenges of mid-career. Professional paths in mid-career are often less well-defined than paths through early career, and the challenges of this career stage are often quite different. Challenges and opportunities in mid-career may involve issues surrounding promotion, giving and getting mentoring, leadership, funding, institutional or leadership transitions, balancing increasing demands on time or performance, and potential changes in work setting, position, or environment. Moreover, mentoring regarding decisions, goals, and challenges is often less available to mid-career professionals than to those just beginning their career in behavioral medicine. Questions regarding how to stay creative, generative, and motivated often arise, as do questions about career trajectories and goals, and how to learn about and prepare for them. Questions regarding practical issues to consider when preparing for career advancement are also common and answers are not always easy to find. This panel will discuss these issues across a variety of behavioral medicine careers. Panelists will share personal experiences and strategies for successfully coping with mid-career challenges while capitalizing on opportunities. Discussion will also include “lessons learned” and will provide strategies for audience members to consider when faced with their own unique mid-career challenges. This panel is designed to be interactive and there will be time for questions and discussion.

CORRESPONDING AUTHOR: Karen Oliver, Ph.D., Brown Alpert Medical School/ Providence VAMC, Providence, RI, 02908; Karen_Oliver@brown.edu

Panel Discussion 13 12:15 PM-1:15 PM

NATUROPATHIC MEDICINE 101 - INTRODUCTION TO THEORY AND PRACTICE

Brad S. Lichtenstein, Doctorate of Naturopathic Medicine [1], Cyndi Hope, Doctorate of Naturopathic Medicine [2]

[1]Bastyr University, Lake Forest Park, WA; [2]Bastyr University, San Diego, CA

When Engel proposed his bio-psycho-social model in the late 1970s to address the limits of biomedicine, the field of naturopathic medicine had only 2 medical schools, and small number of licensed providers spread out across the US and Canada. Currently, with seven naturopathic medical schools in North America and more in development, the past two decades has seen a growing interest in this comprehensive medical discipline that is grounded in a whole person, behavioral medicine approach to care. 17 states, DC and the US territories of Puerto Rico and the US Virgin Islands have licensing or regulation laws for naturopathic doctors (NDs), which include graduation from an accredited four-year residential naturopathic medical school and passing postdoctoral board examination (NPLEX).

As a distinct, integrative form of primary health care profession, naturopathic medicine emphasizes prevention, treatment, and optimal health through the use of therapeutic methods and substances that encourage individuals' inherent self-healing process, and acknowledges the importance of behavioral, socioculturalpolitical, cognitive, and emotional factors to treat the whole person. Naturopathic doctors diagnose, treat, and help prevent diseases using a system of practice that is based on the natural healing capacity of individuals. Trained in a wide-array of modalities and therapies, including physiological, psychological or mechanical methods,naturopathic physicians use natural medicines, prescription or legend drugs, foods, herbs, and other natural remedies to treat their patients.

Basic knowledge about naturopathic medicine can benefit patients and providers alike. This presentation will examine the theory, practice and scope of naturopathic medicine, and will introduce the guiding principles of discipline which include The Healing Power of Nature (*Vis Medicatrix Naturae*), Above all Else, Do No Harm (*Primum Non Nocere*), Treat the Cause (*Tolle Causum*), Treat the Whole (*Tolle Totum*), Doctor as Teacher (*Docere)*, and Prevention (*Preventare*). The naturopathic therapeutic order will be outlined and case examples will be used to illustrate the concepts.

CORRESPONDING AUTHOR: Brad S. Lichtenstein, Doctorate of Naturopathic Medicine , Bastyr University, Lake Forest Park, WA, 98155; doctorbrad@thebreathspace.com

Symposium 19 1:30 PM-2:45 PM

UNPACKING RISK PERCEPTIONS: HOW, WHEN, AND FOR WHOM FEELINGS OF RISK MOTIVATE BEHAVIOR CHANGE

Erin M. Ellis, PhD, MPH[1], Rebecca A. Ferrer, PhD[1], Linda D. Cameron, Ph. D. [2], Noel T. Brewer, PhD[3]

[1]National Cancer Institute, Rockville, MD; [2]University of California, Merced, Merced, CA; [3]University of North Carolina, Chapel Hill, Chapel Hill, NC

Many health decision-making theories center on perceived risk of health threats as a motivator of health behavior change. Recent work has explored the unique influences of cognitive and affective subcomponents of risk perceptions, often finding that affective risk perceptions such as worry can exceed, moderate, or mediate the effect of cognitively-based risk perceptions on behavior. It is therefore necessary to examine methodological, contextual, and person-level factors that may shape the strength of the associations between affective risk perceptions and behavior. The aim of this symposium is to highlight the role of affective risk perceptions as a key driver of health behavior, and to extend this work to examine how the cognitive-affective interplay varies across people or behaviors, key measurement and methodology decisions in understanding these different components of risk perceptions, and implications for health communication interventions. The first presentation reports on a multidimensional model of risk perceptions used to predict motivation to engage in 32 different health protective behaviors. Although affective risk perceptions were a consistently strong predictor of motivation to engage in health behavior, they were particularly predictive for threats perceived to be less severe and for people who habitually used specific emotion regulation techniques, suggesting a role for both contextual and person-level characteristics. In the second presentation, willingness to take a disease-preventive medication that caused side effects was associated with cognitive and affective risk perceptions, but only when these risk perceptions were conditioned on whether or not one takes the medication, highlighting the importance of conditionality. In the third study, theoretical work disentangling cognitive and affective risk perceptions is applied in a health communication intervention that utilized metaphoric messaging about skin cancer. The results suggest that affective risk perceptions are important as both a mediator and moderator of the intervention’s effect on sun protection motivation. A discussant whose expertise in risk perceptions spans descriptive, intervention, and meta-analytic research across numerous behavioral contexts will synthesize these studies, highlighting key themes and remaining questions. Together, these innovative

state-of-the-science presentations connect research in social psychology, health psychology, and public health to extend risk perception theory and intervention efforts by highlighting when and for whom affective risk perceptions motivate behavior change.

Symposium 19A

RISK PERCEPTIONS AND MEDICAL DECISIONS INVOLVING TRADE-OFFS

Dr. Erin M. Ellis, PhD, MPH

Background: Perceived risk of a health threat can motivate health-protective behaviors such as using medications that reduce disease risk. However, these medications are often accompanied by side effects, including elevated risks for other adverse health effects, and perceived risk of these side effects may also influence treatment decisions. Moreover, risk perceptions are complex, with deliberative and affective subcomponents whose relation to behavior can differ depending on whether they are queried as conditional or non-conditional on engaging in behaviors that may influence one's risk (e.g., smoking). This study explored the role of deliberative and affective risk perceptions in a medical trade-off decision involving a medication that lowered risk for one disease while increasing risk for another, and whether these associations differed when risk perceptions were queried as conditional on taking or not taking the medication.

Methods: Participants (*N* = 310) read about a hypothetical medication that reduced their risk for a target condition (e.g., cancer), but increased their risk for a side effect (e.g., heart disease). They provided their deliberative and affective risk perceptions about the target condition and side effect, both conditional and not conditional on whether they took the medication. Then they indicated their willingness to take the medication.

Results: When risk perceptions were not queried as conditional on whether the medication was taken, neither perceived risk of the target condition nor side effect was associated with willingness to take the medication, regardless of whether they were deliberative*, target condition*: b = 0.030, *p = .*82 95% CI (-0.23, 0.29); *side effect*: b = 0.032, *p = .*82, 95% CI (-0.23, 0.30), or affective in nature, *target condition*: b = 0.18, *p = .*13 95% CI (-0.056, 0.43); *side effect*: b = -0.10, *p = .*40, 95% CI (-0.34, 0.14). On the other hand, greater perceived risk of the target condition conditioned on *not* taking the medication was associated greater willingness to take it, *deliberative*: b = 0.30, *p = .*041; 95% CI (0.012, 0.58); *affective*: b = 0.23, *p = .*030, 95% CI (0.023, 0.44). For the side effect, greater perceptions of risk if one *did* take the medication were associated with *less* willingness to take it, *deliberative*: b = -0.35, *p = .*006, 95% CI (-0.60, -0.10); *affective*: b = -0.25, *p* = .026, 95% CI (-0.46, -0.030).

Conclusions: Thoughts and feelings of risk about a medication's targeted health condition if one did not take a medication were associated with greater willingness to take it, whereas

thoughts and feelings of risk about its side effects if one did take the medication reduced willingness to take it. These findings suggest conditioning both deliberative and affective risk perceptions on specific behavioral contexts may better capture risk perceptions' role in medical decisions that involve trade-offs.

Symposium 19B

WHEN DO DELIBERATIVE, AFFECTIVE, AND EXPERIENTIAL RISK PERCEPTIONS PREDICT PROTECTION MOTIVATION FOR HEALTH THREATS?

Rebecca A. Ferrer, PhD

Although risk perception is a key concept in many health behavior theories, little research has explicitly tested *when* different types of risk perception (i.e., deliberative, affective, and experiential) predict motivation to take protective action against a health threat (protection motivation). The present study tackled this question by (a) adopting a multidimensional model of risk perception that comprises deliberative, affective, and experiential components (the TRIRISK model), and (b) taking a person-by-situation approach. We leveraged a highly intensive paradigm to test health threat features (i.e., perceived severity) and individual differences (e.g., emotion reappraisal) as moderators of the relationship between risk perception and protection motivation. Multi-level modeling of 2968 observations (32 health threats across 94 individuals) demonstrated that all three risk perceptions were associated with protection motivation, with affective risk perception being the most powerful predictor (B = 0.95, p < .001, *d* = 1.14), compared to deliberative (B = -0.40, p < .001, *d* = -0.41) and experiential (B = 0.11, p =.007, *d* = 0.10) risk perceptions. Analyses also showed interactions among the TRIRISK components and moderation both by person-level and situational factors. For instance, affective risk perception better predicted protection motivation when deliberative risk perception was high (*B* = 0.05, *p* < .001, *d* = 0.13), when the threat was less severe (*B* = -0.03, *p* < .001, *d* = -0.17), and among participants who engage less in emotional reappraisal (*B* = -0.06, *p* = .002, *d* = -0.11). Experiential risk perceptions were more strongly associated with protection motivation when deliberative risk perception was low (*B* = -0.04, *p* < .001, *d* = 0.10), and when cognitive reflection was low (*B* = -0.05, *p* = .009, *d* = -0.10). These findings support the TRIRISK model and offer new insights into when deliberative, affective, and experiential risk perceptions predict health protection motivation.

Symposium 19C

METAPHOR USE IN SKIN CANCER PREVENTION MESSAGES: MEDIATING AND MODERATING ROLES OF AFFECTIVE RISK APPRAISALS

Dr. Linda D. Cameron, Ph. D.

Framing health messages with potent metaphors represents a promising communication strategy for motivating protection behavior, yet little is known about how, when, and for whom they do so. Guided by conceptual metaphor theory, we tested whether messages framing a health risk metaphorically as a familiar hazard (versus literally) increases worry and protection motivations, and whether these effects are specific to individuals with high (versus low) fear of that hazard. We also tested if messages combining matched (metaphoric/metaphoric) versus mismatched (metaphoric/literal; literal/metaphoric) framings of risk and protection actions increase worry and response engagement. In an intervention trial, we tested messages about sun exposure risk framed metaphorically as an enemy sun attacking the skin (versus framed literally) and sun-safe products as superheroes that protect users (versus framed literally). We predicted that an inherent fear of enemies would moderate (enhance) their effects on skin cancer worry, sunscreen intentions, and willingness to pay (WTP) for sunscreen; and that skin cancer worry (but not perceived risk) would mediate their effects on sunscreen intentions and WTP. Adults ($N = 174$) recruited at outdoor recreational areas during summer completed an enemy fear measure; read a flyer with one of the four sets of risk and response messages; and completed measures of worry, perceived risk, sunscreen intentions and WTP. Regression and Process model analyses supported predictions. When the message framed UV risk metaphorically as an enemy sun and sun protection metaphorically as superheroes, recipients high in enemy fear were more worried about skin cancer, more motivated to use sunscreen, and willing to pay higher prices for sunscreen (enemy fear X risk framing X response framing interaction t's > 2.16, *ps* < .03). For those low in enemy fear, the metaphoric messages did not affect worry, intentions, or WTP. Worry mediated the 3-way interaction effects on sunscreen intentions, 95% CI = [0.03, 0.33], and WTP, 95% CI = [0.04, 0.50]. Neither metaphoric message influenced perceived risk. Affective risk appraisals (metaphor-relevant fear and worry) can moderate and mediate metaphors' effects on protection motivations.

Symposium 20 1:30 PM-2:45 PM

LA BUENA VISTA: TRANSLATING 40 YEARS OF CANCER INTERVENTION RESEARCH INTO POLICY AND PRACTICE TO IMPROVE HEALTH OUTCOMES

Shawna Ehlers, PhD, ABPP[1], Barbara L. Andersen, PhD[2], Qian Lu, MD, PhD[3]

[1]Mayo Clinic, Rochester, MN; [2]The Ohio State University, Columbus, OH; [3]University of Houston, Houston, TX

Cancer distress screening and referral for intervention are now required to maintain accreditation by the American College of Surgeons, thus providing "teeth" to longstanding cancer distress screening guidelines. National efforts to implement these guidelines have resulted in significant opportunities to advance implementation science via the creation of natural laboratories in cancer health care settings. This presentation will use the NIH-translational pathway to define the trajectory of 40 years of cancer intervention research. Dr. Ehlers will serve as Chair with introduction of speakers and the structure of the presentation. Dr. Andersen will review 40 years of research, inclusive of promising advancements, stalling points, and current opportunities to speed translation to "real world" health care settings. Dr. Lu will then focus in on the importance of broadening research efforts to reduce health disparities, presenting a contextual, ecologically derived, systems model to understand culture and thus to develop culturally sensitive interventions. Dr. Ehlers will serve as Discussant, including discussion of possible approaches to align stakeholders focused on late stage translational research, evidence-based practice, and the "Triple Aim" of health care delivery.

Symposium 20A

THE TRAJECTORY OF CANCER DISTRESS INTERVENTION RESEARCH: CELEBRATING ADVANCEMENTS AND NAVIGATING BARRIERS TO TRANSLATION

Dr. Barbara L. Andersen, PhD

We have 40 years of cancer intervention research. The milestones of this research body will be reviewed to establish our trajectory as a framework for the presentation, utilizing major meta-analytic and review papers. Highlights include progress in research designs, patient selection, intervention development, and broadening outcomes to a biobehavioral model.

Then a perspective will be offered on recent research efforts, including advancements in knowledge and the redundancy of small impact results. The presentation will conclude with a perspective designed to utilize these advancements and propel translation forward to dissemination in modern day oncology health care settings.

Symposium 20B

TRANSLATION OF CANCER INTERVENTION RESEARCH TO PROVIDE CULTURALLY SENSITIVE PSYCHOSOCIAL INTERVENTIONS THAT REDUCE CANCER HEALTH DISPARITIES

Qian Lu, MD, PhD

Considerable cancer health disparities still exist and persist in the U.S. Elimination of health disparities requires a theoretically guided, multidimensional, culturally sensitive approach to illness prevention and behavioral intervention. Culture is the core and fundamental system of life, designed to ensure the survival and well-being of its members. As a result, culture is part of a complex system that is challenging to define and study. Using a contextual, ecologically derived, systems model to understand culture and to develop culturally sensitive intervention may be the key to reduce and eliminate health disparities. By focusing on understudied and underserved populations, this presentation aims to illustrate that contextual models hold the promise to build cultural competence and move the science forward to understand and eliminate health disparity in cancer. The presenter will first review psychosocial interventions among minority cancer survivors for the past 40 years, and then provide examples of using a community based participatory approach to develop and implement culturally sensitive interventions among Asian American breast cancer survivors. An example of intervention development will be provided in examination of Chinese American breast cancer survivors post-treatment (N=19) who were randomly assigned to a usual care control group, or an intervention group designed to provide emotional and informational support through peer mentoring and education. Compared with control group, the intervention group reported improvements in health outcomes in medium-to-large effect sizes (including overall, emotional, functional and additional concerns quality of life) post-intervention. Future studies with other minority groups are warranted to better understand the efficacy and the mechanisms of social support interventions across culture.

Symposium 21 1:30 PM-2:45 PM

SOCIAL DETERMINANTS OF PHYSICAL ACTIVITY AMONG LATINOS: FROM OBSERVATIONAL RESEARCH TO TRANSLATIONAL INTERVENTIONS

Sandra Echeverria, PhD[1], Rosenda Murillo, PhD MPH[2], Elizabeth Vasquez, DrPH[3], Sandra Echeverria, PhD[1], Ana F. Abraido-Lanza, PhD [4]

[1]CUNY Graduate School of Public Health and Health Policy, New York, NY; [2]University of Houston, Houston, TX; [3]SUNY School of Public Health, Albany, NY; [4]Columbia University, New York, NY

Latinos are the fastest growing population in the United States and are disproportionately affected by overweight/ obesity and participate in low levels of physical activity (PA). A well-documented body of evidence has indicated the social patterning of cardiovascular risk factors, including physical inactivity. However, limited research exists investigating social determinants of active living among Latinos. In this symposium, we present findings using nationally representative data (National Health Interview Survey) to examine associations between key social factors- nativity, occupational status, and neighborhood perceptions- and distinct measures of physical activity. Specifically, we examine how neighborhood perceptions are associated with mobility in older Latino adults, and then examine differences in walking for transport and walking for leisure by nativity status and U.S.-based census occupational categories in middle-aged adults. Building on the population-based observational studies presented, the symposium provides an example of a pilot study that takes into account complex cultural, social, and organizational factors in a communtiy-based PA intervention designed for Latinos. The discussant closes the session highlighting the importance of integrating observational and translational research to more effectively promote adoption of PA across the lifespan in this vulnerable population.

Symposium 21A

NATIVITY AND OCCUPATIONAL STATUS INFLUENCING WALKING BEHAVIORS AMONG LATINOS

Rosenda Murillo, PhD MPH

Walking has long been associated with numerous health benefits, including lower all-cause and cardiovascular mortality. Only select studies have investigated walking patterns among Latinos, and no study has investigated if walking purpose differs by key social determinants such as race/ ethnicity, nativity and occupational status. We analyzed the National Health Interview Survey (NHIS), a yearly nationally representative household survey of the non-institutionalized United States (US) population, which in 2010 collected data on walking for leisure and walking for transport. We classified Latinos (n=5,158) by nativity status and number of years in the US and compared them to non-Latino Whites (n=15,570). The prevalence of each walking behavior was calculated, and duration and frequency of walks in the past week were used to estimate if individuals met national physical activity (PA) recommendations of engaging in at least 150+ minutes of moderate physical activity per week. A clear gradient in walking for transport was observed, with 42% of immigrants living in the US less than 10 years walking for transport and dropping to 30% in US-born Latinos. In logistic regression models adjusted for age, sex, education, poverty level, and obesity, Latinos showed a significantly higher probability of being sufficiently active through transportation activity compared to non-Latino whites [Prevalence Ratio (PR)= 1.62, 95% Confidence Interval (CI)= 1.17, 2.22)]. For leisure walking, none of the models were statistically significant. Tests for interaction showed that occupational status modified observed associations between nativity status and walking for transport and leisure, showing more pronounced differences for lower status and physically demanding occupations. Walking initiatives need to be tailored to working poor and culturally diverse populations.

Symposium 21B

NEIGHBORHOOD SOCIAL COHESION AND MOBILITY LIMITATIONS AMONG OLDER RACIALLY/ ETHNICALLY ADULTS IN THE UNITED STATES

Elizabeth Vasquez, DrPH

Background: Unrestricted walking and climbing ability are markers of functional performance and health in older adults. Several studies have shown that neighborhood contexts can influence mobility in older populations, but little evidence exists on elderly Latinos. This study examines associations between neighborhood social cohesion and mobility limitations in a national sample of older adults and specifically tested if associations differed by race/ethnicity and present disparities faced by Latino older adults.

Methods: We combined the 2013 and 2014 years of the National Health Interview Survey (NHIS), a nationally representative survey of non-institutionalized adults of the United States, and selected adults 60 years and older. Mobility limitation with walking, climbing or both (total) were determined from NHIS questions asking if the participant “experienced difficulty walking or climbing steps.” Self-reported neighborhood social cohesion was evaluated with four questions about whether neighbors help one another, can be counted on, can be trusted, or are close-knit. All four questions answers were summed and divided into three categories representing high, medium and low neighborhood social cohesion. Prevalence of mobility limitations were calculated for each neighborhood category and adjusted for age, sex, education, and physical activity. Models were further stratified by race/ ethnicity and nativity status for Latinos.

Results: Non-Latino whites (NLW) had the highest proportion of individuals living in neighborhoods with high neighborhood social cohesion (42.5%), followed by Latinos (28.5%), and non-Latino blacks (28.4%).When compared with low neighborhood social cohesion living in a neighborhood with high social cohesion conferred a protective effect for total mobility limitation (OR: 0.70; 95% CI: 0.62, 0.78), walking (OR: 0.59; 95% CI: 0.53, 0.67) and climbing limitations (OR: 0.66; 95% CI: 0.59, 0.74) adjusting for race/ethnicity. The association remained statistically significant after further adjustment for sex, age, physical activity, and education. In stratified analyses, foreign-born Latinos living in socially cohesive neighborhoods had lower mobility limitation than the US born.

Conclusion: Neighborhood conditions may be modifiable targets for interventions to reduce socioeconomic and racial/ethnic disparities in mobility limitations and subsequent disability in older adults.

Symposium 21C

PROMOTING PHYSICAL ACTIVITY AMONG LATINOS WITH DIABETES: THE PHYSICAL ACTIVITY SYSTEM OF SUPPORT (PASOS)

Sandra Echeverria, PhD

Latinos are less likely to be physically active than their non-Latino White peers and have a disproportionate burden of Type II diabetes. They are also at increased risk of diabetes-related health complications and mortality. Randomized clinical trials have shown that increasing physical activity (PA) for patients with diabetes can improve glucose and lipid levels, insulin resistance, and weight reduction goals. Nonetheless, there is limited evidence on the effectiveness of physical activity interventions targeting underserved groups, particularly Latinos with low income and limited English proficiency who may face greater challenges in adopting physical activity behavior change. We developed the Physical Activity System of Support (PASOS) program, a community-based intervention designed to increase physical activity among Latinos living with diabetes. The intervention consisted of a culturally-tailored physical activity intervention consisting of scheduled exercises offered twice per week over an 8 week period. We undertook a collaborative process to develop the intervention and describe the multi-level nature of the intervention which incorporates community, organizational, and group-based behavior change approaches. The feasibility of the design and implementation arepresented. A total of 30 participants were enrolled in the study and nearly all participants were poor, had limited English proficiency and had no or limited health insurance coverage. There was over a 70% participation rate and pre-post intervention measures showed significant increases in self-reported PA. A 'systems' model is proposed to support long-term adoption of PA among Latinos.

Symposium 22 1:30 PM-2:45 PM

ADVANCING BEHAVIORAL MEDICINE RESEARCH USING DIGITAL TOOLS TO IMPROVE HEALTH

E. Amy Janke, PhD[1], Danielle E. Jake-Schoffman, PhD[2], Claudio R. Nigg, PhD, FSBM[3], Kassandra I. Alcaraz, PhD, MPH[4], Jeffrey Haibach, PhD, MPH[5], Beth Lewis, PhD[6], Jennifer Duffecy, Ph.D.[7]

[1]University of the Sciences, Philadelphia, PA; [2]University of Massachusetts Medical School, Worcest, MA; [3]University of Hawaii, Honolulu, HI; [4]American Cancer Society, Atlanta, GA; [5]U.S. Department of Veterans Affairs, Washington, DC; [6]University of Minnesota, Minneapolis, MN; [7]University of Illinois at Chicago, Chicago, IL

The Society of Behavioral Medicine is uniquely positioned to lead the way in underscoring the dynamic nature of behavioral medicine to advance the nation’s health and provide direction for the next generation of leaders in the field. At the forefront of these efforts are SBM’s Special Interest Groups (SIGs) that allow members to connect with others who share common interests. During the past year, SBM’s SIG membership has been working on outlining a call to action from the perspective of each of their unique topic areas to promote research advancing behavioral science to inform policy and practice. Many of these forward-thinking papers will be highlighted in an upcoming SIG-focused special issue on Advancing Behavioral Medicine Research: A Call to Action to be published in the Journal of Behavioral Medicine. However, despite the great variety in our SIGs, some common themes emerged across all special issue papers, and one salient theme was the important role of digital tools to improve health. This symposium will highlight the importance of technology to the future of behavioral medicine research and practice as outlined by 4 different SIGs: Ethnic Minority and Multicultural Health (EMMH), Military and Veteran’s Health, Physical Activity, and Evidence Based Behavioral Medicine (EBBM). The EMMH SIG will present their ConNECT Framework as a model for linking the sciences of health equity and behavioral medicine and discuss the ConNECT core principle of Harnessing Communication Technology as a means to assess, understand, document/track, and intervene to advance health equity. The Military and Veteran’s Health SIG will discuss the current landscape of mobile health and other technologies being implemented with military servicemembers, veterans, and their families, and review the unique opportunities and potential barriers to research and practice using such technology in these populations. The PA SIG will review emerging areas of PA intervention research, including the important role technology plays in innovation. Finally, the EBBM SIG will discuss how innovative intervention designs and data collection approaches integrate technology to increase the public health impact of behavioral medicine.

Symposium 22A

HARNESSING COMMUNICATION TECHNOLOGY TO ADVANCE HEALTH EQUITY: PROMISE, POTENTIAL AND POSSIBILITIES FOR THE 21ST CENTURY

Dr. Kassandra I. Alcaraz, PhD, MPH

Colleagues from SBM's Ethnic Minority and Multicultural Health SIG recently introduced the ConNECT Framework as an actionable model for linking the sciences of health equity and behavioral medicine with the goal of achieving equitable health and outcomes in the 21st century. One of ConNECT's core principles, Harnessing Communication Technology, recognizes the potential of technology in assessing, understanding, documenting/tracking, and intervening to advance health equity. Although utilization of emerging technology in behavioral medicine is becoming commonplace, critical gaps remain in employing these innovations to address health disparities, especially among ethnic minority and understudied populations. Using the ConNECT Framework as a guide, this presentation covers four topics: (1) the need for culturally, contextually, and linguistically/literacy relevant content and approaches in communication technology interventions; (2) the promise of Connected Health for broad dissemination of health information and interventions to reduce health disparities; (3) ethical, cultural, and infrastructure considerations for ensuring equitable access, functionality, and usability of technology for multicultural and multilingual groups; and (4) specific recommendations for leveraging emerging communication technologies to enhance reach and dissemination. Communication technology has altered—and continues to revolutionize—the landscape of behavioral medicine. Focused efforts to engage and benefit medically vulnerable populations in this technological era are vital for advancing not only health equity but behavioral medicine as a whole.

Symposium 22B

MOBILE HEALTH AND OTHER TECHNOLOGIES FOR MILITARY AND VETERAN HEALTH BEHAVIOR CHANGE

Jeffrey Haibach, PhD, MPH

Mobile health and other electronic health technologies provide opportunities to link DoD’s 2.1 million servicemembers, VA’s 8.9 million enrolled veterans, and millions more veterans and family members to online resources for health behavior change. Primary areas in current research and practice include nutrition counseling, physical activity promotion, smoking cessation, reducing alcohol and other substance misuse, and broader health promotion and coaching. E-health interventions provide opportunities to promote health through health risk appraisals, monitoring changes in health status, social support, self-management, and behavior change with motivational messages, problem-solving, and goal setting with feedback. These technologies provide benefits to help servicemembers and veterans overcome access barriers and stigmas related to treatment for obesity, substance abuse, and mental health disorders such as depression or PTSD. There are further opportunities to support continuity among transitioning servicemembers, augment clinical care, and reach more of the population VA and DoD serve such as deployed servicemembers and veterans in rural locations. While there are many potential benefits of using mobile technologies in research and practice, there are also unique considerations for protection of DoD/VA patient information and emerging performance enhancing technologies with unknown implications. Additionally, some servicemembers and veterans do not have access to these technologies, respectfully do not want not use them, and, more generally, excess screen time and technology misuse are associated with negative health consequences. Overall and with caveats in mind, there is an immense opportunity through research and practice with mobile health and other e-health technologies to promote positive health behavior change for the health of military servicemembers, veterans, and their families.

Symposium 22C

THE FUTURE OF PHYSICAL ACTIVITY INTERVENTION RESEARCH: EXPANDING FOCUS TO SEDENTARY BEHAVIOR, TECHNOLOGY, AND DISSEMINATION

Beth Lewis, PhD

Despite the increased health risks of a sedentary lifestyle, only 49% of American adults participate in physical activity (PA) at the recommended levels based on self-report data. Objective data indicates that only 10% of Americans meet the PA recommended levels. In an effort to move the PA field forward, we briefly review three emerging areas of PA intervention research. First, new intervention research has focused on not only increasing PA but also on decreasing sedentary behavior. Americans sit on average 7.5 hours per day as measured by an accelerometer, which has significant implications for disease risk. Researchers should utilize randomized controlled trials, common terminology, investigate which behaviors should replace sedentary behaviors, evaluate long-term outcomes, and examine interventions across the lifespan. Second, technology has contributed to an increase in sedentary behavior but has also led to innovative PA interventions. With the prevailing reach of technology, future research is needed to better understand which technological components can contribute to

PA behavior change. PA technology research should focus on large randomized trials with evidence-based components, explore social networking and innovative apps, improve PA monitoring, consider the lifespan, and be grounded in theory. Finally, recently there has been an increased emphasis on disseminating evidence-based physical activity and other health interventions. In an effort to maximize public health impact, dissemination efforts should include dissemination and implementation models, health disparities, and assessments of intervention costs. As PA researchers, we need to challenge the status quo and explore new ideas as strategies to improve PA interventions.

Symposium 22D

USING TECHNOLOGY TO INCREASE THE PUBLIC HEALTH IMPACT OF EVIDENCE-BASED INTERVENTIONS IN BEHAVIORAL MEDICINE

Dr. Jennifer Duffecy, Ph.D.

The dissemination and implementation of evidence-based behavioral medicine interventions into real world practice has been limited. Specific limitations of current behavioral medicine research will be discussed within the context of the RE-AIM framework. Potential opportunities to increase public health by focusing on novel intervention designs and data collection approaches are key. Novel intervention designs include the MOST framework, which aims to optimize multicomponent behavioral and bio-behavioral interventions, and SMART designs, imbedded within the MOST framework, to optimize adaptive interventions. Novel data collection approaches also have the potential to improve the public health dissemination. This presentation will focus on how these innovative methods can use technology to increase the public health impact of behavioral medicine. An example of an effective technology delivered MOST trial will be covered as well as a discussion of technology to improve data collection and dissemination, including technology based strategies to increase retention in trials, increase adherence to healthcare recommendations, decrease patient burden and improve fidelity of interventions delivered. Innovative methods, notably using technology, may have the ability to increase the public health impact of evidence-based behavioral interventions to promote health.

Symposium 23 1:30 PM-2:45 PM

EXAMINING ROOT CONTRIBUTORS TO WEIGHT CONTROL: APPLYING SOCIAL PSYCHOLOGICAL THEORIES IN WEIGHT MANAGEMENT PROGRAMS

Corrine Voils, PhD[1], Danielle Arigo, Ph.D., Licensed Psychologist[2], Tricia M. Leahey, PhD[3], Amy A. Gorin, Ph.D.[4], Shannon S. Taylor, Ph.D.[5], Kathryn I. Pollak, PhD[6]

[1]Durham Veterans Affairs Medical Center, Duke University Medical Center, Durham, NC; [2]The University of Scranton, Scranton, PA; [3]University of Connecticut, Storrs, CT; [4]University of Connecticut; Institution for Collaboration on Health, Intervention, and Policy, Storrs, CT; [5]Durham VA Medical Center, Durham, NC; [6]Duke University, DURHAM, NC

Accumulating evidence demonstrates that the social environment and one’s social perceptions influence weight management behaviors (e.g., food choice, physical activity), and thus, weight loss and maintenance. However, most research efforts focus on the individual in isolation and do not take into account social processes or perceptions. As a result, none has identified the best method(s) for optimizing social processes for weight control. Social psychological theories help to identify relevant social processes to guide assessment and intervention efforts in behavioral weight loss treatment to improve obesity outcomes. The goal of this symposium is to describe three types of social influences on weight control: intrapersonal processes (i.e., perceptions of the self, relative to others), interpersonal processes (i.e., dyadic interactions), and group dynamics. Speakers in this session will present empirical evidence from their weight management trials from each of these perspectives. At the intrapersonal level, Dr. Arigo will report on the frequency of distinct social comparisons (with respect to occurrence, direction, and dimension), and prospective relations between comparisons and session attendance/weight loss/physical activity, from a daily diary study of participants in a weight loss trial. With respect to dyadic interaction, Dr. Leahey will present evidence for Social Accountability Theory, demonstrating that “social accountability” (i.e., from professional and peer coaches) is indeed an important construct within the context of an e-health weight loss maintenance intervention. Dr. Gorin will then discuss the relationship between autonomy support from a spouse/partner and weight loss in two different behavioral programs. Finally, at the level of group dynamics, Dr. Taylor will describe the role of group cohesion in predicting weight loss in a group-based intervention. The discussant, Dr. Kathryn Pollak, will integrate these findings and discuss their implications for understanding and improving behavioral weight control interventions.

Symposium 23A

DAILY SOCIAL COMPARISONS, WEIGHT LOSS, AND PHYSICAL ACTIVITY CONSISTENCY IN A BEHAVIORAL WEIGHT LOSS PROGRAM

Dr. Danielle Arigo, Ph.D., Licensed Psychologist

Social comparisons (i.e., self-appraisals relative to others) made in daily life may influence weight control outcomes such as treatment attendance, total weight loss, and physical activity. However, the types of comparisons that may be *beneficial* for weight control are unclear. The goals of this daily diary study were to (1) characterize the types of comparisons made by weight loss treatment participants in daily life, and (2) to examine both between- and within-person relations between daily comparisons and weight control outcomes. Participants were adults seeking behavioral weight loss treatment (n=186, M_{Age}=52, M_{BMI}=36.9 kg/m^2). For 7 days at the start, middle, and end of a 1-year weight loss program, participants responded to nightly prompts via mobile application; participants categorized comparisons made each day in terms of domain (appearance, financial/work status, other) and direction (comparisons to others deemed superior/upward, inferior/downward, or similar/lateral to the self). Participants wore tri-axial waistband accelerometers to capture minutes in bouts of moderate-to-vigorous physical activity (MVPA). Overall, comparisons were reported on 17% of days and the majority of participants (63%) reported at least one comparison (M=3.11); comparisons were more frequent at baseline (vs. mid- and end-of-treatment; χ^2=15.49, $p$ps>0.10). The overall number of comparisons reported was positively associated with treatment session attendance (r=.20), though greater frequency of upward comparisons was *negatively* associated with percent weight loss at 1 year (r=-0.20, ps<.01). At the day level, upward comparisons were associated with greater between-day variability in MVPA, relative to downward and lateral comparisons (χ^2=9.50, p<.01). A significant interaction between reports of skipping planned MVPA and upward appearance comparisons showed that participants who skipped and made (vs. did not make) upward appearance comparisons engaged in 15 additional minutes of MVPA the following day (F=13.34, p<.01). Findings suggest that daily comparisons predict critical weight control outcomes. Additional work is necessary to determine the mechanisms of these relationships, as well as best practices for harnessing the benefits of comparisons in weight loss treatment programs.

Symposium 23B

SUPPORTIVE ACCOUNTABILITY THEORY: EVIDENCE FROM AN E-HEALTH WEIGHT LOSS MAINTENANCE TRIAL

Dr. Tricia M. Leahey, PhD

Supportive Accountability Theory asserts that e-health interventions with human involvement enhance patient support and accountability, which consequently yields better treatment outcomes. However, this theory is not well tested, and, to our knowledge, no one has examined whether the construct of "supportive accountability" is indeed associated with e-health treatment outcomes. The purpose of this study was to test Supportive Accountability Theory. We examined whether the inclusion of human support in an e-health intervention for weight loss maintenance does in fact enhance participant reported supportive accountability. Further, we tested whether supportive accountability is associated with weight maintenance outcomes. Participants (N= 72, 85% female, 48.5 years, 31.5 BMI) with a recent 5% weight loss were randomized to 1 of 3, 10-month, weight loss maintenance interventions: (1) electronically delivered maintenance strategies plus weekly professional e-coaching (Pro e-coach), electronically delivered maintenance strategies plus weekly Peer e-coaching (Peer e-coach), or maintenance strategies alone (No e-coach). At the start and end of the 10 month maintenance program weight was objectively assessed and supportive accountability was measured via self-report. Participants in Pro e-coach and Peer e-coach reported significantly higher levels of supportive accountability (5.7±2.2, 6.8±2.2, p's≤.05) compared to No e-coach (4.7±1.8) and did not differ from one another (p=.16). Weight regain showed a similar pattern. Pro and Peer arms lost an additional 1.8±7.0kg and 0.5±6.4kg during the maintenance intervention (p=.47) whereas No e-coach regained 3.5±5.7kg (p's<.05). Moreover, higher levels of supportive accountability were associated with less weight regain during treatment (r=-.28, p=.018). This study is the first to provide evidence for Supportive Accountability Theory. In addition, results suggest that peer e-coaching may be an effective and perhaps cost-effective method for providing support and accountability and promoting weight loss maintenance.

Symposium 23C

HELPING AND HINDERING: EXPLORING DIFFERENT TYPES OF SPOUSE/PARTNER SUPPORT IN WEIGHT LOSS

Dr. Amy A. Gorin, Ph.D.

Background: Social support is often cited as a critical ingredient for successful weight management; however, weight loss interventions designed to enhance support among spouses and romantic partners have had mixed effects. Theory-based examinations that pinpoint the specific types of support related to weight loss outcomes can guide the development of more effective couples weight loss programs. This study explored associations between spouse/partner support and weight loss outcomes through the lens of Self Determination Theory (SDT). SDT posits that autonomy support (e.g., providing choices, valuing another's perspective) creates an environment conducive to health behavior change whereas more controlling forms of support (e.g., reminding, criticizing) can hinder goal progress.

Methods: Participants (N=130, M_{AGE}=53.40, M_{BMI}=33.93, 68.5% female) in a larger weight loss trial were randomized to 6 months of Weight Watchers (WW) or a self-guided control group (SG) and assessed at baseline, 3, and 6 months. Measures included the modified Important Others Questionnaire (Autonomy Support) and the two subscales of the Sallis Social Support for Eating Questionnaire (Encouragement of Healthy Eating: reminding about healthy choices, commenting on relapses; Discouragement of Healthy Eating: getting angry about slips, sabotaging). A series of regressions were tested for each predictor and percent weight change. Interactions with intervention group were also examined.

Results:Consistent with SDT, if autonomy support increased from baseline to 3 months, participants experienced a larger percent weight loss at 6 months, B=-.18, p=.01. A similar pattern was found for encouragement of healthy eating, B=-.29, p=.01. Increases in discouragement of healthy eating predicted less weight loss, B=.27, p=.03. This finding was qualified by an interaction with condition, p=.02, which indicated that this effect was significant only in WW.

Discussion: These results suggest that autonomy support from one's spouse/partner can facilitate weight loss success. Interventions that foster autonomy support in couples while decreasing negative remarks and sabotaging behaviors have the potential to bolster goal progress. Rigorous designs are now needed to develop and test SDT-informed weight management programs.

Symposium 23D

COHESION IN GROUP-BASED BEHAVIORAL WEIGHT LOSS INTERVENTIONS

Shannon S. Taylor, Ph.D.

Behavioral weight loss interventions are often delivered in a group format, and it is believed that group cohesion enhances treatment adherence and, thereby, weight loss. However, group social dynamics are rarely measured. The goals of these secondary analyses were to:

1a) assess whether group cohesion measured in the 3rd group session of a behavioral weight loss intervention predicts program attendance and weight loss outcomes, and if so, 1b) explore whether attendance mediates the link between group cohesion and weight loss; 2) assess whether cohesion late in the intervention is associated with weight loss; and 3) characterize the association between change in group cohesion and weight loss over the course of the intervention. 504 Veterans (48.6% Caucasian, 47% African-American; 79.2% Male; *M* age = 58.9, *SD* = 10.1; *M* BMI = 35.9, *SD* = 5.6) initiated a 16-week, group-based behavioral weight loss program involving in-person group visits every two weeks. Group cohesion was measured during the 3rd and 8th group visits. In linear regression models, early group cohesion was not related to group attendance (R^2 = 0.008, *F* (1,323) = 2.54, *p* = .11) or weight loss (R^2 = 0.001, *F* (1,323) = 0.27, *p* = .60). Late group cohesion was also unrelated to weight loss (R^2 = 0.001, *F* (1,236) = 0.28, *p* = .60). Although there was a significant increase in group cohesion during the intervention ($M_{3rd\ group}$= 3.16, *SD* = 0.48; $M_{8th\ group}$ = 3.33; *SD* = 0.44; *t* (190) = 7.59, *p* < .001), change in group cohesion was not associated with weight loss (R^2 = 0.007, *F* (1,190) = 1.43, *p* = .23). These findings are consistent with the limited literature; however, they are inconsistent with theoretical assertions and clinical observations of the influence of group factors on outcomes. Thoughtful consideration to measurement of group dynamics including timing, level of analysis, and psychometric quality of scales is advised for future studies.

Symposium 24 1:30 PM-2:45 PM

INNOVATIVE APPROACHES TO IMPROVING ENGAGEMENT AND EFFECTIVENESS OF INTERVENTIONS IN INTEGRATED PRIMARY CARE

Jennifer S. Funderburk, PhD[1], Kyle Possemato, Ph.D.[2], Jeffrey Goodie, Ph.D., ABPP[3], Robyn L. Shepardson, PhD[1]

[1]VA Center for Integrated Healthcare, Syracuse, NY; [2]Syracuse Veterans Affairs Medical Center, Syracuse, NY; [3]Uniformed Services University, Gaithersburg, MD

Due to the high rates of patients presenting with mental and behavioral health concerns in primary care, primary care is increasingly viewed as an ideal setting for delivering behavioral interventions. As such, the integration of behavioral health providers into primary care to provide these interventions is becoming more common as primary care shifts towards team-based service delivery models. However, the literature on the types of evidence-based interventions that behavioral health providers can employ in the unique primary care setting is still in its infancy. This symposium will present three research studies that have explored ways to improve the engagement and effectiveness of brief interventions in integrated care in an effort to promote future research on innovative approaches to intervention in primary care. The first presentation will share results from a study that examined the impact of various treatment factors, such as treatment duration, modality, and focus, on treatment preferences among primary care patients. The second presentation will summarize the results from a pilot RCT examining the impact of peer support specialists as an augment to a Web-based CBT intervention for primary care Veterans with PTSD. The third presentation will share acceptability data from a group medical visit for patients with hypertension and depressive symptoms to illustrate an innovative approach to engaging patients in care. The discussant will summarize common themes to directly inform and/or stimulate new clinical intervention work to help continue the development of a strong evidence base for interventions that can be implemented in this setting.

Symposium 24A

WHICH TREATMENT FACTORS PREDICT TREATMENT PREFERENCE FOR BEHAVIORAL INTERVENTIONS: A CONJOINT ANALYSIS

Dr. Jennifer S. Funderburk, PhD

Patient treatment preferences may dramatically impact engagement in, and adherence to, behavioral treatment. Thus, examining treatment preferences is a vital initial step toward developing effective behavioral interventions suitable for primary care. Although previous research has examined several treatment attributes separately and their impact on treatment preference, no research has looked at these attributes simultaneously to understand how they are evaluated as a whole by patients. This type of decision making is more characteristic of real-life, where specific trade-offs are evaluated among multiple attributes to determine the patient's preference. There are several attributes characteristic of behavioral treatments offered to primary care patients including: the setting (e.g., primary care, behavioral health clinic), treatment duration (e.g., single, less than 6 sessions), treatment modality (e.g., individual, group), and treatment method (e.g., telephone, in-person). In addition, no research to date has examined an important treatment attribute: focus of treatment (e.g., the presenting problem the patient is interested in changing). This attribute is important as most primary care patients present with multiple concerns, so the focus of treatment may be an important attribute impacting patient preference. The objective of this study was to better understand how these attributes were evaluated as a whole by patients and examine the use of conjoint analysis to help provide a more refined picture of treatment preferences within primary care. Using a random sample of primary care patients who were not engaged in specialty mental healthcare, a total of 216 (76% male, 91% White) primary care patients completed a mailed survey (28% response rate). A majority of participants when ranking attributes independently, rated a preference for individual (86%) and in-person (80%) appointments. For treatment focus, participants identified weight, pain, and sleep as their most preferred treatment foci as compared to other foci (e.g., sadness, anxiety, alcohol, tobacco use, etc). Of those who returned the survey, results of a conjoint analysis will be presented using data from the 173 participants who completed rating their preferences for all 27 scenarios depicting treatment options that varied based on the five attributes to help understand how patients made decisions when all attributes were evaluated together. We will discuss the implications to future research and clinical practices within primary care.

Symposium 24B

COMBINING PEER SUPPORT AND WEB-BASED TREATMENT TO BOOST ENGAGEMENT IN PRIMARY CARE- MENTAL HEALTH SERVICES

Dr. Kyle Possemato, Ph.D.

Veterans who served in Iraq and Afghanistan have high rates of co-morbid PTSD symptoms and hazardous alcohol use. Evidence-based treatments for these problems are available, but multiple barriers lead to low utilization of these treatments. Innovative treatment approaches are needed. Previous research supports that 1) primary care-mental health integration services are associated with increased treatment engagement, 2) technology-based interventions are well accepted by Veterans and are more effective when delivered with professional support, and 3) veteran peer services are associated with improved treatment engagement and overall functioning. We added Peer-Support to an existing Web-based Cognitive Behavioral Treatment, called Thinking Forward, for PTSD and alcohol misuse in response to our previous data that indicated that Veterans wanted interpersonal interaction while receiving Thinking Forward and needed help engaging in the treatment more fully. A pilot randomized controlled trial compared Self-Managed Thinking Forward to Peer-Supported Thinking Forward. Thinking Forward consisted of 24 brief self-guided modules that taught cognitive and behavioral skills to manage trauma-related thoughts and reduce alcohol use. Peer Support services involved meeting with a Veteran peer support specialist as needed over 12 weeks. Peer support specialists discussed the content of Moving Forward modules to help participants process the material and apply it to their own life. Preliminary results indicated that Peer-supported participants averaged a 12-point decrease on the PTSD Checklist at a mid-treatment assessment compared to a 5-point decrease in Self-Managed participants. Peer-support participants also completed 42% more Thinking Forward modules than self-managed participants. Preliminary data indicates that among primary care patients with PTSD and alcohol misuse, combining peer support services with web-based treatment may lead to better treatment engagement and clinical outcomes than web-based treatment alone. Final results will be presented in March.

Symposium 24C

PATIENT AND PROVIDER ACCEPTABILITY OF GROUP MEDICAL VISITS FOR DEPRESSION AND UNCONTROLLED HYPERTENSION

Dr. Robyn L. Shepardson, PhD

Within the team-based environment of integrated primary care, group medical visits offer an innovative way for the primary care team to collaborate in providing both medical and behavioral health interventions to take advantage of the interdisciplinary skillset. Including a physical health condition (e.g., hypertension) as a focus of groups targeting a behavioral health concern (e.g., depression) can reduce stigma to increase engagement and acceptability of treatment. This presentation summarizes feasibility and acceptability pilot data from an 8-session group medical visit for Veterans (*N*=12, *M* age=64.1, *SD*=13.1) with uncontrolled hypertension and depression. The integrated behavioral health provider led the visits (50-90 minutes) and implemented behavioral activation, but was joined at each visit by a member of the primary care team (primary care provider, nurse, physical therapist, or clinical pharmacist), who discussed medications and/or the role of physical activity in managing hypertension. Participants reported high levels of satisfaction (*M*=27.1, *SD*=3.6) with the group on the Client Satisfaction Questionnaire, and 66% attended all 8 visits. Qualitative interviews revealed participants felt the group decreased stigma associated with seeking help, provided camaraderie and accountability, and served as a source of new ideas to try to improve their symptoms. Participants shared their likes and dislikes as well as suggestions for how to engage reluctant patients in group medical visits. All providers reported overall positive feelings about the group medical visit and their willingness to do it again. Providers suggested minor modifications to improve flow within and across visits. We will discuss implications for future research as well as how group medical visits may be used to help increase engagement with behavioral health interventions in primary care.

Symposium 25 1:30 PM-2:45 PM

WOMEN AND CARDIOVASCULAR DISEASE: CURRENT APPROACHES AND FUTURE OPPORTUNITIES FOR INTERDISCIPLINARY COLLABORATION

Valerie Hoover, PhD[1], Elizabeth Jackson, MD MPH[2], Elena Salmoirago-Blotcher, M.D., Ph.D.[3], Katharine S. Edwards, Ph.D.[4], Linda Hudson, ScD ScM MSPH[5]

[1]Stanford University, School of Medicine, Division of Cardiovascular Medicine, Stanford, CA; [2]University of Michigan, Ann Arbor, MI; [3]The Miriam Hospital & Alpert Medical School of Brown University, Providence, RI; [4]Stanford University School of Medicine, Stanford, CA; [5]Tufts University School of Medicine, Boston, MA

Cardiovascular disease (CVD) is the leading cause of death globally and women bear a significant proportion of the disease burden. While CVD mortality in the U.S. has decreased in both men and women in the past couple decades, the rate of decline has been slower in women than men. Research suggests the presence of important sex differences in cardiovascular risk and biopsychosocial factors, symptom presentation, diagnosis and treatment. Appropriate management of women with CVD requires an interdisciplinary approach that incorporates an understanding of these factors. This symposium will provide a multidisciplinary perspective on key sex differences in CVD risk factors and conditions, areas that would particularly benefit from an interdisciplinary approach, and presentation of new qualitative data from focus groups and interventions designed to identify and meet the unique needs of this population. The first talk will provide an overview of the current research on sex differences in CVD and areas for interdisciplinary collaboration. The second talk will present data from a pilot study examining the acceptability and feasibility of a CBT-based intervention to address the psychosocial needs of women with Spontaneous Coronary Artery Dissection, a condition that occurs most often in women. The third and fourth talks will present and discuss qualitative data from focus groups on, respectively, Tai Chi as an alternative exercise option for female survivors of acute coronary events, and the development of a culturally tailored heart disease prevention program for African American women. Together, these talks will present qualitative data on tailored interventions for the prevention and treatment of CVD in women; education on sex differences in biopsychosocial factors related to the prevention, diagnosis and management of CVD; and discussion of opportunities for interdisciplinary collaboration.

Symposium 25A

WOMEN'S CARDIOVASCULAR HEALTH: THE UNIQUE NEEDS OF WOMEN

Dr. Elizabeth Jackson, MD MPH

Women's Cardiovascular Health: the Unique Needs of Women

Women comprise a significant percentage of patients living with cardiovascular disease. Women experience cardiovascular risk factors and related events such as coronary artery disease in different ways than man. More women than men experience angina and myocardial infarction without significant coronary artery disease. More women than men experience heart failure with preserved ejection fraction (HFpEF) which carries significant disability and mortality risk. Women with atrial fibrillation can differ from men in terms of symptom burden and risk for stroke. For cardiovascular disease conditions, the presentation, diagnosis and management frequently differs for women compared to men. These differences frequently increase the psychological burden of CVD among women. Adequate management of CVD must include management of health behaviors and emotional health for both men and women; however an improved understanding of the unique aspects of women living with CVD is required in order to improve quality of care.

This lecture will outline the key cardiovascular risk factors and conditions in which important gender-related differences exist. A discussion of the epidemiology of these risk factors and conditions will be followed by a discussion of the symptom presentations and management strategies unique to women. Finally, a summary of the related critical areas in which collaboratory research is needed will be discussed. The goal of the lecture will be improve the audience's understanding of clinical cardiovascular medicine specifically related to women and to promote a discussion of multidisciplinary research in the area of cardiovascular health for women.

Symposium 25B

TAI CHI AS AN EXERCISE OPTION FOR FEMALE SURVIVORS OF ACUTE CORONARY EVENTS: QUALITATIVE FINDINGS FROM THE GENTLE REHAB STUDY

Elena Salmoirago-Blotcher, M.D., Ph.D.

Background. Cardiac rehabilitation (CR) reduces cardiovascular mortality in survivors of acute coronary events (ACE), but referrals are low especially among women. Tai Chi – a practice based on light/moderate aerobic exercise accompanied by meditative components – could be an alternative exercise option after an ACE.

Methods. To garner patients' perspectives regarding the usefulness of Tai Chi we conducted 3 focus groups among participants enrolled in the Gentle Rehab Study – a pilot RCT study assessing the feasibility and adequate dose of Tai Chi for ACE survivors who did not attend CR. All participants in the parent study were invited to participate and provided informed consent. A semi-structured agenda allowed for the discovery of emergent themes as well as barriers and benefits to use of the tai chi program. LC led the focus groups with input from co-facilitators ES and JK. Interviews were transcribed and analysis was directed primarily by a grounded theory approach.

Results. Of the original cohort, 21/29 (72.4 %) agreed to participate(16M, 5F; age range 44-82 years). Overall, participants reported that Tai chi was enjoyable and easy to practice, while such aspects are missing from traditional CR. Most subjects reported they would like to continue with Tai chi and they appreciated the social support provided by the Tai Chi group. Women uniquely appreciated the meditative components of Tai Chi, and reported reduced stress and anxiety. Women reported that Tai chi allowed them to build strength in a safe and comfortable manner. Women also mentioned that their balance improved, reducing their fear of completing physically challenging activities of daily living. As well, women appreciated how Tai chi exercises are easy to fit into everyday life. Direct quotes and measures of agreement on specific themes will be presented.

Conclusions. Tai Chi offers benefits that might not be directly attainable from CR, with women reporting benefits from the meditative aspect of the practice. The gentleness of the exercises appeals to women in particular, who may not have experience or interest in more vigorous exercise such as that offered in CR.

Symposium 25C

PSYCHOSOCIAL TREATMENT FOR PATIENTS WITH SPONTANEOUS CORONARY ARTERY DISSECTION

Dr. Katharine S. Edwards, Ph.D.

Background: Symptoms of psychological distress are common following myocardial infarction (MI) and depression is highest among young women (Mallik et al., 2006). Spontaneous Coronary Artery Dissection (SCAD) is a rare vascular condition that occurs in patients without traditional cardiac risk factors, disproportionately affects young women (mean age 42, 80% female), and can lead to MI or sudden death (Hayes, 2014; Giacoppo et al., 2014). There is no known treatment for SCAD and recurrence rates are high. Preliminary studies suggest that SCAD patients experience higher levels of psychological distress after MI than patients with coronary artery disease (Liang et al., 2013; Silber et al., 2015; Starovoytov et al., 2016). The aim of the current pilot study was to develop an acceptable and feasible CBT-based intervention to target the unique psychosocial needs of SCAD patients. **Method:** Pre-post questionnaire data were collected from a small sample of SCAD patients (n=8) who completed an eight-week CBT-based psychosocial group intervention. Measures included the Seattle Angina Questionnaire, SF-12, Multidimensional Health Locus of Control scale, STAI, PSS, ISI, PHQ-9, and IES-R as well as between-session feedback forms and post-treatment acceptability interviews. Patients met once per week for two hours for a structured intervention that included mindfulness practice, education about the existing evidence on SCAD, group discussion, training in CBT skills, acceptance and values work, and reviewing homework assignments. **Results:** Qualitative, post-treatment data from this pilot study indicate that women found the social support aspect of the group particularly helpful. Four women reported clinically significant decreases in symptoms of depression, anxiety and trauma, and sleep at 3-month follow up. Perceived stress did not change significantly from pre- to posttreatment or follow-up. **Conclusion:** Results from this pilot study suggest that participants found the group to be both acceptable and feasible and experienced reductions in psychological distress. Additional findings, feedback from participants, and implications for expanding psychosocial group offerings to female cardiac patients through the use of online and mobile technology will be discussed.

Symposium 25D

CULTURAL ADAPTATION OF THE STRONGWOMEN – HEALTHY HEARTS PROGRAM FOR AFRICAN AMERICAN WOMEN

Linda Hudson, ScD ScM MSPH

Purpose: The *StrongWomen – Healthy Hearts Program* is a 12-week community-based program designed to improve heart health among women. Evaluation of national dissemination revealed differential outcomes for African American women leading the authors to explore a cultural adaptation. The purpose of this study was to conduct qualitative research to understand “deep structure” factors and to incorporate these into a culturally adapted curriculum.

Methods: The African American Obesity Research Network (AACORN) paradigm served as a basis for qualitative inquiry of "deep structure" factors. Five focus groups were conducted with a total of 22 participants (3-7 participants per group). Women were eligible if they self-identified as Black or African American, were over the age of 18, not currently engaged in regular physical activity, and had a BMI ≥25. Recruitment was conducted via flyers, announcements to the Boston NAACP membership and local churches, and word of mouth. A $25 gift card was given to participants. Groups were audio-recorded and transcribed. An initial codebook was developed based on the discussion guide and then refined through an iterative and collaborative process with the study team. Data were coded using NVivo (QSR International) and interpreted with the aim of uncovering the values, attitudes, and beliefs of participants and to better understand their worldview, experiences, and cultural perspectives.

Results: Major themes included the perceived severity of CVD, the impact of stress, the role of inequitable access to resources and structural barriers of racism influencing ability to make positive decisions about health, the role of family and friends as both supports for and barriers to engaging in health behaviors, mid-to-high confidence in being able to change behavior, and a desire for more knowledge and resources.

Discussion: The adapted curriculum, *Healthy Hearts for an Abundant Life*, incorporates themes related to the AACORN expanded knowledge domains. It includes stress-reducing activities, tools for self-care, metaphorical language that is based in spirituality, acknowledgement of the role of racism, and strategies and tools consistent with available resources.

Symposium 26 1:30 PM-2:45 PM

WHAT DOES “LIVING WELL” WITH ILLNESS LOOK LIKE?: EXAMINATIONS IN CHRONIC AND LIFE-THREATENING CONDITIONS

Kevin E. Vowles, PhD[1], Donald McGeary, PhD[2], Laurie E. Steffen, PhD[3]

[1]University of New Mexico, Albuquerque, NM; [2]University of Texas Health Science Center San Antonio, San Antonio, TX; [3]Wake Forest University School of Medicine, Winston-Salem, NC

Over the past few decades, increasing interest has focused upon a model of positive or healthy adaptation to illness, as opposed to previous models which tended to prioritize the elimination of an illness state or minimization of a certain set of symptoms. This interest has grown out of multiple domains, including positive psychology, the patient activation movement, therapeutic model developments focusing on constructs such as acceptance and resilience, as well as a pragmatic clinical need to help individuals in successfully adapting to chronic illness. Yet, in many areas, the characteristics of healthy adaptation to, or “living well” with, chronic illness remain unclear. For example, when one experiences chronic symptoms and when treatments have failed to reduce them, is living well even a possibility and, if so, what are its characteristics? The data presented in this symposium will detail the qualities of living well with illness in two significant healthcare conditions, chronic pain and late stage cancer. Dr McGeary will describe cross-sectional findings in 160 active duty service members with chronic pain, which found evidence of two participant clusters. The first reported high levels of pain acceptance and low levels pain catastrophizing and the second reported the opposite. Cluster membership was a strong and significant predictor of depression, PTSD, suicide risk, and healthcare utilization. Dr Steffen will present a daily assessment study of patients with late stage lung cancer, which examined how daily goal setting, including identification and monitoring of progress, related to daily symptoms, treatment engagement, and quality of life. Results, drawn from over 1000 days of data, indicated that those who set goals and worked towards them had higher daily quality of life, less time in bed, better social interactions, more engagement with important activities, and fewer negative side effects from treatment. Dr Vowles will present cross-sectional and longitudinal data collected from approximately 500 community-dwelling individuals with chronic pain, who were clustered according to time spent engaging in struggles for pain control and engagement in valued activities. Findings indicated that individuals who spent the least amount of time struggling for pain control and who were engaged in an adequate level of valued activities were functioning significantly better than those who were not. In combination, the presented data provide guidance on characteristics of “living well” with chronic illness – they include greater

acceptance, more frequent goal setting and monitoring of progress, less time struggling for symptom control, and more time engaging in meaningful activity.

Symposium 26A

PROVIDING A REFERENT FOR ANALYSES OF CLINICALLY SIGNIFICANT CHANGE: WHAT DOES “LIVING WELL” WITH CHRONIC PAIN LOOK LIKE?

Dr. Kevin E. Vowles, PhD

In 1984, Jacobson, Follette, & Revenstrof provided a two-part definition of *clinically significant change* as it pertained to behavioral interventions. The first, *reliable change*, referred to an assessment of whether amount of change on a specific measure, observed in a single individual, exceeded change that could be accounted for by measurement error alone. Thus, reliable change is readily calculated using indices of temporal stability and score dispersion. The second, *clinical significance,* required that, by the end of treatment, an individual’s score had moved outside the range of the “dysfunctional” (Jacobson et al.’s terminology) population and within a "functional" population range. For example, fulfillment of this criterion would occur when the post-treatment depression score in a previously depressed individual was indistinguishable from a never-depressed individual's score. In chronic pain, Jacobsen et al.'s first criterion has been successfully evaluated, but the second has not, as there are no data appropriate for comparison. Pain-free individuals are not an adequate comparison group for those with ongoing pain and there are no data available representing a “high functioning” group of individuals with chronic pain. The present analyses provide initial normative information for such a high functioning group, defined here as the presence of chronic pain in the absence of significant functional disruption. Cross sectional and longitudinal data were collected from approximately 500 community dwelling individuals with chronic pain (data collection is ongoing; current *N* = 437), each of whom completed a battery of assessments, including a measure of self-rated membership in a “dysfunctional” or “functional” population with four response options, assessing the degree to which pain was adversely impacting functioning (e.g., “not at all”, “a little”). This screening measure has previously been used to categorize individuals in this way with group membership having significant associations with current depression and disability. Ratings on this assessment were used to categorize individuals into a functional, dysfunctional, or intermediate cluster and between cluster differences were examined across a number of measures of adaptive (e.g., pain acceptance, values, self-compassion) and maladaptive (e.g., disability, depression, substance misuse) functioning. Significant between-group differences were indicated across these same measures and were particularly pronounced for adaptive functioning. They were also present in both cross-sectional and longitudinal analyses. These results provide a reference point for the second criterion of clinically significant change and may provide a benchmark for assessing it in individuals with chronic pain.

Symposium 26B

THE CONTRIBUTION OF ACCEPTANCE TO CHRONIC PAIN RESILIENCY: A SECONDARY ANALYSIS OF THE ESCAPE STUDY

Dr. Donald McGeary, PhD

There is plentiful evidence showing the long-term negative outcomes associated with poor pain coping and treatment failure (McGeary et al., 2006). Ameliorating variables widely believed to be implicated in poor pain coping may not be enough to improve outcomes (Nicholas et al., 2012), but studies of Acceptance and Commitment Therapy for pain management are starting demonstrate that the promotion of healthy pain coping strategies may prove effective (Vowles et al., 2014). The present study explored the potential of healthy coping interventions in the uniquely complicated population of military service members and veterans with chronic pain (cf. McGeary et al., 2011). Using a similar cluster analysis to that published by Vowles et al. (2008), this study examined how service members differ in how they cope with pain (based on measures of pain acceptance/catastrophizing) and how these differences reflect on pain and psychosocial outcomes using a secondary analysis of the Evaluation of Suicidality Cognitions and Pain Experience (ESCAPE) study (Kanzler et al., 2012). The ESCAPE study included 160 active duty military members and veterans treated for chronic pain through a large military treatment facility in the Southern U.S. who were asked to complete a one-time comprehensive assessment of pain and psychosocial coping. Details can be found in Kanzler and colleagues (2012). A two-step cluster analysis was used to identify coping clusters using data from 99 ESCAPE participants who completed measures of both pain acceptance (CPAQ) and pain catastrophizing (PCS). Cluster analysis revealed two distinct clusters (labelled “Living Well” and “Living Ill”) with good cluster quality based on fit indices and silhouettes. The Living Well [LW; n=75] cluster was characterized by high levels of chronic pain acceptance (high CPAQ Willingness and Activity scores) and low levels of pain catastrophizing (low PCS Helplessness, Magnification, and Rumination scores). The Living Ill [LI; n=36] cluster was comprised of a diametric opposite score pattern. The two clusters were compared on a number of pain and psychosocial variables. Participants in the LW cluster reported significantly lower levels of depression, PTSD, suicide cognitions, and burdensomeness to others (all at p<.001) compared to LI cluster. The LW cluster also reported significantly lower levels of disability (p<.001), pain intensity (p<.001), and 40% fewer healthcare visits in the past year than the LI cluster. Results of this secondary analysis showed a similar pattern of healthy coping as that found by Vowles et al. (2008). These findings suggest that military pain management programs targeting increased pain acceptance have the potential to improve pain-related outcomes and to ameliorate common psychosocial comorbidities of military pain like depression, PTSD, and suicidality.

Symposium 26C

THE IMPACT OF HOPE ON DAILY QUALITY OF LIFE IN LUNG CANCER PATIENTS

Laurie E. Steffen, PhD

Goal-setting, problem-solving, and values-based action are common components of quality of life interventions for cancer (Graves, 2003). These components are sometimes referred to as “hope,” which has been associated with quality of life across multiple types of cancer. The utility of hope has not, however, been tested longitudinally in lung cancer where quality of life is a key treatment outcome given low survival rates and high symptom and treatment burden. The goal of this study was to study relations between hope and quality of life (e.g., social functioning, palliative wellbeing) in lung cancer patients undergoing treatment. Patients with higher hope were expected to report better quality of life and daily levels of hope were hypothesized to predict daily quality of life. Fifty lung cancer patients (58% female, 78% non-small cell, 66% metastatic disease, average age = 68.66, SD = 8.78) completed a baseline questionnaire and 21 daily assessments (M = 20.3 days, SD = 1.3; 1,042 days of data). Multilevel modeling was used to analyze same-day and next-day relationships. Pre-specified models controlled for disease (e.g., time since diagnosis, treatment type, daily disease symptoms) and psychological (e.g., depression, daily affect) factors. Intra-class correlations ranged from 0.64 to 0.75. Patients with higher levels of hope reported higher social and role functioning (estimate = 3.37, SE = 0.90, 95% CI = 1.60, 5.14) and higher palliative wellbeing (estimate = 0.88, SE = 0.24, 95% CI = 0.40, 1.35). On days where patients reported higher hope, they reported higher social and role functioning (estimate = 2.36, SE = 0.70, 95% CI = 1.00, 3.73), better physical functioning (estimate = 2.27, SE = 0.81, 95% CI = 0.68, 3.87), and higher palliative wellbeing (estimate = 0.91, SE = 0.13, 95% CI = 0.66, 1.16). Daily hope appeared to attenuate the negative impact of treatment days on functioning (estimate = 3.33, SE = 1.25, 95% CI = 0.88, 5.77). Daily hope did not, however, predict quality of life in any next-day models. Daily hope was not predicted by cancer symptoms, which suggests that hope may support quality of life regardless of symptom burden.

Symposium 27 1:30 PM-2:45 PM

PEER SUPPORT TO PROMOTE HEALTH BEHAVIOR CHANGE AMONG VETERANS

Katherine D. Hoerster, PhD, MPH[1], Karin Nelson, MD, MSHS[2], Michele Heisler, MD MPA[3], Amy N. Cohen, PhD[4], Edwin Fisher, PhD[5]

[1]VA Puget Sound Healthcare, Seattle and University of Washington, Seattle, WA; [2]VA Puget Sound, Univesity of Washington, Seattle, WA; [3]University of Michigan, Ann arbor, MI; [4]Greater Los Angeles VA Healthcare Center, Los Angeles, CA; [5]The University of North Carolina at Chapel Hill, Gillings School of Global Public Heealth, Chapel Hill, NC

Veterans often have multiple comorbid medical problems, including high rates of obesity and diabetes, which can be effectively managed with activity and diet. It is therefore important for Veteran-serving organizations to identify effective ways to improve Veterans' lifestyle behaviors. Peer support counselors--individuals with lived experience shared with a particular target population--have been utilized effectively in healthcare delivery to address lifestyle behaviors and help patients manage a host of medical conditions. As such, the Veterans Health Administration (VHA) has begun to invest considerable resources in the delivery of peer-delivered and peer-supported services. For example, VHA's Office of Mental Health recently hired over 1000 peer support counselors who are in recovery from mental illness to address well-being among Veterans with psychiatric conditions. VHA is also beginning to expand peer support services to target conditions such as diabetes and obesity in primary care. While research from the general population suggests peer support services may be beneficial in the management of Veteran health and health behaviors, research is limited and thus requires further investigation. Moreover, given that Veterans often have multiple comorbidities, the application of peer support services among Veterans has relevance to addressing lifestyle health behaviors among medically complex non-Veteran patient populations.

This symposium presents a range of perspectives related to peer support services targeting Veterans' health behaviors with implications for Veteran and non-Veteran populations. KH will present preliminary pilot data from a peer support-delivered behavioral weight management program for Veterans with PTSD, and will discuss approaches to intervention development such as iterative refinement and partnered research. KH also will highlight insights into "real world" health promotion treatment complexities, given the medical-psychiatric condition comorbidity being addressed. KN will discuss a novel community-based peer counselor recruitment strategy for a large trial, highlighting issues related to peer support counselor employment, training, and supervision. MH and AC will present data from two large trials of technology- and peer-based behavioral diabetes and weight management interventions among Veterans. Lastly, EF, leader of Peers for Progress, which promotes peer support worldwide, will discuss how the papers exemplify important themes in disseminating peer support services, and healthcare/policy implications for varied settings. This symposium will highlight benefits and challenges of peer support care, and will yield insights regarding ways to optimize patient-centered care to promote healthy lifestyle behaviors using peer-based services.

Symposium 27A

DEVELOPING A PEER SUPPORT WEIGHT LOSS PROGRAM: A MODEL FOR ITERATIVE REFINEMENT AND PARTNERED RESEARCH

Dr. Katherine D. Hoerster, PhD, MPH

PTSD is common in Veterans and associated with increased obesity risk, in part due to unique activity and healthy diet barriers. VA’s 16-week MOVE! weight management program is less effective for Veterans with PTSD. We developed and piloted a 16-week peer-led weight management program tailored for Veterans with PTSD called MOVE!+UP (Improving MOVE! for Veterans with PTSD Using Peer Support). MOVE!+UP was delivered in 4 group sessions by a paid peer support counselor who addressed PTSD-specific weight loss barriers and led Veterans in community walks, followed by six biweekly phone sessions. Three cohorts initiated participation (12/2015-4/2016; N=23). Baseline, 4-week, 16-week, and 6-month quantitative and qualitative data were collected. We obtained input from numerous stakeholders (e.g., peer support counselor, investigative team, clinical stakeholders, national VA leadership). All MOVE!+UP components (e.g., facilitator and participant manuals; fidelity, safety, training, and supervision procedures) were modified after each cohort to better address weight, physical activity, and mediator targets. Veterans reported strong benefits from the support received from other group members and the peer support counselor. Group walks were cited as a particularly helpful aspect. Stakeholders made numerous suggestions for changes, many of which were integrated during iterative refinement. Weight did not significantly decrease from baseline to 4 weeks. However, diet quality, mental health quality of life, and PTSD symptom severity improved (*ps <.05).* Several mediators improved significantly (e.g., diet and activity change strategies). Most 4-week findings were sustained at subsequent timepoints. Although not significant, average weekly physical activity minutes increased from 122 to 186, p=.19. A modified MOVE!+UP will be tested in an uncontrolled pilot and subsequent large-scale trial. This study provides data on a peer-led weight loss intervention addressing mental and physical health of Veterans with PTSD, and a model for iterative refinement and partnered research. This approach may facilitate readiness for future implementation and dissemination.

Symposium 27B

DEVELOPING A PEER SUPPORT PROGRAM TO TARGET HIGH RISK PATIENTS IN PRIMARY CARE

Karin Nelson, MD, MSHS

Cardiovascular disease (CVD) is the leading cause of mortality among veterans, and CVD risk factors remain sub-optimally controlled. The goal of the Vet-Coach ("Veteran peer Coaches Optimizing and Advancing Cardiac Health") study is to test the effectiveness of a home-visit, peer health coach intervention to promote health behavior change among veterans with multiple CVD risk factors. Veteran peer coaches ("Vet-Coaches") will provide social support, health education, and link veterans to clinic and community resources.

The presentation will describe a novel strategy to recruit Vet-Coaches who live in targeted high risk areas. Using geo-coded patient addresses, we generated spatial distributions of hypertension rates by census tract within a 5-mile radius of our clinic and selected areas with the highest rates of poorly controlled hypertension, which comprised 60 census tracts. Each primary care clinic team was given a list of patients living in the target areas with a diagnosis of hypertension. During a staff meeting, we asked providers to review these lists and nominate veterans based on the following criteria: successful use of VA services, successful management of hypertension or other chronic conditions, and experience utilizing community resources. We sent the nominated patients (n=72) an introductory letter prior to conducting follow-up calls to assess interest in becoming a Vet-Coach, which provides reimbursement based on an hourly rate. Vet-Coach interviews are ongoing. To date, we have interviewed n=9 veterans. Results of the Vet-Coach recruitment will be discussed along with ideas and lessons learned, with a specific focus on working in primary care clinics and developing a peer support program that is integrated into primary care clinic work flow.

Symposium 27C

TECHNOLOGICALLY ENHANCED COACHING (TEC): A PEER SUPPORT MODEL TO IMPROVE DIABETES OUTCOMES

Dr. Michele Heisler, MD MPA

This presentation will describe several approaches we have tested to enhance peer coach interventions with interactive, e-Health tools. In several completed VA and non-VA RCTs we have found that both mutual peer support and peer coaching models are more effective than usual care, financial incentives, and nurse care management in improving glycemic control and other clinical and patient-centered outcomes in high-risk adults with diabetes. While peers can be trained in effective approaches to support other patients’ self-management behaviors, such coaches necessarily lack the diabetes and diabetes medications content expertise to help patients better share in treatment decisions and goal-setting with their health care providers. Accordingly, in a prior study we developed and tested in an inner-city, predominantly ethnic minority population a tailored, interactive diabetes and diabetes medication information tool that outreach workers and peers could use to facilitate discussions with patients. Such tools can enhance the sustainability and effectiveness of coaching programs to better prepare adults to set self-management goals and action plans, and to discuss treatment options with their providers. We then adapted this tool for the VA and VA patients and are using mixed methods to evaluate over 6 and 12 months peer coaching supported with this tool, peer coaching alone, and usual care among 312 predominantly African American Veterans with diabetes and poor glycemic control at the Detroit VA. Recruitment has been completed and we will have final results in January, 2017 to report. In this presentation, we will describe the e-Health tool, present results of in-depth qualitative interviews with peer coaches and patients on experiences with the intervention, and present the final results of this comparative effectiveness pragmatic clinical trial.

Symposium 27D

ONLINE WEIGHT MANAGEMENT WITH PEER SUPPORTS FOR PEOPLE WITH SERIOUS MENTAL ILLNESS

Dr. Amy N. Cohen, PhD

People with serious mental illness are at high risk for obesity, related cardiovascular illness, and premature death. In-person weight management programs result in lower weight, and are found in treatment guidelines. However, these programs are often not provided, and patient enrollment and retention is low. Programs require substantial clinician time and frequent clinic visits. Barriers could be addressed using computerized provision of diet and exercise services, combined with motivation and support from peer coaches. 276 overweight patients were recruited from a Veterans Affairs mental health clinic, and assigned to 1) online weight management with peer coaching, 2) in-person clinician-led services, or 3) treatment as usual. At 6 months, patient outcomes were assessed and interviews conducted. There was a significant group by time interaction (F=4.02, p=.02). In the online plus peer coaching group, the model estimated an average change in body mass index (BMI) from baseline to six months of 34.9±.4 to 34.1±.4 . This change corresponds to a 2.8 kg (6.2 lbs) weight loss (t=3.2, p=.001). No significant change in BMI was seen in either the in-person (t=.10, p=.92), or treatment as usual (t=-.25, p=.80) group. There was a significant difference in how many participants completed the intervention with 31% of the online group but none of the in-person group completing the intervention ($\chi2=24.2$; p<.0001). Those in the online group received, on average, 7.9 (SD=6.8) peer coaching calls.

Addressing physical health in mental health clinics has been a challenge. Online weight management with peer supports is feasible, and well received. An online program with peer support produces weight loss, and may have greater effectiveness than clinician-led services. With this program, there is little burden on clinicians, costs are low, and service provision is patient-centered.

Symposium 28 1:30 PM-2:45 PM

LESSONS LEARNED FROM THE DEVELOPMENT AND DISSEMINATION OF THREE HEALTH POLICY BRIEFS

Joanna Buscemi, Ph.D.[1], Caryn E. Peterson, PhD, MS[2], Karriem S. Watson, DHSc, MS, MPH[3], E. Amy Janke, PhD[4]

[1]DePaul University, Chicago, IL; [2]University of Illinois at Chicago, Chicago, IL; [3]University of Illinois at Chicago (UIC), Chicago, IL; [4]University of the Sciences, Philadelphia, PA

The Society of Behavioral Medicine's (SBM's) Health Policy Committee (HPC) provides structured and guided opportunities for SBM members and SBM special interest groups (SIGs) to increase the impact of their work through the development and dissemination of health policy briefs. The purpose of this symposium is to 1) present three of the health policy briefs that have been developed in the past year and 2) provide members with “lessons learned” and tips for writing and disseminating the briefs. First, Dr. Karriem Watson will discuss a health policy brief highlighting the importance of supporting lung cancer screening among high-risk populations. Dr. Watson will discuss the process of engaging academic and like-minded organizations and partners in the development and dissemination of the brief. Next, Dr. Caryn Peterson will describe a brief in support of efforts to reduce barriers to Human Papillomavirus (HPV) vaccination services in order to increase vaccine coverage. Dr. Peterson will discuss how to develop recommendations to address the most pressing areas in need of change and how to describe the epidemiologic, clinical, and public health features of the problem in a manner appropriate to a policy brief. Third, Dr. Amy Janke will present a brief on improving psychological care for pain to reduce risk for opioid misuse. Dr. Janke will discuss how to collaborate across disciples to reach consensus on the framing of the brief and the recommendations, and the process of using an initial brief as a springboard for future related briefs, papers, presentations and outreach. The discussant and Chair of the Health Policy Committee, Dr. Joanna Buscemi, will close with remarks on key strategies for developing authorship teams, engaging organizational partners, and increasing the reach of briefs through broad dissemination.

Symposium 28A

THE DEVELOPMENT OF SBM’S POLICY BRIEF: “INCREASING HPV VACCINATION UPTAKE: AN URGENT OPPORTUNITY FOR CANCER PREVENTION”

Dr. Caryn E. Peterson, PhD, MS

HPV infection is common in the U.S. and globally, and affects both males and females through its association with oral cancer, anal cancer, genital warts, and cervical cancer. HPV vaccination is a safe and effective primary prevention strategy to reduce the infections that can lead to these cancers. However, vaccination coverage remains low and subject to barriers at multiple levels.

SBM supports the goals outlined by Healthy People 2020, the President's Cancer Panel, and the National Vaccine Advisory Committee to increase vaccination coverage among both males and females. The purpose of this brief was to present a set of recommendations for legislators, policymakers, healthcare providers, and health systems in order to address critical barriers to HPV vaccination.

Recommendations for legislators and policymakers focus on ensuring adequate resources to achieve the nation's HPV vaccination goals. Recommendations for healthcare providers and systems center on strengthening the quality and consistency of HPV vaccination recommendations for all eligible patients.

This presentation will first describe the critical need for increased HPV vaccination among males and females, outline barriers to vaccine uptake, and present SBM recommendations. Then it will describe the process of developing the brief. Key aspects of this process include: gathering a multidisciplinary team of co-authors in order to describe the issue in its most current form; developing recommendations to address the most pressing areas in need of change; and describing the epidemiologic, clinical, and public health features of the problem in a manner appropriate to a policy brief.

Symposium 28B

ENCOURAGING LUNG CANCER SCREENING IN HIGH RISK POPULATIONS: LESSONS LEARNED FROM THE DEVELOPMENT OF A HEALTH POLICY BRIEF

Dr. Karriem S. Watson, DHSc, MS, MPH

Informing key stakeholders of policy implications that impact health outcomes is vital to advocacy, research and interventions aimed to mitigate health inequities. Collaborations with multi-stakeholders including community, academic and advocacy partners to develop policy briefs is an essential tool to support dissemination of policy recommendations. Several academic stakeholders along with policy and advocacy partners aligned with the Society of Behavioral Medicine (SBM) to address United States Preventive Services Task Force (USPSTF) recommendation of low-dose computed tomography (LDCT) screening of the chest for eligible populations to reduce lung cancer mortality. This group assembled to support efforts that further advances the translation of research findings into practical applications for health care providers and healthcare systems. Lung cancer mortality exceeds that of breast, colorectal and prostate cancer mortality combined. The assembly of academic, advocacy and policy stakeholders resulted in policy recommendations for both healthcare providers and healthcare systems as well as policy makers. The primary lessons learned from this collaborative development of a policy brief included: 1) the importance of identifying academic partners who value a multi-disciplinary approach to examining healthcare policy implications; 2) the benefit of including the expertise of recognized thought leaders as part of the collaboration; 3) the advantage of leveraging existing partnerships to identify common alignments such as multi-institutional grant projects; and 4) the incorporation of principles of shared governance to ensure that each stakeholder has an active voice in the process.

Symposium 28C

IMPROVING ACCESS TO PSYCHOLOGICAL CARE FOR INDIVIDUALS WITH PERSISTENT PAIN

E. Amy Janke, PhD

Objective: Present SBM’s first policy brief addressing psychological care for chronic pain and provide an overview of lessons learned from writing this brief.

Background: Growing concerns regarding prescription opioid misuse, abuse and opioid-related fatalities have initiated a re-evaluation of the long-term efficacy and potential risks of this class of medications in the management of pain, and are part of a larger dialogue on the way pain is managed in U.S. Policy makers have articulated a need for clear, evidence-based guidance to help inform pain policy. Persistent pain is common, expensive, and debilitating, and requires comprehensive assessment and treatment planning. Recently released opioid prescribing guidelines by the CDC (2015) emphasize the importance of using non-opioid therapies before considering opioid treatment for those without a malignant illness. The favorable risk-benefit ratio of psychological approaches suggests these be considered early on, prior to other treatments that carry more risks. Unfortunately, despite persuasive evidence supporting the efficacy of many non-opioid therapies, access to these interventions is severely limited. Access to psychological care including pain assessment, intervention, and prevention approaches needs to be available in all clinical contexts, for all populations, at all points during the entire trajectory of the illness. To achieve this, we must prioritize reimbursement of evidence-based psychological approaches for pain management and improve provider training and competencies to implement these approaches

Approach: This presentation will provide an overview of the pain policy brief and discuss how the core team of authors was cultivated from the SBM membership. The authorship team identified many needs to address with regards to pain policy, and the presentation will review the process of conceptualizing ideas and narrowing the brief’s focus to develop a specific, targeted message. The process of writing the brief and engaging stakeholders—from within SBM and other organizations—will be discussed as will ensuring the brief's synergy within the larger landscape of emerging pain policy. Opportunities identified by the authorship team to use the brief as a foundation for ongoing activities in the area of pain policy (outreach, briefs, presentations, papers) will be discussed.

Symposium 29 1:30 PM-2:45 PM

STIGMA AS A PATHWAY TO OBESITY AND NEGATIVE HEALTH OUTCOMES IN UNDERSERVED POPULATIONS

Emily Panza, MS[1], Lisa Shank, M.S.[2], Janet Tomiyama, Ph.D. [3], Mary S. Himmelstein, PhD[4], Kristina M. Decker, M.A.[5]

[1]Rutgers, the State University of New Jersey, Highland Park, NJ; [2]Uniformed Services University of the Health Sciences, Bethesda, MD; [3]University of California, Los Angeles, Los Angeles, CA; [4]University of Connecticut, Hartford, CT; [5]The University of Memphis, Memphis, TN

Obesity is associated with serious negative health consequences, ranging from cardiovascular disease to early mortality, and is disproportionately prevalent among gender, racial, ethnic, and sexual minority groups. Given the wide prevalence and multi-determined nature of obesity, it is necessary to examine how multiple aspects of identity (e.g. race, sexual orientation) intersect with social contextual factors, emotional experiences, and behaviors to heighten risk for obesity.

The research presented here examines how one social contextual factor, societal stigmatization, cuts across multiple aspects of identity and serves as a pathway to the development and exacerbation of obesity in a variety of underserved groups. This is highlighted in the first symposium presentation, which identifies weight stigma as a risk factor for the development of physical health problems and medical conditions in a group of overweight active duty military, a specialized population with a cultural emphasis on fitness. The second presentation builds on these findings by examining how multiple sources of stigma contribute to the weight disparity among a triply oppressed group, overweight and obese sexual minority women. This study uses EMA methods to examine whether lifetime and daily exposure to stigma based on sexual orientation, gender and weight increases risk for overeating and binge eating. These findings are extended in the next presentation, which examines strategies for coping with weight stigma across racial and gender minority groups. Using population-based data, this presentation reveals how race and gender interact to promote either effective or harmful coping, displaying how strategies for coping with stigma impact obesity. The final presentation will explore the relation between stigma and health outcomes in emerging adults, demonstrating that greater stigma and higher BMI are associated with more exercise avoidance, depression, and poorer physical health in young adults with low self-reported resilience.

The symposium discussant, an expert on stress, weight stigma and obesity, will tie together these diverse presentations, which employ a variety of methods to explore obesity-related outcomes in multiple underserved groups, collectively highlighting the relevance of social stigmatization as a pathway to the development and worsening of obesity in marginalized populations. This has important clinical implications, suggesting that efforts to reduce stigma and to teach effective strategies for coping with stigma may enhance the effectiveness of obesity interventions and improve health in all populations.

Symposium 29A

MINORITY STRESS AND EATING BEHAVIOR AMONG OVERWEIGHT AND OBESE SEXUAL MINORITY WOMEN

Emily Panza, MS

Background. Sexual minority women are nearly three times more likely to be overweight or obese than their heterosexual counterparts, but little research has investigated potential mechanisms that underlie this disparity. One such mechanism may be minority stress. Sexual minority women are members of multiple socially stigmatized groups: being non-heterosexual, being female, and for 60% of sexual minority women, being overweight. As a result, they are chronically exposed to minority stressors like social stigmatization (i.e. being treated unfairly or differently). In an effort to reduce distress, sexual minority women may use overeating and binge eating to cope, behaviors that, over time, promote weight gain and confer risk for obesity.

Methods. The current study used cross-sectional and Ecological Momentary Assessment (EMA) methods to examine whether lifetime and acute experiences of stigmatization heighten risk for overeating and binge eating in overweight and obese sexual minority women. 30 overweight and obese (BMI>25) sexual minority (e.g. lesbian, bisexual, queer) women were recruited from the local community. Participants completed baseline assessments of eating behavior and minority stress related to sexual orientation, weight and gender, and for five days, used a smartphone application to report instances of perceived stigmatization, overeating, binge eating, stress, and negative emotion five times daily.

Results. Using hierarchical linear modeling,we expect to find significant links between stigmatization, overeating and binge eating behaviors, such that greater lifetime stigmatization, as well as daily acute stigmatization, will be associated with greater rates of overeating and binge eating behaviors among overweight and obese sexual minority women. We also expect that daily episodes of stigmatization will increase risk for concurrent and future elevations in stress, negative emotion, overeating and binge eating.

Conclusion. This is the first study to examine the intersecting effects of sexual orientation, gender, and weight-based minority stress on eating behavior among overweight and obese sexual minority women. Given the lack of research investigating the origins of the weight disparity among sexual minority women, findings will facilitate obesity prevention efforts and improve our ability to develop effective and culturally tailored obesity interventions for this multiply marginalized group.

Symposium 29B

THE RELATIONSHIP BETWEEN WEIGHT STIGMA AND PHYSICAL HEALTH IN MILITARY PERSONNEL WITH OR AT HIGH-RISK OF OVERWEIGHT/OBESITY

Ms. Lisa Shank, M.S.

Perceived weight stigma and discrimination are associated with adverse health indices, such as elevated cortisol and inflammation, lipid/glucose dysregulation, and poorer self-rated health. The relationship between weight stigma and physical health may be particularly relevant for military personnel, given the increasing prevalence of overweight/obesity (OW/OB), a cultural emphasis on fitness and weight/shape, and a high rate of reported weight stigma. Therefore, we investigated the relationship between weight stigma and physical health in 117 active duty service personnel (66.7% male; 35.0% Non-White; age: 30.8±7.4y; BMI: 29.5±2.5 kg/m^2) prior to enrollment in an obesity prevention program. All had OW/OB and/or a family history of OW/OB (family history only: n = 7). Participants completed an adapted Experiences and Sources of Weight Stigma Questionnaire which produced a total score (WS) and a military-specific subscale (WS-M), and the Weight Bias Internalization Scale-Modified (WBIS). Participants reported the presence of medical conditions (e.g., type 2 diabetes, hypertension, asthma) and responses were dichotomized to indicate presence (≥ 1; n = 57) or absence (n = 60). After adjusting for age (y), sex, height (cm), and body fat (%), WS and WS-M were significantly associated with the presence of a medical condition (*OR*s = 2.63, 2.76, respectively, *p*s = .04). WBIS did not moderate the relationship between WS or WS-M and physical health (*p*s > .05). Similar patterns were observed when BMI was used as a covariate instead of height and body fat. Findings suggest that weight stigma may contribute to the development or maintenance of medical conditions, perhaps due to associated biochemical stress. Alternatively, active duty personnel with a medical condition might experience more frequent weight stigma; for example, when visiting healthcare providers. Longitudinal studies should prospectively examine the relationship between weight stigma and physical health among service members, who may be a particularly high-risk subgroup.

Symposium 29C

MEET ME AT THE CROSSROADS: WEIGHT-STIGMA AT THE INTERSECTIONS OF RACE AND GENDER

Dr. Mary S. Himmelstein, PhD

A large literature demonstrates the harmful psychological, behavioral, and physical health outcomes associated with weight-stigma, but few studies have systematically examined intersectionality in weight-stigma. Studies have disproportionately focused on White women, with little attention given to weight-stigma in Asian, Black, or Hispanic women or stigma in men. Examining weight-stigma in non-White women and men is essential because the prevalence of obesity varies along racial lines with greater prevalence of obesity in Black and Hispanic populations. This study examined intersectionality (race, gender) using a diverse national sample of 2,378 individuals matching demographics from the US census. Participants identifying as Asian, Black, Hispanic, and White responded to questions about their experiences with weight-stigma and strategies employed to cope with weight-stigma. Women reported experiencing more weight-stigma than men, but no differences in stigma emerged as a function of race. In coping with weight-stigma, Black women were less likely to cope with stigma using negative affect and disordered eating strategies, while Hispanic women were more likely to cope with weight-stigma via disordered eating strategies. Black men were more likely to cope with stigma via increased eating. No coping differences emerged for Asian women or Hispanic men. These results suggest potential protective factors against poor health outcomes associated with weight-stigma for Black women, but potentially exacerbating factors for Hispanic women and Black men. This study represents the first systematic exploration of weight-stigma and coping in non-White men and women. Given we found no differences in experienced weight-stigma as a function of race, it is imperative that more research be focused on weight-stigma in underserved populations in order to understand the unique stigma processes these populations face.

Symposium 29D

PROFILES OF WEIGHT STIGMA AND MENTAL HEALTH: ASSOCIATION WITH HEALTH OUTCOMES AMONG EMERGING ADULTS WITH OVERWEIGHT/OBESITY

Kristina M. Decker, M.A.

Objective. Rates of obesity continue to soar among emerging adults. Weight-based stigma and poor mental health are associated with negative physical health outcomes among young people with obesity. We aimed to examine how varying patterns of risk (stigma, mental health, stress) and protective (resilience) factors relate to health outcomes.

Method. 196 emerging adults (61% White, 16% Black, 12% Hispanic; 60% female) enrolled in our study via Amazon Turk and a university subject pool in the U.S. MidSouth. These 18-25-year-olds (M_{age}=22.38, *SD*=2.01) completed measures of Weight Self-Stigma, Stigmatizing Situations, Depression, Anxiety, Perceived Stress, Resilience, and Exercise Avoidance. Body Mass Index (BMI) was calculated from self-reported height and weight. Participants reported perceived health status (‘How would you rate your overall physical health?’) from *poor* to *excellent*. In Mplus 7.4, Latent Profile Analysis (LPA) was used to generate profiles of stigma, mental health, stress, and resilience and examine how the resulting profiles were associated with exercise avoidance, BMI, and perceived health.

Results. Based on standard fit statistics, the following 3 classes emerged: 1) low stigma, low risk, high resilience (LLH; N=58); 2) high stigma, high risk, low resilience (HHL; N=50); 3) moderate stigma, moderate risk, moderate resilience (MMM; N=88). Exercise avoidance significantly differed across classes with LLH class members reporting the least exercise avoidance (*M*=11.31, *SE*=1.07) and HHL members reporting the most avoidance (*M*=32.54, *SE*=1.89). Individuals in HHL (*M*=31.43, *SE*=.78) and MMM (*M*=31.61, *SE*= .86) reported significantly higher BMIs than those in LLH (*M*=28.10, *SE*=.66). Individuals in LLH reported significantly better physical health (*M*=3.60, *SE*=.14) than those in HHL (*M*=2.65, *SE*=.14) and MMM (*M*=2.91, *SE*=.11).

Conclusions. Person-centered findings reveal significant health disparities among young people with overweight/obesity with those most at risk (i.e., have higher BMI, poorer physical health, greater exercise avoidance) reporting higher depression, anxiety, stress and lower

resilience (i.e., ability to bounce back from distress). Such health disparities should be prioritized in obesity intervention development.

Symposium 30 1:30 PM-2:45 PM

FERTILITY, PREGNANCY, AND BIRTH IN THE AGE OF REPRODUCTIVE TECHNOLOGIES: CHALLENGES AND OPPORTUNITIES FOR BEHAVIORAL MEDICINE

Marci Lobel, Ph.D.[1], Lauri Pasch, PhD[2], Lisa Rubin, Ph.D. [3], Jennifer Nicoloro SantaBarbara, MSW, MA[4], Marci Lobel, Ph.D.[1]

[1]Stony Brook University, Stony Brook, NY; [2]University of California San Francisco, San Francisco, CA; [3]New School for Social Research, New York, NY; [4]Stony Brook University, Long Island CIty, NY

The extraordinary evolution of reproductive technologies in recent years has included methods to help infertile couples conceive and bear children, and to reduce the likelihood that offspring will suffer from heritable diseases for which their parents are at-risk. Although such technologies offer great promise to improve human health and well-being, they also pose potent moral, emotional, behavioral, and tangible challenges for people considering their use. The increased availability of reproductive technologies and their impact on individuals, families, and society make it imperative to understand the psychosocial milieu of these technologies. For example, what are the emotional consequences of using assisted reproductive technologies such as in-vitro fertilization and pre-implantation genetic diagnosis (PGD)? Conversely, do emotional factors including decisional conflict or distress affect the success of these technologies? What mental health services might be needed by individuals using assisted reproductive technologies? This symposium will feature cutting-edge behavioral medicine research on assisted reproductive technologies to further scientific investigation and to inform the development of appropriate clinical services. The first presenter will describe results from a large longitudinal study of individuals undergoing fertility treatment, focusing on identification of clinically-significant distress and use of mental health services. The second presenter will discuss findings from in-depth interviews focused on decisional distress surrounding PGD in individuals of reproductive age who carry a heritable genetic marker for breast cancer. The third presenter will describe a meta-analytic review of studies to evaluate the association of emotional distress with outcomes of assisted reproductive technologies. The Discussant will highlight points of agreement and disagreement from the findings presented, offer a conceptual overview to integrate the three presentations and ground them in research and theory on stress, and highlight how this work can be used to advance research and treatment for people using assisted reproductive technologies.

Symposium 30A

PSYCHOLOGICAL DISTRESS AND ASSISTED REPRODUCTIVE TECHNOLOGY USE

Lauri Pasch, PhD

Although there is no doubt that the use of fertility treatments offer the opportunity to conceive for many couples who would not otherwise have been able to, they are clearly a mixed blessing. Despite significant advances in success rates, treatment cycles still fail more often than they succeed and many couples endure multiple failures. We present data from a large prospective cohort study of couples seeking fertility treatment funded by the NIH to address three main research goals. First, we describe the psychological consequences of treatment failure. Second, we investigate risk factors for greater distress. Third, we examine the use of mental health services for fertility patients and the extent to which they target those at greatest psychological risk. From five fertility practices in Northern California, we recruited 352 women and 274 men at the start of treatment for infertility and followed them over the subsequent 18 months. Depression, anxiety, fertility treatment outcome, and mental health service use were assessed over the course of the research. Major results include: 1) rates of psychological distress following fertility treatment failure are extremely high, 2) psychological distress does not predict the outcome of fertility treatment, but the outcome of fertility treatment predicts subsequent increases in psychological distress, 3) the most important predictor of whether someone will experience a major depressive episode during fertility treatment is not how distressed they are at the beginning, but instead their lifetime history of major depression, 4) most patients report that they are not offered and do not use mental health services during fertility treatment, and high risk patients are not targeted for mental health service referrals. We conclude that clinically significant psychological distress is very common during fertility treatment and after failure, and that those are particular risk can be readily identified. However, most patients and partners do not receive and are not referred for help, even those at high risk for serious psychological distress. Strategies for addressing these findings will be discussed.

Symposium 30B

“IS IT WORTH IT?”: DECISIONAL CONFLICT IN CONSIDERING PRE-IMPLANTATION GENETIC DIAGNOSIS FOR HEREDITARY CANCER RISK

Dr. Lisa Rubin, Ph.D.

Background: *BRCA1* and *BRCA2* gene variants are associated with increased susceptibility of breast and ovarian cancer ranging from 20-76%, contingent on other genetic and environmental factors. Further, individuals with *BRCA1/2* gene variants face a 50% chance that their gene variants will be transmitted to their genetic offspring. To address this risk of transmission, reproductive options, such as preimplantation genetic diagnosis (PGD), a technology in which *in vitro* fertilized (IVF) embryos are tested before implantation (with only unaffected embryos transferred to the uterus), are increasingly being offered to *BRCA1/2* gene variant carriers. However, for many individuals and couples, deciding whether to use PGD and, if unsuccessful, when to stop, are fraught decisions, where costs and benefits are uncertain and difficult to weigh.

Methods: Qualitative interviews were conducted with 39 reproductive-age *BRCA1/2* gene variant carriers about their views of PGD. Participants were predominantly female-identified (89%) and partnered (76%); 42% had children, with 21% reporting that they had completed their plans for childbearing. Data were analyzed using inductive thematic analysis.

Results: Among the 15 (38%) participants who had considered PGD, decisional conflict was a key theme. This report emphasizes the types of conflicts reported by participants, and the contexts in which these conflicts occur. Conflicts emerged in the contexts of participants' (1) reproductive goals, experiences, and pressures; (2) *BRCA*-related risk perceptions; (3) perceptions of assisted reproductive technologies (ARTs); (4) financial resources; and (5) personal cancer risk management strategies. Particularly for those choosing PGD, conflicts were iterative and dynamic, as participants faced unexpected difficulties and ethical dilemmas.

Conclusions: The rapid expansion of ARTs, including the use of PGD for inherited disease susceptibility markers, threatens to outpace clinical and scientific understanding of the associated decisional tasks and dilemmas. Qualitative studies highlighting the content and contexts of decisional conflicts in PGD can inform research at the intersection of decision science and ARTs, as well as clinical interventions to reduce patient conflict and increase decision satisfaction.

Symposium 30C

DOES MATERNAL DISTRESS PREDICT ASSISTED REPRODUCTIVE TECHNOLOGY OUTCOMES? A META-ANALYTIC INVESTIGATION

Jennifer Nicoloro SantaBarbara, MSW, MA

Nearly 1.5 million (6%) married women in the U.S. between the ages of 15-44 are infertile. Infertility can leave a woman feeling defective, angry, out of step with her peers, and lonely (Benyamini, Gozlan & Kokia, 2009; Frederiksen, Farver-Vestergaard, Skovgard, Ingersiev, & Zacharia, 2015). In the U.S., half of infertile women seek treatment via assisted reproductive technology (ART), which for many is physically and emotionally taxing (Demyttenaere, Nijs, Evers-Kiebooms, & Koninckx, 1991; Klonoff-Cohen 2008). Stress and related negative emotions have the potential to reduce ART success through both biological and behavioral mechanisms that affect the likelihood of pregnancy. However, systematic analysis of this topic is lacking. This review evaluated the association of women's emotional distress with likelihood of treatment success via ART. Meta-analysis using a random-effects model was conducted on prospective studies (*k* = 21) that examined levels of anxiety, depressive symptoms, or perceived stress before and during treatment in women undergoing ART who achieved successful outcomes versus women who did not (total *N* = 4,801). This is the first known meta-analysis to examine depressive symptoms and the first to distinguish pre-treatment from procedural distress in evaluating their association with ART outcomes. Results indicate that women who experienced greater anxiety, depressive symptoms, or perceived stress before treatment were less likely to have favorable outcomes. Effect sizes were small but statistically significant. Emotional distress during treatment did not predict outcomes. Fail-safe *N* values provided little evidence of publication bias. ART is considered a last resort for infertile couples who seek to have a biological child and its use is becoming increasingly common. Thus, there is a need for rigorous research to elucidate factors that affect and are affected by ART outcomes and to identify the mechanisms responsible for these effects. Based on our review of existing research, this presentation will offer recommendations for the design of future studies. Improving our understanding of the experience and outcomes of ART is a critical first step to reduce the considerable personal, familial, and societal costs associated with infertility and its treatment.

Symposium 31 1:30 PM-2:45 PM

THE SOCIAL SIDE OF HEALTH: COMMUNAL COPING WITH ILLNESS CAN IMPROVE HEALTH BEHAVIOR AND OUTCOMES

Kelly Rentscher, MA[1], Vicki Helgeson, PhD[2], Caitlin Kelly, M.A.[3], Tracey A. Revenson, PhD[4]

[1]University of Arizona, Madison, WI; [2]Carnegie Mellon University, Pittsburgh, PA; [3]University of Utah, Salt Lake City, UT; [4]Hunter College, New York, NY

This symposium brings together innovative research on communal coping—a relationship process in which family members view a health problem as shared and engage in collaborative action to address it. These presentations showcase family research across laboratory and real world settings with a diverse set of methods (observation, self-report, text analysis) and health samples (diabetes, alcohol use, smoking-related heart and lung disease) to suggest that a communal approach to addressing health problems can impact chronic illness management and intervention outcomes. Rentscher presents data on how increases in patient and spouse communal coping behaviors and language use during couple-focused interventions for health-compromised smoking and alcohol use predict successful treatment outcomes. Helgeson presents data on how patient and spouse communal illness appraisals are associated with patient self-care behavior, perceived support, and illness-related distress among couples coping with type 1 diabetes. Kelly presents data on how collaboration with parents matters for the daily management of diabetes among emerging adults that live within and outside of the parental home. Finally, Revenson will provide commentary and discussion. Together, these presentations and commentary highlight communal coping as an important potential mechanism through which relationships influence health behavior and outcomes.

Symposium 31A

PARTNER COMMUNAL COPING IN THE CONTEXT OF COUPLE-FOCUSED INTERVENTIONS FOR HEALTH PROBLEMS

Kelly Rentscher, MA

Communal coping – a relational process in which partners view a problem interdependently as *ours* rather than *yours* or *mine*, and take collaborative action to address it (Lyons et al., 1998) – has emerged as an important correlate of relationship quality and predictor of partner health. Several studies also link couples' first-person plural pronoun use (*we*-talk), a linguistic marker of communal coping, to change processes in couple-focused interventions for health problems and addictions (Hallgren & McCrady, 2015; Rentscher et al., 2015; Rohrbaugh et al., 2012). Here we present findings from two intervention studies with a combined sample of 56 couples, in which one partner either abused alcohol or continued to smoke cigarettes despite having heart or lung disease. Specifically, this study involved a process analysis of specific interview techniques designed to activate communal coping, where the objective was to identify session-level changes in *we*-talk and observed couple behavior from before to after the therapist's intervention. Pronoun measures for each partner were obtained via computerized text analysis from transcripts of partner speech during the target therapy sessions. Teams of trained raters also observed the target sessions and made independent ratings of couple communal coping behaviors. Patient and spouse *we*-talk and communal coping scores were significantly correlated (rs = .44 to .82, ps < .05). Both patients and spouses showed increases in *we*-talk (F = 43.00, p < .001) and communal coping behavior (F = 61.94, p < .001) from a "baseline" problem-focused therapy block to the "active" solution-focused therapy block. Partner increases in *we*-talk were of similar magnitude, whereas patients showed greater increases in communal coping behavior than spouses (F = 6.26, p = .02). Preliminary findings also suggest that within-session increases in spouse communal coping behaviors (accounting for baseline levels) predict successful patient treatment outcomes (B = 1.09, p = .02). Results highlight communal coping as a potential mechanism of action in couple-focused interventions for health problems.

Symposium 31B

LINKS OF PATIENT AND SPOUSE COMMUNAL APPRAISALS TO RELATIONAL AND HEALTH OUTCOMES

Vicki Helgeson, PhD

We investigated diabetes appraisals by asking patients with type 1 diabetes and their spouses (n = 143 couples) separately whether they perceived diabetes to be the patient's problem or a shared problem (i.e., communal). Patients were 61% female, average age 46 (range 25-75 yrs), and 95% Non-Hispanic White. Patients completed online questionnaires that assessed diabetes distress, self-care behavior, and reports of supportive and unsupportive behavior from spouses. Whereas 71% of spouses said that diabetes was a shared problem, only 26% of patients said diabetes was shared. Those who scored high on independence centrality (i.e., preferences for independence in handling illness) were less likely to report communal appraisals (p < .01). Although patient communal appraisal was unrelated to self-care behavior, spouse communal appraisal was marginally related to better patient self-care behavior (p = .10). Patient communal appraisals were related to lower diabetes distress ($p < .05$) and overall higher marital quality ($p < .05$). Patient communal appraisals also were related to greater receipt of emotional support, instrumental support, and collaboration with spouses (all p's < .05). Spouse communal appraisals were related to lower patient regimen distress, and patient receipt of greater emotional support, instrumental support, and collaboration (all p's < .05). We also investigated whether patient appraisals altered the relation of support to outcomes, focusing on self-care behavior and diabetes distress. There was some evidence of stronger associations among patients who held communal versus noncommunal appraisals. For example, emotional support was related to better self-care when patients perceived diabetes as shared ($r = .48$, $p < .05$) but unrelated to self-care when they did not ($r = .11$, n.s.), z = 2.09, $p < .05$. Instrumental support was related to reduced diabetes distress when patients appraised the illness as shared ($r = .35$, $p < .05$) but unrelated to distress when they did not ($r = .06$, n.s.), z = 2.15, $p < .05$. These results suggest that communal illness appraisals might enhance patient outcomes and optimize the support process.

Symposium 31C

PARENTAL INVOLVEMENT IN EMERGING ADULTS' DAILY DIABETES MANAGEMENT

Caitlin Kelly, M.A.

Little is known about parental involvement with type 1 diabetes (T1D) management during emerging adulthood. In late adolescence, parental involvement with T1D occurs via diabetes information-sharing (disclosure to parents, parental solicitation). Parents may be less involved in daily diabetes management as emerging adults move out of the parental home, but diabetes care may still benefit from parents' involvement. The goal of this study was to examine the daily frequency of emerging adults' disclosure and parental solicitation of diabetes-related information, the link between parental involvement and T1D management, and whether these processes differed among participants who lived in the parental home versus those who did not. Emerging adults with T1D ($N = 212$; $M_{\text{age}} = 18.81$; 64.5% female) reported daily for 14 days on parents' involvement with diabetes care (disclosure to parents, parents' solicitation of information, parents' knowledge of T1D management, frequency and type of parental contact) one year after their senior year of high school. Across the 14 days, 63.8% of participants reported contact with their mothers and 46.3% reported contact with their fathers. Participants reported their parents knew only "a little bit" about their daily management on average (M_{mother} = 2.03; M_{father} = 1.70 on a 5-point scale). Participants who lived outside of the parental home reported lower levels of parental contact (M_{diff} mother = -2.64; M_{diff} father = -1.44), solicitation (M_{diff} mother = -.11; M_{diff} father = -.09), knowledge (M_{diff} mother = -.63; M_{diff} father = -.49), and mothers', but not fathers', helpfulness (M_{diff} = -.63) (all *p's* < .05). No differences emerged for disclosure of diabetes-related information. Notably, when parental involvement did occur, it was associated with improved management, regardless of whether or not participants lived in the parental home. When mothers solicited information and emerging adults disclosed diabetes-related information, adherence increased ($p < .05$). This suggests that, although the frequency of parental involvement may decrease in emerging adulthood, especially after leaving the parental home, parents are still an important source of support for diabetes management.

Symposium 32 1:30 PM-2:45 PM

IDENTIFYING AND PREVENTING EATING DISORDERS AS A WAY TO DECREASE OBESITY IN PRIMARY CARE

Jessica Y. Breland, PhD[1], Rebecca K. Blais, PhD[2], Shira Maguen, Associate Professor/Ph.D.[3], Niloofar Afari, PhD[4]

[1]VA Palo Alto & Stanford University School of Medicine, Menlo Park, CA; [2]Utah State University, Logan, UT; [3]San Francisco VA Medical Center and University of California, San Francisco, San Francisco, CA; [4]University of CA, San Diego & VA San Diego Healthcare System, La Jolla, CA

Disordered eating is fairly common in military and veteran populations, but eating disorder identification and prevention in this population is hampered by the lack of screening tools regularly utilized in primary care, as well as a dearth of information on how different military stressors impact eating disorder risk. To address this gap, the first presentation used cross-sectional data from 407 women veterans to determine the associations between combat exposure, military sexual trauma (MST), and eating disorders. The authors found that MST, but not combat exposure, was significantly associated with eating disorders (OR: 2.03; CI: 1.03-3.98). Asian race was also associated with increased risk (OR: 3.36; CI: 1.26-8.97), suggesting these factors are important prevention/intervention moderators. The second presentation examined the longitudinal association between MST and eating disorders among 595,525 Iraq/Afghanistan veterans enrolled in VA care, and whether this association varied by sex. At one and five years, administrative data demonstrated that risk for eating disorders was nearly two times higher among those with a positive screen for MST (1-year adjusted odds ratio [AOR]: 1.99; CI: 1.57-2.40 and 5-year AOR: 1.86; CI: 1.49-2.32). Male veterans with a history of MST were at differentially greater risk for eating disorders than women with a history of MST in the 1-year cohort only (AOR: 2.13; CI: 1.01-4.50). The third presentation reviewed the utility of two existing and one newly proposed eating disorder screens in primary care. Data were examined in a cohort of 407 women veterans, and positive and negative predictive values for binge eating disorder, bulimia, and anorexia were determined for each screen. The authors determined that one new and one existing screen outperformed a primary-care specific eating disorder screen. Efforts to identify and treat eating disorders among male and female veterans should focus on veterans who report MST, including men with MST. Having a strong screening tool in primary care can help identify veterans who report eating disorder symptoms, thereby assisting with early intervention and prevention of obesity as well as other weight-related health problems.

Symposium 32A

MILITARY SEXUAL TRAUMA: A UNIQUE EATING DISORDER RISK FACTOR

Jessica Y. Breland, PhD

Background. Eating disorders are more common among veterans than other populations, suggesting that military service affects eating habits. However, efforts to prevent or reduce eating disorders and obesity are hampered by a lack of information on how different military stressors affect eating disorder risk.

Objective. To determine whether military sexual trauma and combat exposure are independent predictors of eating disorders among a high-risk group: women veterans.

Methods. Women veterans (N=407) who used VA care completed self-report questionnaires assessing demographics, presence of current eating disorders (using the Eating Disorder Examination Questionnaire and SCOFF), history of military sexual trauma, history of combat exposure, depression (using the PHQ-9), and post-traumatic stress disorder (using the PCL-5). We used logistic regression to predict the presence of any eating disorder (anorexia or bulimia nervosa, or binge eating disorder) as a function of military sexual trauma and combat exposure, adjusting for demographic variables. As in past, published work we did not use mental health conditions as predictors, given overlap in symptoms and unknown times of onset.

Results. Sixty-three women (15%) met eating disorder criteria, mostly for binge eating disorder (N=47), 270 women (66%) reported military sexual trauma, and 130 women (32%) reported combat exposure. Mean age was 49 years (SD=13); 40% of women were veterans of color. Women who reported military sexual trauma had twice the odds of having an eating disorder compared to women who did not (OR: 2.03; CI: 1.03-3.98). Combat exposure was not associated with eating disorders. Of all demographics, only Asian race was associated with eating disorders. Asian women had much higher odds of having an eating disorder than white women (OR: 3.36; CI: 1.26-8.97).

Conclusion. Women in this study reported high rates of eating disorders and military sexual trauma compared to past research, highlighting the importance of screening. For efficient implementation, screening programs could focus on women reporting military sexual trauma and, possibly, race. Given associations among eating disorders, obesity, and mortality, such efforts could greatly improve veteran health.

Symposium 32B

MILITARY SEXUAL TRAUMA IS ASSOCIATED WITH INCREASED RISK FOR EATING DISORDERS AMONG AFGHANISTAN AND IRAQ VETERANS

Dr. Rebecca K. Blais, PhD

Military sexual trauma (MST) and eating disorders (ED) are underestimated public health concerns in Veterans, particularly in males. The association between MST and ED, and whether this association varies by sex, is not well understood. The current study evaluated whether MST screen status was associated with increased risk for ED in 595,525 Iraq/Afghanistan Veterans within 1- and 5-years after initiating Veterans Health Administration (VHA) care, and whether the association between MST and ED varied by sex. Three percent (*n*=18,488) screened positive for MST. At 1- and 5-year follow up, 0.1% (*n*= 513, 74% female), and 0.2% (*n*= 504, 71% female) were diagnosed with ED. In regression models adjusted for demographic, military service and psychiatric comorbidities, risk for ED was nearly 2 times higher among those with a positive screen for MST in the 1-year (adjusted odds ratio [AOR]=1.94, 95% confidence interval [CI]=1.57-2.40) and 5-year (AOR=1.86, 95% CI=1.49-2.32) cohorts. Male Veterans with a history of MST were at differentially greater risk for ED than women with a history of MST in the 1-year cohort only (AOR=2.13, 95%CI=1.01-4.50). A positive screen for MST, particularly in male Veterans, is independently associated with nearly a 2-fold increased risk for ED. Both MST and ED are historically considered problems that mainly impact women; however, current results suggest that it is critical to screen for ED in both men and women Veterans, especially in those who report MST. Early detection and intervention may reduce the negative sequelae of both MST and ED thereby resulting in more positive post-deployment adjustment.

Symposium 32C

DISCRIMINATIVE ACCURACY OF A NEW SCREENING INSTRUMENT FOR EATING DISORDERS IN VETERANS

Dr. Shira Maguen, Associate Professor/Ph.D.

Although there is evidence that eating disorders are more prevalent in veterans than in the general population, veterans are not routinely screened for eating disorders in primary care. The goal of this study was to develop an eating disorders screening instrument for veterans in primary care and compare it to existing screening instruments. Existing instruments were developed prior to Binge Eating Disorder (BED) becoming a formal diagnosis and have not been validated with veteran populations. Prevalence rates of BED, Bulimia Nervosa (BN), Anorexia Nervosa (AN) and Any Eating Disorder (AED) were obtained in a sample of 407 females who completed the Eating Disorder Examination Questionnaire (EDE-Q), the self-report version of the Eating Disorder Examination, considered the gold-standard for diagnosing eating disorders. To assess the discriminative accuracy of the new screening instrument, participants completed the new screener, as well as two existing screeners, the Eating Disorders Screen for Primary Care (EDS-PC), and the SCOFF screen. EDE-Q prevalence rates of probable eating disorders in our sample were 12% for BED, 2.2% for BN, 2% for AN, and 16% for AED. The sensitivity, specificity, receiver operating characteristic curve (ROC), and positive and negative predictive values of the new screener for BED, BN, AN, and AED were compared to those of the EDS-PC and the SCOFF. The new screener correctly classified 87.2% (CI: 74.3%-95.2%) of BED cases, all cases of BN and AN, and 90.5% (CI: 80.4%-96.4%) of cases with AED. This discriminative power was higher than that of the SCOFF, which correctly identified 69.6% (CI: 54.2%-82.3%) of BED, 77.8% (CI: 40.0%-97.2%) of BN, 37.5% (CI: 8.52%-75.5%) of AN, and 66.1% (CI: 53%-77.7%) of AED. While the EDS-PC had slightly higher sensitivity than the new instrument, the new screener had much better specificity. ROC results showed that the new instrument was better able to distinguish cases from non-cases than the EDS-PC (e.g., 0.740; CI: 0.695-0.785 vs. 0.684; CI: 0.649-0.72 for AED). The new screener outperformed the SCOFF in classifying true cases, outperformed the EDS-PC in classifying true non-cases, and outperformed the EDS-PC in distinguishing cases from non-cases of BED, BN, AN and AED. The new screener can be used in primary care to help detect BED and other eating disorders among veterans, supporting early intervention efforts as well as the prevention of obesity and other weight-related health issues.

Symposium 33 1:30 PM-2:45 PM

STIGMA AND SUBSTANCE USE: IMPLICATIONS FOR RESEARCH, PRACTICE, AND POLICY

Valerie A. Earnshaw, PhD[1], Kristi E. Gamarel, PhD, EdM[2], H. Jonathon Rendina, PhD, MPH[3], John F. Kelly, PhD[4], Laramie R. Smith, PhD[5]

[1]University of Delaware, Newark, DE; [2]Brown University School of Public Health, Providence, RI; [3]Hunter College of the City University of New York (CUNY), New York, NY; [4]Mass. General Hospital/Harvard Medical School, Boston, MA; [5]University of California San Diego School of Medicine, La Jolla, CA

Researchers, clinicians, and policy makers are increasingly recognizing the role of stigma (social devaluation and discrediting) in substance use epidemics. Stigma can lead to substance use and misuse among people living with a range of socially devalued characteristics (e.g., sexual minority orientation, chronic illnesses including HIV), and undermine the treatment and wellbeing of people living with substance use disorders. To date, efforts to address the role of stigma in substance use have met limited success. This symposium brings together cutting-edge research to foster greater understanding of associations between stigma and substance use across the lifespan, and discuss ways that this research could be translated to impact practice and policy aimed at improving the wellbeing of people at risk of or living with substance use disorders. The first two talks will present studies exploring ways in which stigma leads to greater substance use, including greater cigarette susceptibility among sexual minority youth, and greater use of alcohol, marijuana, and other drugs among people living with HIV. The third talk will present a study exploring ways in which stigma associated with substance use undermines the wellbeing of people living with HIV. Together, these talks advance research on stigma and substance use by drawing on advanced methodologies (e.g., ecological momentary assessment, moderation and mediation analyses), addressing stigma associated with a range of characteristics (i.e., sexual minority status, HIV, substance use), investigating different experiences of stigma (i.e., enacted and internalized stigma), examining several types of substance use (i.e., cigarette, alcohol, marijuana, and other drug use), and exploring different stages of the lifespan (i.e., youth, adulthood). The final talk will present a systematic review of the empirical literature on stigma and substance use and introduce a theoretical framework linking stigma with substance use. Discussion will be led by a researcher and clinician in the field of addiction medicine, and will focus on future directions for research, practice, and policy related to stigma and substance use.

Symposium 33A

SUBSTANCE USE STIGMA AMONG PEOPLE LIVING WITH HIV

Dr. Valerie A. Earnshaw, PhD

People with substance use disorders (SUDs) experience pronounced stigma from others. Although research has largely focused on experiences of SUD stigma from healthcare workers, recent qualitative work suggests that enacted SUD stigma (i.e., experiences of discrimination associated with SUDs in the past or present) from family members is particularly distressing. The current study builds on this work by quantitatively examining enacted SUD stigma from family members and healthcare providers using the Substance Use Stigma Mechanisms Scale. Eighty-five people living with HIV who reported current substance use or a history of problematic substance use were recruited from a community clinic. Participants reported histories of alcohol (87.1%), marijuana (72.9%), cocaine (62.4%), crack (42.4%), and opiate (43.5%) use. Approximately one-third (35.1%) reported a history of opioid replacement therapy. Participants reported more frequent experiences of enacted SUD stigma from family members than from healthcare providers [t(83)=12.81, p<0.001]. Regression-based analyses conducted with the PROCESS macro demonstrate that enacted SUD stigma from family members [B(SE)=0.43(0.21), p=0.04], but not healthcare providers [B(SE)=-0.12(0.38), p=0.77], is associated with greater depressive symptoms even after controlling for internalized SUD stigma and socio-demographic characteristics related to depressive symptoms. Moreover, enacted SUD stigma from family members is associated with decreased motivation to engage in HIV care via the mediator of greater depressive symptoms [indirect effect (SE)=-0.79(0.42), CI=-0.12, -1.99]. Findings lend support to previous qualitative work suggesting that enacted SUD stigma from family members may be more detrimental than enacted SUD stigma from healthcare providers, and further suggest that enacted SUD stigma from family members may impact motivation to engage in health behaviors, including those associated with HIV.

Symposium 33B

THE ROLE OF DISCRIMINATION IN CIGARETTE SUSCEPTIBILITY AMONG SEXUAL MINORITY YOUTH

Dr. Kristi E. Gamarel, PhD, EdM

Background: Sexual minority youth are more likely to smoke cigarettes compared to their heterosexual counterparts. However, less is known about sexual orientation differences in smoking susceptibility (i.e., willingness to use cigarettes if offered by friends), which in an important precursors to initiation that is necessary to guide prevention programs.

Discrimination has been consistently associated with substance use and may serve as contributing factor in understanding disparities in cigarette susceptibility among sexual minority youth. The purpose of this study was to examine the potential role of perceived discrimination on the association between sexual orientation and cigarette susceptibility.

Methods: The sample was 443 youth (26.6% sexual minority, 59.5% female, 72.0% White, M_{age} = 16.7 years) enrolled in a prospective study of substance use initiation and progression. Participants self-reported their sexual identity and attraction, everyday discrimination experiences, cigarette susceptibility (i.e., willingness to use if offered by a group of friends), and whether they had ever smoked.

Results: Accounting for sociodemographic variables, multivariate linear regression models revealed that sexual minority youth were significantly more likely to report cigarette susceptibility compared to their heterosexual counterparts (B=0.11, SE=0.06, $p<0.05$), but discrimination was not associated with sexual minority status or cigarette susceptibility. Discrimination moderated associations between sexual orientation and susceptibility (B=0.01, SE=0.00, $p<0.05$), such that discrimination was associated with greater cigarette susceptibility for sexual minority youth, but not among their heterosexual counterparts.

Conclusions: Peers may play a critical role in decisions about cigarette use for sexual minority youth, and discrimination may be a contributing factor in explaining cigarette susceptibility among sexual minority adolescents. Future research and prevention programs which target stigma and peer contexts will be discussed to guide effective tobacco control and prevention for sexual minority adolescents.

Symposium 33C

THE CRITICAL INFLUENCE OF DAILY EXPERIENCES OF INTERNALIZED HIV STIGMA ON SUBSTANCE USE AMONG HIV-POSITIVE GAY AND BISEXUAL MEN

Dr. H. Jonathon Rendina, PhD, MPH

Background: Research has shown associations between levels of HIV stigma and substance use outcomes such as overall frequency of use. However, the co-occurrence of event-level HIV stigma and substance use has rarely, if ever, been examined.

Method: We analyzed 666 daily reports of 47 HIV-positive gay and bisexual men (GBM) collected as part of a three-week prospective online diary study. We utilized multilevel logistic models to predict daily use of stimulants, marijuana, and heavy drinking (separate models). Models were fit with an AR(1) covariance structure and random intercept, and adjusted for day of diary cycle, whether the report was on a weekend, time since HIV diagnosis, race, relationship status, and age. Measures of HIV-related forms of internalized stigma (e.g., guilt, shame) and anticipated/social stigma (e.g., wanting to hide, worry about judgement) were given daily. These daily measures were disaggregated into individual-level averages and situational fluctuations around those averages and used to predict daily ART non-adherence.

Results: The sample was diverse with regard to race/ethnicity (75% men of color), employment status (58% unemployed), and educational background (68% less than college). Mean age was 38 years (*Mdn*=33.5) and mean years since diagnosis was 10 (*Mdn*=9). Overall, stimulant use was reported on 13.2% of days, marijuana on 23.7%. and heavy drinking on 9.0%. Daily increases in internalized HIV stigma were associated with substantially increased odds of both stimulant use (AOR = 7.67, $p < 0.001$) and heavy drinking (AOR = 3.89, $p = 0.01$), but was not significantly associated with marijuana use (AOR = 1.34, $p = 0.49$); daily fluctuations in anticipated/social stigma were not significantly associated with stimulant use (AOR = 0.76, $p = 0.47$), heavy drinking (AOR = 0.64, $p = 0.27$), or marijuana use (AOR = 0.89, $p = 0.74$).

Conclusions: Fluctuating levels of internalized HIV stigma (e.g., guilt, shame) from day-to-day were associated with significantly higher odds of stimulant use and heavy (i.e., binge) drinking, even after adjusting for daily fluctuations in social stigma as well as individual-level measures of both forms of stigma (i.e., average tendencies to experience each form of stigma). Mobile interventions that can be designed to recognize and intervene upon increases in internalized HIV stigma may provide meaningful improvements in substance use outcomes for HIV-positive GBM.

Symposium 33D

STIGMA AND SUBSTANCE USE: A SYSTEMATIC REVIEW AND THEORY-BUILDING PROCESS MODEL

Dr. Laramie R. Smith, PhD

The deleterious health effects of stigma and substance use are well documented; however, the process by which stigma and substance use work to undermine health and well-being is understudied. Stigma may both lead to increased substance use and risk for developing substance use disorders (SUDs), as well as undermine the health and treatment of those living with SUDs. We conducted a systematic review of the extant literature on stigma and substance use to assess the evidence for a process by which social stigma influences both substance use and substance use-related health outcomes. Through this review, we evaluate the ways in which various social stigmas (e.g., sexual orientation, race/ethnicity, mental illness, incarceration history) place members of these stigmatized groups at increased risk of developing a SUD. We further evaluate how stigma associated with SUDs, once acquired, undermine the health of people living with SUDs including their engagement in the SUD diagnosis, treatment, and recovery process. In this theory-building process, we examine ways stigma associated with SUDs and other stigmatized characteristics manifest at the structural (e.g., criminalization laws), interpersonal (i.e., persons who stigmatize), and intrapersonal (i.e., persons who are stigmatized) levels. We also examine how intrapersonal manifestations of stigma (e.g., enacted, anticipated, internalized) affect substance use and treatment behaviors, and ways such relationships may be mediated by internalizing (e.g., depression, anxiety) or externalizing (e.g., aggression, sensation seeking) psychosocial mechanisms. We further assess the available research examining resilience resources (e.g., housing policies, social support, positive coping strategies) that may moderate the relationship between stigma and negative substance use outcomes. Discussion will focus on evaluating the depth and quality of available research on policies and translational practices that serve to reinforce or buffer against the effects of stigma on substance use-related outcomes.

Symposium 34 1:30 PM-2:45 PM

BREAST DENSITY AND MANDATED DENSITY NOTIFICATIONS: RACIAL DIFFERENCES AND OPPORTUNITIES FOR INTERVENTION

Mark A. Manning, PhD[1], Suzanne O'Neill, PhD[2], Kristen S. Purrington, PhD, MPH[3], Sara J. Knight, PhD[4]

[1]Karmanos Cancer Institute/Wayne State University School of Medicine, Detroit, MI; [2]Georgetown University, Washington, DC; [3]Wayne State University School of Medicine, Detroit, MI; [4]University of Alabama at Birmingham, Birmingham, AL

Breast density (i.e., ratio of fibroglandular to fatty breast tissue) is one of the strongest risk factors for breast cancer. Over half of US states have implemented mandatory breast density notification laws to inform women of their density status. Millions of women receive density notifications each year, even as specific follow-up guidelines remain elusive and as the medical/epidemiological evidence base regarding breast density as a cancer risk factor continues to develop. Much remains to be clarified when it comes to breast density-attributed breast cancer risk, particularly regarding racial differences in the magnitude of risk. Further, we know little regarding women's reactions to receiving breast density notifications, particularly regarding racial differences in psychological and behavioral responses to receiving the notifications, or regarding potential interventions that utilize breast density notifications to reach women in need of guideline-informed care. We present data from three separate breast density studies to address these questions. The first speaker will present data showing between-race differences in the distribution of breast density and corresponding breast cancer risk for African American and European American women. The second speaker will present data elucidating between-race differences in psychological responses and decision making processes following receipt of breast density notifications. The third speaker will present data on the acceptability and efficacy of a web-based decision support intervention for women with clinically elevated breast cancer risk due to breast density and other risk factors, such as family history. The transdisciplinary session will conclude with a panel discussion led by our discussant, identifying unifying themes related to the state of breast density research, dissemination of breast density information and decision-making following receipt of notifications.

Symposium 34A

BETWEEN-RACE DIFFERENCES IN DECISION MAKING RELATED TO PHYSICIAN COMMUNICATION FOLLOWING BREAST DENSITY NOTIFICATION

Dr. Mark A. Manning, PhD

Background: A number of states have enacted laws mandating disclosure of dense breasts to women via their mammogram reports; however, no studies have examined women's psychological and behavioral responses to receiving notifications. Additionally, no one has examined how between-race (African American vs. European American) differences in relevant cognition and emotion are related to psychological and behavioral responses to receiving BD notifications. Guided by the theory of planned behavior, we examined how women's knowledge, emotions and perceptions of discrimination influence their intentions and behaviors related to discussing recently received density notifications with their physicians.

Methods: We sent survey invitations to screen negative African American and European American women within two weeks of their screening mammograms. Consenting women completed measures assessing demographic variables (e.g., age, income, education, and marital status), breast density and breast cancer risk knowledge, breast density anxiety, breast cancer worry, perceptions of group-based medical mistrust, perceptions of discrimination, and attitudes, norm, control perceptions and intentions towards talking to physicians about their breast density notification. Three months later, we sent women a follow-up survey assessing whether they talked to their physicians about the breast density notifications. We used path models to examine the influence of cognition, emotion and perceptions of discrimination on women's behavior, mediated by the cognitive processes implied by the theory of planned behavior.

Results: African American women had stronger intentions to discuss their breast density notifications with their physicians; however, there were no between-race differences in actual behaviors. Nonetheless, there were significant between-race differences in the processes that lead to behavior. Intentions predicted behaviors for European American women, but not for African American women. Rather, cognition, emotion and perceptions of discrimination had significant direct effects on behaviors for African American women.

Conclusion: These data suggest that there are significant between-race differences in the cognitive processes related to physician communication among women who receive breast density notification.

Symposium 34B

PRELIMINARY FINDINGS OF A DECISION SUPPORT TOOL FOR WOMEN WITH DENSE BREASTS

Suzanne O'Neill, PhD

Background: Mammographic breast density is one of the strongest risk factors for breast cancer. Mandatory density disclosure policies are increasing nationally without established best practices or evidence of clinical benefit. Density disclosure could serve as an opportunity to communicate with women with clinically elevated risk for breast cancer. Guided by Protection Motivation Theory and the RE-AIM framework, we are testing a personalized, web-based breast cancer risk communication and decision support tool for women with dense breasts whose elevated cancer risk makes them eligible to consider guideline-informed risk management (chemoprevention, breast MRI).

Methods: We have engaged multiple stakeholders within an integrated healthcare system throughout the tool development and trial planning process (patient focus groups and usability pre-testing; health care provider and delivery system leader interviews). We are currently pilot testing the tool with 20 women in our target population prior to trial launch in January 2017. Pilot outcomes will include knowledge, perceived breast cancer risk and severity, cancer worry, intentions for screening and chemoprevention and the response cost and response efficacy of these risk management options.

Results: Focus group results suggested that most women were aware of breast density, but unfamiliar with its role as a breast cancer risk factor. Participants in usability pre-testing rated the tool highly on acceptability and ease of use. Health care providers and clinical leaders highlighted key areas for provider engagement prior to the trial's launch, such as clarifying pathways for referral and monitoring of clinical impact within the health system. Results of pretesting and preliminary experiences with the larger trial will be shared in the symposium.

Conclusions: Preliminary results suggest acceptability of our web-based tool by patients and providers within an integrated healthcare system.

Symposium 34C

RACIAL DIFFERENCES IN BREAST DENSITY DISTRIBUTION AND CANCER RISK IN AN URBAN HOSPITAL-BASED COHORT

Kristen S. Purrington, PhD, MPH

Breast density (BD) is a strong risk factor for BC (BC). Women with the highest density (≥75%) are at a 4.6-fold increase in risk of BC compared to women with the lowest density (≤5%). BD and associated BC risk has not been well studied for African American (AA) women. Among studies that reported data for AA women, results are conflicting on whether AA women tend to have higher or lower BD than white women or whether the BC risks associated with BD are the same these two groups. We conducted a retrospective study to explore racial differences BD patterns and resulting cancer risk at the Karmanos Cancer Center Imaging Department. We have currently abstracted BI-RADS BD (a: almost entirely fatty, b: scattered fibroglandular density, c: heterogeneous fibroglandular density, d: extremely dense) from radiology reports for 16,167 out of 20,699 women (82% AA; 18% white) who underwent routine mammographic screening from 2012-2014. Subsequent BCs as well as previous history of BC were determined by linkage with the Metropolitan Detroit Cancer Surveillance System database as well as radiology records. BI-RADS BD and volumetric BD estimates from Volpara Research software were also obtained for an additional 5,484 women for whom raw mammogram images were available. The overall distribution of BD was significantly different for white and AA women, where AA women were less likely than white women to have scattered [Odds ratio (OR)=0.79, 95% confidence interval (CI) 0.71-0.89], heterogeneous [OR=0.73, 95% CI 0.62-0.86], or entirely dense breasts [OR=0.62, 95% CI 0.47-0.82] compared to fatty breasts, adjusted for age and body mass index (BMI). Similarly, although increasing BD is associated with an increase in BC risk for both AA and white women, the effects of BD adjusted for age were stronger for AA [Scattered vs fatty: OR=2.23; Heterogeneous/dense vs fatty: OR=3.65] compared to white women [Scattered vs fatty: OR=1.14; Heterogeneous/dense vs fatty: OR=1.58]. Data were sparse for white BC cases and for women with entirely dense breasts. We also explored changes in BI-RADS BD over time and the agreement between BI-RADS and volumetric BD. Among 1,884 women who had 2 mammograms within 2 years, 521 (27.6%) were assigned a different BI-RADS classification at each time point and 185 (9.8%) of these women were assigned a category that would shift them from being considered to have dense vs. non-dense breasts. Similarly, 46.4% of women were assigned to a different BI-RADS classification using volumetric breast density vs subjective assessment, and 12.1% were assigned a category that would shift them from being considered to have dense vs. non-dense breasts. These data confirm that BD definitions are subjective and dependent on the measurement tool, which has implications for recently implemented BD notification laws across the United States.

Symposium 35 1:30 PM-2:45 PM

RELIGIOUSNESS/SPIRITUALITY AND HEALTH BEHAVIORS ACROSS THE CANCER CONTINUUM

Crystal L. Park, PhD[1], John M. Salsman, PhD[2], Crystal L. Park, PhD[1], Melinda Stolley, MA, PhD[3], Cheryl L. Holt, PhD[4], Sarah D. Mills, MS, MPH[5]

[1]University of Connecticut, Storrs Mansfield, CT; [2]Wake Forest School of Medicine, Winston Salem, NC; [3]Medical College of Wisconsin, Milwuakee, WI; [4]University of Maryland, College Park, MD; [5]San Diego State University/University of California, San Diego Joint Doctoral Program in Clinical Psychology, Los Angeles, CA

Spirituality has been shown in many studies to be fairly consistently related to mental and physical health (see Koenig, 2012 for a review), but the mechanisms explaining these linkages are not well-understood. Many different pathways of influence have been proposed, but few have been tested. Adding complexity, spirituality comprises many different dimensions, including beliefs, behaviors, motivation, emotions, and relationships, and each may relate differently to health. One important but understudied pathway is that of health behaviors. This symposium focuses on how different dimensions of spirituality may link with health behaviors across the cancer continuum, from healthy populations to those at higher risk of certain cancers to cancer survivors. Sarah Mills will describe relationships between beliefs about religious influences on health and health behaviors in a sample of churchgoing Latina women. Cheryl Holt will present results of a national longitudinal study of African American adults examining whether religious social support mediates relationships between multiple aspects of religious involvement and cancer control behaviors in African Americans. Melinda Stolley will present results of a study of relationships between religiosity/spirituality and health behaviors in minority adult childhood cancer survivors compared to White childhood cancer survivors and to non-cancer controls. Crystal Park will discuss relationships between multiple dimensions of spirituality and health behaviors in survivors of breast cancer, focusing on potential negative as well as positive links. Our discussant, John Salsman, an expert in spirituality and health, will draw out common themes across the presentations, focusing on the mechanisms that may account for these linkages.

Symposium 35A

DIMENSIONS OF SPIRITUALITY ARE DIFFERENTIALLY ASSOCIATED WITH DIET AND PHYSICAL ACTIVITY IN BREAST CANCER SURVIVORS

Dr. Crystal L. Park, PhD

Health behaviors, while important for everyone in terms of morbidity and mortality risks, are especially important for cancer survivors, who are at heightened risk not only for recurrence and additional primary cancers, but also for other conditions such as metabolic syndrome and cardiovascular disease. Some psychosocial factors, such as social support and self-efficacy, have been identified as promoting healthful lifestyles, but much remains to be learned. One potentially important factor, spirituality, has been suggested as promoting better health, but few studies have examined these associations. The present study investigated links between three dimensions of spirituality (behaviors, beliefs, and identity) and health behaviors in a sample of 172 recent survivors of breast cancer enrolled in a lifestyle change intervention. Present analyses are from baseline surveys completed prior to randomization. Participants were primarily white (93%), married (73%), and well-educated (74% had a college degree or higher); mean age was 54 (SD = 10). Results of hierarchical multiple regression analyses controlling for age and education indicated that frequency of service attendance was related to less moderate/vigorous physical activity while frequency of private prayer was related to consumption of more fruits and vegetables (but not total calories consumed). Degree of identity as religious was negatively related to moderate/vigorous activity and higher BMI but also with lower total calorie consumption. Beliefs in God were unrelated to health behaviors, but belief in an afterlife was related to less moderate/vigorous physical activity and higher BMI. These results suggest that spirituality has some complex but potentially important associations with health behaviors in breast cancer survivors. Further, different dimensions have different effects and many of these effects are in an unexpectedly adverse direction. More research is needed to understand these relationships and to determine how spiritual dimensions may play a useful role in lifestyle change interventions.

Symposium 35B

SPIRITUALITY AND HEALTH BEHAVIORS IN ADULT MINORITY CHILDHOOD CANCER SURVIVORS

Melinda Stolley, MA, PhD

Background. Over 75% of childhood cancer patients survive long-term yet over 60% of survivors will experience adverse late effects including cardiovascular disease (CVD), osteoporosis and secondary cancers. Practicing healthy lifestyles is important and may be particularly salient for African-American and Hispanic survivors given increased risk for chronic disease. Few studies have examined health behaviors in minority childhood cancer survivors (CCS) and fewer still have examined correlates of health promoting behaviors outside of demographic factors. This presentation examines spirituality and health behaviors in a diverse cohort of adult CCS and non-cancer controls.

Methods. The Chicago Healthy Living Study was a cross sectional study with 450 adult CCS (n=150 African-American, 152 Hispanic, 150 white) recruited via Chicago area hospital cancer registries and 375 racial/ethnic matched controls recruited via targeted digit dial. Participants completed a one-time 2-hour interview with validated measures of body mass index (BMI), health behaviors (diet, physical activity, smoking, alcohol use) and the brief Systems of Belief Inventory (SBI-15). Analyses adjusted for age, sex and SES examined differences in health behaviors and spirituality within racial/ethnic groups between CCS and controls and between racial/ethnic groups within CCS. We also explored associations between spirituality and obesity, current smoking and adherence to dietary (percent calories from fat and saturated fat, sodium, calcium) and physical activity recommendations (150 weekly mins of moderate activity).

Results. Overall BMI and health behaviors were similar between CCS and controls across racial/ethnic groups. Within CCS, minority survivors were more likely to be obese and not adhere to dietary recommendations. Spirituality was similar between CCS and controls among African-Americans and whites, but Hispanic CCS' SBI scores were higher than controls (p<.005). Within survivors, spirituality was highest among African-Americans followed by Hispanics and then whites (p<.001). Initial analyses show no association between spirituality and health behaviors among CCS, but sub-group analyses may reveal more.

Discussion. Spirituality was highest among minority survivors, yet there were no associations with adherence to healthy lifestyle behaviors. Other factors such as knowledge, perceived risk or engagement in long-term follow-up care may be more relevan to health behaviors, whereas spirituality may be more tied to quality of life in this populaiton. Understanding correlates of health behaviors among this high risk group will help to inform the development of relevant interventions.

Symposium 35C

DOES RELIGIOUS SOCIAL SUPPORT MEDIATE THE RELATIONSHIP BETWEEN RELIGIOSITY AND CANCER CONTROL BEHAVIORS IN AFRICAN AMERICANS?

Dr. Cheryl L. Holt, PhD

Abundant research has examined the association between religious involvement and health-related outcomes. Additional research has examined reasons for this “religion-health connection”, including studies testing theoretical models that cover a variety of potential explanatory mechanisms. However, most of this research has been cross-sectional in nature. Given the relatively high levels of religious involvement among African Americans and research suggesting that faith communities provide a unique form of religious social support that may impact health, the present study aimed to test a model of religious social support as a mediator of religious involvement and a variety of cancer control behaviors in a national sample of African Americans. The RHIAA (Religion and Health In African Americans) study conducted three waves of telephone interviews with N=3173 African Americans over a 5-year period. N=766 participants provided data at all three waves. Measurement models were fit to the data followed by longitudinal structural models. Religious *beliefs* were not associated with a change in religious social support over time. However, religious *behaviors* (e.g., church attendance) were associated with a significant increase in religious social support over time. Religious social support was associated with decreased binge drinking and vegetable consumption, and increased reports among men of receiving prostate cancer screening. There was no evidence of a mediation effect of religious social support in the association between religious *beliefs* and health-related outcomes. However, the relationship between religious *behaviors* and decreased binge drinking over time was mediated by increases in religious social support. Implications for theory and practice are discussed.

Symposium 35D

THE PERCEIVED RELIGIOUS INFLUENCE ON HEALTH BEHAVIOR SCALE AND THE ILLNESS AS PUNISHMENT FOR SIN SCALE AMONG CHURCHGOING LATINAS

Ms. Sarah D. Mills, MS, MPH

The present study 1) evaluated the psychometric properties of the Spanish versions of the Perceived Religious Influence on Health Behavior scale, a measure of the extent to which an individual’s health behaviors are affected by his or her religion, and the Illness as Punishment for Sin scale, a measure of the extent to which illness is believed to be an act of retribution, and 2) examined how these measures relate to health behaviors (i.e., physical activity, food/beverage consumption, mammography screening, sleep), in a sample of churchgoing Latina women (*N* = 404). For the Perceived Religious Influence on Health Behavior scale, confirmatory factor analysis provided support for the expected one-factor model, internal consistency reliability was good, and there was evidence of convergent validity. For the Illness as Punishment for Sin scale, confirmatory factor analysis provided support for the expected one-factor model, but on a revised, seven-item version of the measure. Internal consistency reliability for this revised version was good, but evidence of convergent validity was mixed. For the second aim, no significant relationships ($p > .05$) were found between the measures and the health behaviors examined. It is recommended that future studies use the Perceived Religious Influence on Health Behavior scale and the revised Illness as Punishment for Sin scale when examining these constructs among Latina women. Additional research is needed to clarify why no significant relationships were found between these measures and the health behaviors examined.

Symposium 36 1:30 PM-2:45 PM

BASIC HEALTH DECISION RESEARCH IN DIVERSE POPULATIONS: ONGOING WORK AND FUTURE DIRECTIONS

Jennifer Hay, PhD[1], Austin S. Baldwin, PhD[2], Kimberly Kaphingst, ScD[3], Amber Emanuel, Ph.D.[4], Betina Yanez, Ph.D.[5]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]Southern Methodist University, Dallas, TX; [3]University of Utah and Huntsman Cancer Institute, Salt Lake City, UT; [4]University of Florida, Gainesville, FL; [5]Northwestern University Feinberg School of Medicine, Chicago, IL

The science of decision making has important implications for behavioral medicine. Problems such as how, when, and among whom health protective behaviors are adopted and maintained, and how risk behaviors can be best eliminated have been informed by a thriving body of work. One example is the finding that people make different health decisions based on whether the consequences of a behavior are framed as gaining something positive or avoiding something negative. However, much of the work regarding the basic science of decision making has been conducted in academic samples of convenience, where decisional experiments can be easily mounted, or using on-line survey panels, where large samples can be collected with modest resources. Such samples tend to be highly educated and are not racially or ethnically diverse enough to be representative of the US population. Measures, findings, and interventions developed in these ways are often adapted and applied across more diverse settings, yet a growing body of evidence indicates that basic decisional principles may differ in profound ways across different population subgroups. Consequently, there is untapped potential to develop novel theory and decision principles based on data from more diverse samples and to thereby increase the likelihood that subsequent interventions are effective in underserved populations. In this Symposium, jointly sponsored by Health Decision Making and Ethnic Minority and Multicultural Health Special Interest Groups, we will provide three examples of basic health decision research in diverse populations. Austin Baldwin will present research regarding self-persuasion principles in a safety-net population with lower education and literacy levels. Amber Emanuel will present findings regarding the use and limits of self-affirmation interventions in a community sample. Kim Kaphingst will present work examining the complex influences of decisional conflict, trust, and race on intentions to donate to a cancer biobank in a diverse population. Finally, Betina Yanez, an expert in racial/ethnic minority populations, will provide discussion regarding the use of basic decision research to enhance health across diverse populations. This Symposium will encourage applied and basic researchers to conduct basic decision research in diverse community and clinic settings, and with US subpopulations that vary across socioeconomic status as well as racial and ethnic subgroups. Such work will enhance basic science and lead to new opportunities for health promotion.

Symposium 36A

DEVELOPING AND TESTING A SELF-PERSUASION INTERVENTION IN A SAFETY-NET CLINIC POPULATION

Prof. Austin S. Baldwin, PhD

Objective: Self-persuasion is an effective behavior change strategy (Stice et al., 2008). However, self-persuasion interventions have typically been used among well-educated populations (Baldwin et al., 2013) and have not been developed for lower income and diverse populations or to promote human papillomavirus (HPV) vaccination. We developed a tablet-based application with voiceover narration (in English and Spanish) to elicit parental self-persuasion for adolescent HPV vaccination. We then evaluated the feasibility of the self-persuasion tasks (generate and verbally articulate one's own arguments for HPV vaccination) and their effect on parents' decision-making in a racially and ethnically diverse safety-net population with lower education and literacy levels.

Methods: Parents (N=45) of age-eligible adolescents used the self-persuasion application. Then, during cognitive interviews, staff gathered quantitative and qualitative feedback on the self-persuasion tasks and on parental decision stage.

Results: The self-persuasion tasks were rated as easy to complete (*M* range 1.00 to 2.32 on a 5-point difficulty scale) and helpful (*M* range 4.33 to 4.98 on a 5-point helpfulness scale). Among the 33 parents who had not previously thought about or were undecided about getting the vaccine for their adolescent, 27 (81.8%; $\chi^2(1) = 13.36$, $p < .001$, $\varphi = .64$) reported deciding to get their adolescent vaccinated after completing the self-persuasion tasks, a significant and large effect. No results differed between Spanish- and English-speakers.

Conclusions: The self-persuasion application was feasible and facilitated parents verbalizing their own reasons for HPV vaccination in a low literacy, diverse safety-net population. Its use also resulted in a change in parents' decision stage. In a current randomized controlled trial (RCT) conducted in this lower income and diverse population, we are testing (1) the efficacy of the tablet-based application on HPV vaccine series initiation and completion, and (2) whether basic cognitive and motivational mechanisms (i.e., deep cognitive processing, autonomous motivation) hypothesized to underlie self-persuasion mediate its effect.

Symposium 36B

IMPACT OF RACE, DECISIONAL CONFLICT, AND TRUST ON BIOBANK INTENTIONS IN AN UNDERSERVED POPULATION

Kimberly Kaphingst, ScD

Introduction. Biobanks are an essential resource for research in the era of precision medicine. Participation of all population subgroups is critical so that findings reflect the needs of diverse communities and address disparities. Research is needed to examine factors that impact decisions to participate in a biobank among underserved populations.

Methods. We conducted a randomized experiment to examine how model of consent for secondary use of biospecimens affected intentions to donate to a cancer-related biobank. We recruited 356 women aged 40 and older stratified by race; 56% were Black and 44% were White. Participants reviewed three informed consent documents in a randomized order based on different models of consent: notice (informs that samples will be used in future research); broad (asks permission once for multiple future studies); and study-specific (asks permission before each future study). After each document, we assessed intention to donate with a four-point scale from “definitely not” to “definitely.” We also assessed trust in medical research and decisional conflict as factors that might affect intention. We used multivariable logistic regression to examine predictors of intention for each consent model.

Results. 47% of participants had an annual household income less than $20,000; 31% had no education beyond high school. The proportion who “definitely” intended to donate was 58% for study-specific; 44% for broad; and 41% for notice. In multivariable analyses, Black women were significantly less likely to intend to donate for each consent model than White women ($p<.05$). Those with higher decisional conflict were significantly less likely to intend to donate for each consent model ($p<.05$). After adding trust, race was no longer a significant predictor of intention for the notice and broad consent models.

Discussion. Intentions to donate to a cancer biobank differed by race; this association was partly mediated by trust. Decisional conflict also lowered intentions to donate. These findings suggest that strategies to assist informed decision making are essential for underserved populations and that trust may be critical to decisions about donating to biobanks.

Symposium 36C

USING SELF-AFFIRMATION IN A COMMUNITY SAMPLE TO INCREASE ORAL CANCER SCREENINGS

Amber Emanuel, Ph.D.

Objective: Self-affirmations, when an individual affirms a valued aspect of his or her self, allow individuals to accept threatening health information. Accepting this threatening health information may then allow individuals to decide to take action related to their health. In a study of low-income men a self-affirmation manipulation was conducted to examine if after being self-affirmed, high-risk men would be more accepting of health information related to their risk of oral cancer.

Methods: Participants (*n* = 152) were Black or White men over the age of 40 who had smoked at least 100 cigarettes in their lifetime. Participants were recruited by word of mouth and interviews were conducted in community settings, such as churches or classrooms at local colleges. Participants answered questions about their health behaviors, completed a standard self-affirmation manipulation, watched a video that explained the risks of oral cancer and detailed the process of an oral cancer examination, and then answered questions related to their attitudes and intentions. Participants could then schedule a free oral cancer screening.

Results: The majority of participants were low-income (49% of participants reported income of less than $20,000) and of lower education (61% of participants had a High School degree or less). Approximately half of participants completed a self-affirmation condition or a control condition. However, the self-affirmation manipulation failed to increase self-affirmative thoughts and feelings. Participants in the self-affirmation condition, following the self-affirmation manipulation, did not rate themselves as being more affirmed (M = 4.56, SD = .97) than those participants in the control condition (M = 4.46, SD = 1.19), t (176) = .62, p = .54. Across both conditions, participants reported low defensive avoidance of information related to oral cancers (M = 1.12 (out of 5), SD = .49). However, men who did report high information avoidance were more likely to make risky health-related decisions. Specifically, defensive avoidance was related to lower intentions to schedule a free oral cancer screening (r = -.18, p = .02).

Conclusions: Since self-affirmation usually dampens the defensive response against threatening health information, the finding that defensive avoidance of information led to lower intentions highlights the need for successful implementations of self-affirmations in this population. In the current study, self-affirmations did not predict lower defensive information avoidance, but the manipulation used for self-affirmations in the current study may not be as ideal for community populations as they are for the college undergraduate populations. Suggestions for how to successfully implement self-affirmations in low-income or low-literacy populations so individuals can make better health related decisions will be discussed.

Symposium 37 1:30 PM-2:45 PM

LUNG CANCER SURVIVORS: A GROWING POPULATION WITH UNIQUE PSYCHOLOGICAL AND BEHAVIORAL NEEDS

Jamie Ostroff, PhD[1], Heidi Hamann, PhD[2], Elyse R. Park, PhD, MPH[3], Jamie L. Studts, PhD[4], Maureen Rigney, MSW[5]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]University of Arizona, Tucson, AZ; [3]Massachusetts General Hospital, Boston, MA; [4]University of Kentucky College of Medicine, Lexington, KY; [5]Lung Cancer Alliance, Washington, DC

Introduction: Lung cancer is the leading cancer killer for both women and men. However, recent advances in low dose CT screening, multimodality management, targeted chemotherapy, and immunotherapy are responsible for an estimated 384,000 survivors of lung cancers. Although only a small proportion of cases are diagnosed at an early stage each year, of the 225,000 people diagnosed annually with lung cancers, more than 32,000 will survive for at least five years. Lung cancer survivors face unique challenges, including stigma (the perception and internalization of negative appraisal and devaluation from others), risk of persistent smoking, and a dearth of specialized survivorship resources.

Methods: Here, we report on data from lung cancer survivors that address these concerns and provide guidance for future research and service. Each presentation addresses unique, yet interconnected themes, related to lung cancer survivorship.

Results: The first presentation describes a patient-focused process of developing a measure of lung cancer stigma. The next presentation focuses on both short- and long-term smoking and cessation data from a national cohort of lung cancer survivors and public responses to these data. Presentations conclude with an introduction to a novel survivorship program aimed at the unique needs of individuals with lung cancer. Our discussant offers future directions for research, clinical practice, and advocacy to address the unmet needs of lung cancer survivors.

Discussion: Lung cancer survivors are a growing proportion of the overall cancer survivorship population with unique psychosocial and behavioral challenges. Increasing our focus on stigma, smoking cessation, and survivorship interventions represents crucial steps in addressing the needs of lung cancer survivors.

Symposium 37A

DEVELOPMENT AND PRELIMINARY PSYCHOMETRIC EVALUATION OF A PATIENT-REPORTED OUTCOME MEASURE FOR LUNG CANCER STIGMA

Dr. Heidi Hamann, PhD

Introduction: The robust causal connection between smoking and lung cancer underscores the relevance of smoking prevention and cessation interventions. However, it may also inadvertently result in stigma (negative appraisal and devaluation) toward lung cancer patients and survivors. Internalization of this stigma can have negative psychosocial consequences, including depressive symptoms, lower quality of life, and reduced satisfaction with provider communication. Increased recognition of lung cancer stigma calls for attention to identifying valid and reliable measurement tools that incorporate significant patient and expert input.

Method: We report on the multiphase process of measure development to assess patient-reported stigma. Our earlier work described the process of patient and survivor interviews and development of a conceptual framework for lung cancer stigma. Here, we describe the process of item generation/refinement, and initial psychometric scale evaluation for the Lung Cancer Stigma Inventory (LCSI).

Results: We started with a pool of 240 items culled from existing stigma scales and new items based on our conceptual framework. Item refinement (to 49 items) was achieved through a multistep process including: a) expert input on item relevance and clarity, and b) cognitive interviews with 20 lung cancer patients and survivors. A multi-site sample of 231 lung cancer patients and survivors completed the 49-item survey. Exploratory factor analysis (EFA) was used to identify a 25-item scale with three primary factors: Internalized Stigma (alpha=.90), Perceived Stigma (alpha=.74), and Constrained Disclosure (alpha=.82). Two-week test-retest correlation was high (r = .90), suggesting strong stability of measurement over time.

Conclusions: Based on current measurement guidelines that emphasize significant patient input and our conceptual model, we have developed a reliable new measure of lung cancer stigma, the Lung Cancer Stigma Inventory (LCSI). Two factors reflected our concept elicitation work identifying relevant themes of negative appraisal and devaluation from others (Perceived Stigma), as well as self-blame, guilt, and regret (Internalized Stigma). A third factor, Constrained Disclosure, reflects information withholding and avoidance that may suggest interpersonal intervention pathways. Subsequent psychometric work is needed to establish further evidence of validity and clinically meaningful change.

Symposium 37B

SMOKING RATES AMONG LUNG CANCER SURVIVORS AND CORRESPONDING PUBLIC RESPONSE

Dr. Elyse R. Park, PhD, MPH

Background: Smoking is the leading risk factor for lung cancer; continued smoking after diagnosis may adversely affect treatment outcomes, subsequent cancers, and QOL. We assessed short and long term smoking rates among a population-based cohort of lung cancer survivors (LCS) and explored public opinion to better understand stigmatization toward them.

Methods: We examined smoking rates, at 5-months and 6 years post-diagnosis (n=2455 and 198, respectively; median age=65; 69% White; 45% Stage I/II), among LCS from the Cancer Care Outcomes Research and Surveillance cohort. Short-term results were published online, and 432 comments were posted on a public discussion board. We used qualitative content analysis to establish a theoretical framework to explain public attitudes about LCS' smoking.

Results: 38% of LCS were current smokers during the year diagnosis; 14% were smokers at 5 months post-diagnosis. 6 post-diagnosis, 16.2% of LCS reported tobacco use, but only 6.4% participated in a smoking cessation program, in the past year. Public responses to LCS' smoking were divided into sympathetic vs. stigmatizing attitudes. Attitudes were shaped by personal experiences with smoking and familiarity with lung cancer. Personal experiences influenced beliefs about cancer (e.g., causes and fatalistic outcomes) and smoking (e.g., ability to quit, benefits of quitting after cancer). Stigmatizing beliefs toward LCS who smoked were expressed by individuals less familiar with smoking and lung cancer; these individuals tended to endorse the inevitability of smoking causing cancer, were pessimistic about the benefits of quitting post diagnosis, and emphasized personal choice over nicotine addiction

Conclusions/Implications: A sizable minority of LCS did not quit smoking and, at long-term follow-up, continued to use tobacco; few sought support. LCS may be vulnerable to public stigma, particularly from individuals unfamiliar with the struggles of quitting and its benefits. This work provides insight into challenges LCS might face in their attempts to quit.

Symposium 37C

DEVELOPMENT OF THE KENTUCKY LEADS COLLABORATIVE LUNG CANCER SURVIVORSHIP CARE PROGRAM

Dr. Jamie L. Studts, PhD

Introduction: Individuals diagnosed with lung cancer commonly suffer numerous threats to preserving quality of life, including substantial symptom burden, clinically significant distress, and considerable stigma/bias secondary to their tobacco-related malignancy. Despite these survivorship challenges, relatively little effort has been allocated to developing interventions that address the unique experience of lung cancer survivors and their caregivers.

Method: To expand lung cancer survivorship care, the investigative team developed a targeted and tailored psychosocial intervention to address the diverse needs of lung cancer survivors and the challenges faced by caregivers. Principles of motivational interviewing and shared decision making guided development of the Kentucky LEADS Collaborative Lung Cancer Survivorship Care program.

Results: Selection of intervention content was based on a review of the literature, input from lung cancer survivorship experts, and feedback from an engaged community advisory board. During the development phase, the investigative team confronted the challenge of designing a psychosocial intervention that is feasible to deliver in diverse cancer care settings and would be acceptable to this underserved and difficult to reach population. To promote implementation feasibility, the investigative team “designed for dissemination,” creating an intervention that was discipline, delivery mode, and setting neutral. To enhance program acceptability, design focused on common unmet needs, but also incorporated a content menu that allows lung cancer survivors to select modules aligned with their personal concerns. After conducting online and in-person interventionist training, program feasibility, acceptability, and preliminary efficacy are being evaluated in a single-arm trial in 10 Kentucky cancer care facilities. Approximately 300 lung cancer survivors and caregivers will complete validated patient-reported outcome measures, including program acceptability assessments.

Conclusion/Implications: Based on results, the investigative team plans to modify the intervention and training program and then conduct a group randomized trial in collaboration with the Kentucky Clinical Trials Network.

Paper Session 8: Neighborhood and Environmental Influences on Physical Activity 3:00 PM-3:15 PM

MODERATORS OF OBJECTIVELY MEASURED NEIGHBORHOOD SAFETY AND PHYSICAL ACTIVITY AMONG ADOLESCENTS

Jessa K. Engelberg, BA[1], James Sallis, PhD[1], Terry L. Conway, PhD[1], Kelli Cain, MA[2], Carie Geremia, N/A[3], Larry Frank, PhD[4], Karen Glanz, PhD, MPH[5], Brian E. Saelens, PhD[6]

[1]University of California, San Diego, San Diego, CA; [2]University California San Diego, San Diego, CA; [3]UCSD, San Diego, CA; [4]University of British Columbia, Vancouver, BC, Canada; [5]University of Pennsylvania, Philadelphia, PA; [6]University of Washington, Seattle, WA

Objective: The relation between neighborhood safety and physical activity (PA) and the factors that moderate this relation are unclear. The current study examined this among adolescents. **Methods:** Participants were aged 12-17 years (n=725) from the Baltimore, MD and Seattle, WA regions, with 50% male and 33% non-white. Moderate-to-vigorous PA (MVPA) in the neighborhood was determined through accelerometers and GPS. Objective neighborhood safety data were collected using a validated observational measure of streetscapes (MAPS). Survey-reported (from parent and adolescents) moderators at multiple ecological levels were examined: individual (e.g. gender, BMI), psychosocial (e.g. self-efficacy, social support), home environment (e.g. electronics ownership, home PA equipment) and perceived neighborhood safety (e.g., traffic safety, safety from crime). A final multilevel generalized linear regression model identified main and cross-level moderator effects. **Results:** There were 7 main effects (pConclusions: Main effects or moderators were identified from all tested levels of the ecological model, supporting the ecological approach and implying that multi-level interventions are promising. Findings suggest that living in an objectively safer neighborhood may benefit White non-Hispanics and help those with low social support or moderate perceived environmental barriers overcome these limitations and engage in PA in the neighborhood.

Paper Session 8: Neighborhood and Environmental Influences on Physical Activity 3:16 PM-3:30 PM

FIVE-YEAR POST-INTERVENTION FOLLOW-UP OF PHYSICAL ACTIVITY AND ASSOCIATIONS WITH THE BUILT ENVIRONMENT

Heather J. Leach, PhD[1], Daniel P. O'Connor, PhD[2], Richard J. Simpson, PhD[3], Hanadi Rifai, PhD[3], Scherezade K. Mama, DrPH[4], Rebecca E. Lee, PhD[5]

[1]Colorado State University, Fort Collins, CO; [2]University of Houtson, Houston, TX; [3]University of Houston, Houston, TX; [4]The Pennsylvania State University, State College, PA; [5]Arizona State University, Phoenix, AZ

Background: Few studies have examined long-term maintenance of physical activity (PA) after completion of a PA intervention. Ecologic models of PA posit that extra-individual factors, such as the built environment, have a direct influence on PA, potentially extending the success of behavioral interventions. This study examined PA five-years after completion of a community-based, randomized controlled trial (RCT) and the association of built environment characteristics with PA changes. *Method:* African American women who completed the RCT were eligible to participate. The International PA Questionnaire (IPAQ) measured PA at baseline, post-intervention and five-year follow up. Built environment characteristics included the presence and quality of PA resources, neighborhood walkability, and traffic and crime safety. Paired t-tests examined changes in PA. Stepwise linear regression models examined associations between built environment variables and PA change scores (five-year follow-up minus post-intervention PA). *Results:* Of the 140 women who completed the RCT, 21.4% (N=30) participated in the follow-up study. The majority (39%, N=55) were lost due to outdated contact information. From post-intervention to five-year follow-up, walking (p=.008, Δ=-461.9 MET-min/week) and leisure-time (p=.015, Δ=-154.4 MET-min/week) PA decreased. There were no significant changes in moderate, vigorous or total PA, but trends showed that moderate PA increased, vigorous PA decreased and total PA remained the same. When built environment variables were added to regression models, they explained a greater proportion of the variance in PA change, (R^2 increase range = 002-.478, all p>.05). *Conclusions:* Long-term maintenance of PA following an intervention may depend on the domain or type of activity. Future studies should include objective measures of PA and plan a priori for long-term follow-up by ensuring up-to-date participant contact information is maintained. Further research on PA maintenance is needed, and should utilize more advanced statistical techniques to explore individual and psychosocial factors as mediators or moderators of built environment influence on long-term PA.

Paper Session 8: Neighborhood and Environmental Influences on Physical Activity 3:46 PM-4:00 PM

TAILORED INTERVENTION CHANGES WALKING BEHAVIOR AND PERCEIVED LOCAL NEIGHBORHOOD SIZE

Katie M. Heinrich, PhD[1], Joseph Lightner, MPH[2], Kara Saiki, MPH[3], Cheryl Albright, PhD, MPH[4]

[1]Kansas State University, Manhattan, KS; [2]University of Kansas Medical Center, Kansas City, MO; [3]University of Hawai`i at Manoa, School of Nursing and Dental Hygiene, Honolulu, HI; [4]Univeristy of Hawaii at Manoa, Honolulu, HI

Various neighborhood sizes have been studied for health outcomes. Perceived local (close to home) neighborhoods are affected by physical, social, and personal characteristics including daily activities like walking. It is unknown how a perceived neighborhood area might change over time. This study examined changes in perceived neighborhood size before and after a moderate-to-vigorous physical activity (MVPA) intervention for new mothers.

In the Na Mikimiki study, conducted 2008-2012 in Honolulu, HI, healthy but underactive new mothers (N = 278; mean age = 32 ± 6 years, 84% ethnic minority) with infants 2-12 months at entry were randomized to either a “standard, information only” (comparison) condition that included MVPA print/website materials or a tailored (intervention) telephone counseling and eHealth technology condition, to promote MVPA, largely walking. Baseline and 12-month measures included sociodemographics and the Active Australia survey (with specific walking questions). Participants drew an enclosed boundary around their home address to indicate their neighborhood at each time point. If they reported walking in their neighborhood, they also drew in their walking route. ArcGIS 10.4 and SAS 9.3 were used for analysis.

Complete data were available from 124 women (comparison = 68, intervention = 56). Minutes walked/week significantly increased from baseline to 12-months in the comparison group (57 ± 71-min to 88 ± 134-min; t = 6.28, $p < 0.001$), and the intervention group (54 ± 66-min to 141 ± 150-min; t = 3.43, p = 0.001). Average neighborhood size decreased significantly from 1,057-km^2 to 1,025-km^2 in the comparison group (t = 6.49, $p < 0.001$) and increased significantly from 557-km^2 to 573-km^2 in the intervention group (t = 6.05, $p < 0.001$). Neighborhood walking route distance did not change in the comparison group (p = 0.80) but significantly increased from 2.5-km^2 to 4.3-km^2 in the intervention group (t = 5.09, $p < 0.001$). Intervention main effects were significant for change in neighborhood size (t = 1.93, p = 0.05).

Walking increased for all participants, but 107% more for the tailored intervention group. Accordingly, average neighborhood size and the neighborhood walking route distance significantly increased in the intervention group. Researchers should consider that perceived neighborhood size increases for women when they walk more in their neighborhoods.

Paper Session 8: Neighborhood and Environmental Influences on Physical Activity 4:01 PM-4:15 PM

MEDIATORS OF A TWO-YEAR PHYSICAL ACTIVITY INTERVENTION FOR CHURCHGOING LATINAS PARTICIPATING IN FE EN ACCIóN/FAITH IN ACTION

Elva M. Arredondo, PhD[1], Jessica Haughton, MPH, MA[2], Guadalupe X. Ayala, Ph.D. MPH[1], Donald J. Slymen, PhD[1], James Sallis, PhD[3], Lilian Perez, MPH[4], Natalicio Serrano, MPH[5], John Elder, PhD, MPH[1]

[1]San Diego State University, San Diego, CA; [2]San Diego State University/UC San Diego Moores Cancer Center Partnership Institute for Behavioral and Community Health, San Diego, CA; [3]University of California, San Diego, San Diego, CA; [4]UC San Diego/San Diego State University, San Diego, CA; [5]Washington University at St. Louis, San Diego, CA

Objectives: Hispanic/Latina women are less likely to engage in leisure time physical activity than women from other ethnic/racial backgrounds. Faith-based organizations are a promising setting for promoting preventive health behaviors among Latinas. This cluster randomized controlled trial evaluates an intervention involving community health workers (CHWs) targeting different levels of the ecological model to promote physical activity.

Design: Sixteen churches were randomly assigned to a physical activity intervention or cancer screening comparison condition and about 27 women per church were recruited to serve on an evaluation cohort.

Measurements: We enrolled 436 Latinas (aged 18-65 years) who engaged in less than 250 min/wk of moderate to vigorous physical activity (MVPA) at baseline as assessed by accelerometer. At baseline, 12- and 24-months follow-up, we collected accelerometer assessed MVPA, socio-demographic data, self-reported leisure time MVPA, and potential mediator variables like strategies for engaging in physical activity and social support for physical activity.

Results: After adjusting for socio-demographic factors, findings of the mixed effects analyses suggested significant increases in self-reported leisure time MVPA (p

Summary: Encouraging participants to buy exercise equipment, seek social support, and set goals for physical activity may be key areas to target in future physical activity programs. Current study findings suggest that a faith-based intervention led by CHWs can be a culturally sensitive approach to promoting physical activity and other health behaviors among Latinas.

CITATION AWARD WINNER

ENVIRONMENTAL AND INDIVIDUAL INFLUENCES ON CHANGE IN ACTIVITY AMONG NON-ATHLETIC MIDDLE-SCHOOL STUDENTS; GENDER DIFFERENCES

Margaret Schneider, Ph.D.

University of California, Irvine, Irvine, CA

Background: Adolescence is characterized by a general trend toward declining physical activity. By the time adolescents enter high school, approximately 57% of females and 38% of males do not meet current recommended levels of moderate-to-vigorous physical activity (MVPA). Factors at multiple levels (i.e., physical environment, motivations to exercise, and physiological characteristics) are related to MVPA, but little is known about the relative influence of these different factors on change in MVPA over time among middle-school students.

Methods: Middle-school students (N = 127, 49% male, 48% Latino) who reported not engaging in organized sport at the time of recruitment completed assessments of motivations to exercise (MPAM-R), body mass index and cardiorespiratory fitness (VO2peak; graded cycle ergometer) in the fall of their 6th-grade year. Parent/guardians reported their perceptions of neighborhood safety in the fall. MVPA (ActiGraph) was assessed in the fall and again in the spring. Hierarchical regression analysis examined the independent associations of each influencing factor on change in MVPA over time for males and females separately.

Results: At baseline, mean daily minutes of MPVA were 51.83 (SD = 20.76) for boys and 38.66 (SD = 14.80) for girls. The mean change in MVPA from fall to spring was 2.69 (SD=18.67) for boys and -.38 (SD = 10.94) for girls. Controlling for baseline MVPA, neighborhood safety predicted spring MVPA among boys only (B = -4.19, p< .05). Greater perceptions of neighborhood threats (e.g., gangs, traffic, danger) were associated with decreased MVPA from fall to spring. Among females, none of the influencing factors significantly predicted change in MVPA.

Conclusions: At baseline, boys were engaging in greater MVPA than girls, and this difference persisted into the spring. However, the change in activity from fall to spring was more variable among boys than among girls. Moreover, neighborhood safety predicted change in activity among boys and none of the individual-level factors predicted change in activity

among either boys or girls. Among middle-school boys who do not participate in organized sports, neighborhood safety has a stronger influence on activity levels over the school year than intrinsic motivation to exercise, body composition, or cardiorespiratory fitness.

Paper Session 9: Understanding Obesity: Cells to Society 3:00 PM-3:18 PM

CITATION AND MERITORIOUS AWARD WINNER

ROLE OF METABOLIC HORMONES IN THE OBESITY-DEPRESSION-INFLAMMATION LINK

Yesenia Cabrera, B.S.[1], Tiefu Cheng, M.S.[2], Nicholas Guay-Ross, B.S.[2], Suzi Hong, Ph.D.[2]

[1]University of California Los Angeles, Los Angeles, CA; [2]University of California San Diego, La Jolla, CA

Obesity is marked by a state of chronic inflammation as well as metabolic dysregulation. Knowledge in the underlying mechanisms of obesity-related chronic inflammation is incomplete, perpetuating limited options for efficacious therapeutics, including behavioral interventions. With up to 50% of overweight or obese individuals reporting clinically relevant depressive symptoms, challenges in implementing health behavior interventions are only compounded. Depression and obesity both present with elevated inflammation. Adipose tissue acts as an endocrine organ by secreting inflammatory cytokines and adipokines such as leptin. We previously reported that dysregulation of inflammatory processes mediated by glucocorticoid receptors (GRs) underlies both obesity and elevated depressive symptoms. In the current study we investigated the role of leptin and insulin resistance in the obesity-depression-inflammation link among 129 asymptomatic men (49.6%) and women (50.4%) of 18 – 65 years of age. Depressive symptoms were measured using Beck Depression Inventory (BDI). Fasting leptin and insulin levels in plasma were measured using a multiplexed immunoassay. Homeostatic model assessment was calculated to indicate insulin resistance ("HOMA-IR"). Thirty-one, 40% and 30% of the participants were lean, overweight and obese, respectively. The average total BDI score was 5.7 (± 6.2) with a range of 0 - 31. Levels of leptin and insulin were 19.06 (± 24.04) ng/mL and 342.7 (± 346.4) pg/mL. Mean HOMA-IR was 1.78 (± 1.96), indicating normal insulin resistance on average, while 8% and 6% of the sample showing HOMA-IR > 3 and > 5 exhibited moderate and severe IR, respectively. BDI total and somatic scores were correlated with BMI (r= .30 for total; .35 for somatic), leptin levels (r= .28, .34), HOMA-IR (r= .27, .32), and GR-mediated cellular inflammation regulation (r= .45, .56) (p's .05 to .001). In multivariate models HOMA-IR (β= .24, p< .05) remained a significant predictor for BDI somatic scores even after adjusting for covariates (age, gender, ethnicity, mean blood pressure) and BMI. However, leptin no longer predicted depression once BMI was entered into the model. We found that even subclinical insulin resistance is associated with depressive mood and underlying inflammation, with or without obesity in consideration. The insulin pathway may be a promising target in scrutinizing the depression-inflammation link in metabolic and endocrine disorders.

FEASIBILITY, ACCEPTABILITY, AND INITIAL OUTCOMES OF A NETWORKED BEHAVIORAL WEIGHT LOSS PROGRAM

Christine C. Call, A.B., Leah M. Schumacher, M.S., Jocelyn E. Remmert, B.A., Evan M. Forman, PhD, Meghan L. Butryn, PhD

Drexel University, Philadelphia, PA

There is a critical need to enhance the efficacy of behavioral weight loss (BWL) for obesity. Enrolling individuals in BWL with members of their social networks (e.g., friends, family members) may improve adherence to weight control efforts by increasing positive social influence and decreasing negative social influence related to eating and physical activity. BWL delivered to social networks (“networked BWL”) has not been evaluated using a randomized controlled design, and it is unclear if individuals will be willing to enroll in a networked BWL research trial knowing that there is a 50% chance that they will be treated without their social network. The current study examined the feasibility and acceptability of a randomized networked BWL trial and explored initial outcomes. Overweight or obese adults interested in a 4-session BWL program were required to recruit two or more overweight or obese network members who also wanted to lose weight. Index participants (i.e., the individual first contacting the study) were randomized to receive treatment with or without their recruited network members. Seventeen index participants and 41 network members enrolled. Nine index participants were assigned to BWL with their 24 network members. Eight index participants were assigned to BWL without their network; their 17 network members received a delayed intervention. Recruitment rates were consistent with other weight loss studies, demonstrating that index members were willing to recruit network members despite the possibility of being treated separately. Attendance and retention across groups was high (>90%), supporting the feasibility of a randomized networked design. Qualitative interviews and focus groups revealed high treatment acceptability. Ninety-three percent of participants in networked BWL reported being “satisfied” or “very satisfied” with treatment and 92.6% reported that networked treatment “very much” or “somewhat” helped them lose weight. Weight losses from session 1 to 4 were as follows: index participants in networked BWL=3.5%, index participants in standard BWL=2.9%, network members in networked BWL=2.4%. Future research is warranted to determine if weight losses differ across conditions with a larger sample and greater dose of treatment.

ASSOCIATIONS BETWEEN HEALTHFUL FOOD PURCHASING AND BMI CHANGE VARY BY AGE

Brad Appelhans, PhD[1], Christy Tangney, PhD[1], Simone French, PhD[2], Lisa Powell, PhD[3], Yamin Wang, MS[1], Elizabeth Avery-Mamer, MS[4]

[1]Rush University Medical Center, Chicago, IL; [2]Div. Epidemiology & Community Health, Minneapolis, MN; [3]University of Illinois at Chicago, Chicago, IL; [4]Rush University Medical Center, Morton Grove, IL

Household food purchases represent a potentially important source of information about individuals' food preferences and diet quality, and less healthful food purchasing patterns may be predictive of weight gain. Associations between the overall diet quality of household food purchases and 12-month change in body mass were examined in a diverse sample of 112 primary household food shoppers [81% female; mean age=43.9 (SD=12.9); 36% African-American, 35% non-Hispanic white, 16% Hispanic, 13% "other/multiracial"). Participants collected and annotated receipts for all household food and beverage purchases (16,087 total) over 14 days. Research staff photographed purchased foods during four visits to participants' homes. The Healthy Eating Index-2010 (HEI-2010) scoring system was applied to summarize the overall diet quality of food purchases. Body mass index (BMI) was calculated from height and weight measured during the 14-day food purchase assessment period, and after 12 months of follow-up (98% retention). Over 12 months, average change in BMI was 0.36 (SD=1.81) kg/m^2, with 27% of participants exhibiting clinically meaningful 12-month BMI change of ≥1.0 kg/m^2 or more. Age was inversely related to observed weight change (r=-.18, p < .05) such that younger participants demonstrated greater BMI increases. HEI-2010 scores for food purchases varied widely (M= 60.3, SD=16.2 on a 0-100 scale), but did not differ by age (r=.04, p=.65). The odds of a BMI gain ≥1.0 kg/m^2 was predicted by an interaction between HEI-2010 scores and age (p=.03) in logistic regression models adjusting for baseline BMI, demographic variables, and the presence of children in the household. Every 10-point increase in HEI-2010 score was associated with reduced odds of demonstrating BMI gain ≥1.0 kg/m^2 among subjects ages 21-34 y (n=37; OR=0.18, 95%CI: 0.04, 0.85), but not in subjects ages 35-49 y (n=36; p=.80) or age ≥50 y (n=39; p=.99). The interaction between age and food purchasing was also observed when BMI change was modeled as a continuous outcome (p=.003). Food purchasing patterns may be an important intervention target for obesity prevention in younger adults. Funded by R01HL117804. ClinicalTrials.gov: NCT02073643.

BEHAVIORAL WEIGHT LOSS VS STEPPED MULTI-MODAL TREATMENT FOR BINGE EATING DISORDER: ACUTE AND LONGER-TERM 18-MONTH OUTCOMES

Carlos M. Grilo, PhD

Yale University School of Medicine, New Haven, CT

Objective: Randomized controlled trial tested the effectiveness of a stepped-care multi-modal approach versus behavioral weight loss (BWL) for patients with obesity and binge eating disorder (BED).

Methods: 191 patients (mean age 48, 71% female, 79% white) with BED and co-morbid obesity (mean BMI 39) were randomly assigned to 6 months of BWL (N=39) or stepped-care (N=152). Within stepped-care, patients started with BWL for one month; treatment-responders continued BWL while non-responders switched to specialist treatment (CBT) and all stepped-care patients were additionally randomized (double-blind) to anti-obesity medication or placebo for the remaining five months. Independent assessments were performed at baseline, during treatment, post-treatment (6 months), and 6- and 12-month follow-ups after completing treatments (through 18 months) with reliably-administered structured interviews and measures.

Results: ITT analyses of abstinence rates (zero binges/month) revealed BWL and stepped-care did not differ significantly overall at post-treatment (74% vs 64%) or 12-month follow-up (45% vs 41%). Mixed-models regression analyses of binge-eating frequency through post-treatment revealed significant time effects but BWL and stepped-care did not differ overall; within stepped-care, however, medication was significantly superior to placebo overall and among initial non-responders switched to CBT. Mixed-models of binge-eating frequency during the 12-months after treatment revealed good maintenance that did not differ across treatments. Mixed models revealed significant % weight loss through post-treatment but BWL and stepped-care did not differ overall; within stepped-care, however, medication was significantly superior to placebo overall and among initial responders continued on BWL and non-responders switched to CBT. Mixed-models during follow-up revealed significant time effects with % weight change larger at 6 than 12 months; % weight loss at 12-month follow-up was 4% (BWL), 6% (BWL+placebo), and 7.5% (BWL+medication).

Conclusions: BWL and stepped-care treatments produced significant improvements in binge-eating and weight loss that were maintained through 18 months in obese patients with BED. Anti-obesity medication enhanced outcomes with behavioral treatments within stepped-care.

SODIUM, POTASSIUM, AND MARKERS OF OBESITY AMONG DIVERSE US HISPANIC/LATINOS: RESULTS FROM HCHS/SOL.

Tali Elfassy, MS[1], Yasmin Mossavar-Rahmani, PhD[2], Linda Van Horn, PhD, RD[3], Marc Gellman, PhD[1], Daniela Sotres-Alvarez, DrPH[4], Neil Schneiderman, PhD[1], Martha Daviglus, MD, PhD[5], Jeannette Beasley, PhD[6], Maria LLabre, PhD[7], Pamela Shaw, PhD[8], Guillermo Prado, PhD, MS[1], Hermes Florez, MD PhD[7], Adina Zeki Al Hazzouri, PhD[7]

[1]University of Miami, Miami, FL; [2]Albert Einstein College of Medicine, Bronx, NY; [3]Northwestern University, Chicago, IL; [4]University of North Carolina at Chapel Hill, Chapel Hill, NC; [5]University of Illinois at Chicago, Chicago, IL; [6]New York University, New York, NY; [7]University of Miami, MIami, FL; [8]University of Pennsylvania, Philadelphia, PA

Introduction: Emerging evidence suggests sodium and potassium are associated with obesity independent of energy intake. This relationship has been underexplored, especially among immigrant minority populations with evolving dietary practices exhibited with longer duration of US residence.

Objectives: We evaluated the independent associations of sodium and potassium with measures of obesity among US Hispanics/Latinos and tested whether nativity/duration of US residence moderated these associations.

Methods: The Hispanic Community Health Study/Study of Latinos is a population-based study of 16,415 diverse Hispanics/Latinos aged 18-74 years from four US communities. Dietary sodium, potassium, and energy intake were assessed from two interviewer- administered 24-hour diet recalls in the full sample. Twenty-four hour urine served as the biomarker for sodium and potassium intake and doubly labeled water for energy intake in the ancillary sub-study: Study of Latinos Nutrition & Physical Activity Assessment Study (SOLNAS), n=447. Obesity markers included: measured body mass index (BMI), waist circumference, and body fat measured using doubly labled water. Nativity/duration of US residence was classified as: US born, foreign born with ≥10 years in the US, or foreign born with < 10 years in the US. Linear regression models adjusted for covariates which included energy intake were used to determine the associations among sodium, potassium, with markers of obesity.

Results: In the full sample, mean age was 41 years (SE: 0.02); with 53% female (SE: 0.05). From fully-adjusted linear regression models, a 500 mg/day higher dietary sodium intake was

associated with a higher BMI (0.07 kg/m^2; 95% CI: 0.00, 0.15). Nativity/duration of US residence moderated the association between dietary potassium and BMI ($P < 0.05$), so that higher dietary potassium intake by 500 mg/day was associated with lower BMI among US born participants (-0.62kg/m^2; 95% CI: -0.92, -0.31), lower BMI among those foreign-born living in the US for ≥ 10 years (-0.13 kg/m^2; 95% CI: -0.25, -0.00), and with no significant association among those foreign-born living in the US for < 10 years. Similar associations were observed for waist circumference. Using biomarkers among SOLNAS participants, a 500 mg/day higher urinary sodium was associated with higher BMI (0.27 kg/m^2; 95%CI: 0.09, 0.43) and more body fat (0.53 kg; 95% CI: 0.16, 0.91). Urinary potassium was not associated with BMI or body fat.

Conclusions: Among diverse Hispanics/Latinos, sodium intake was positively associated with BMI, waist circumference, and body fat, independent of energy intake, suggesting a direct assocation between sodium intake and markers of obesity. The inverse relationships between dietary potassium and obesity markers were stronger with longer duration of US residence.

PROMOTING PHYSICAL ACTIVITY IN DYADS OF AFRICAN AMERICAN AND HISPANIC WOMEN THROUGH SOCIAL NETWORKING AND MOBILE TECHNOLOGY

Larkin L. Strong, PhD, MPH[1], Karen Basen-Engquist, PhD, MPH[2], Carrie R. Daniel, PhD, MPH[3], Lorna McNeill, PhD, MPH[1], Diana S. Hoover, PhD[1], Elizabeth Dominguez, MPH[3], Israel Christie, PhD[2]

[1]University of Texas MD Anderson Cancer Center, Houston, TX; [2]The University of Texas MD Anderson Cancer Center, Houston, TX; [3]UT MD Anderson Cancer Center, Houston, TX

Racial/ethnic minority adults have lower rates of physical activity (PA) than non-Hispanic Whites, and women are less active than men. Given the strong influence of family and friends, intervening upon women's existing social networks may represent an important strategy for PA promotion. Here we describe preliminary findings from a pilot randomized trial to test the effect of an intervention designed to build social support and behavioral skills to increase PA in dyads of women. Dyads were randomly assigned to the 16-week intervention, which consisted of dyad-based telephone counseling, an activity monitor with social networking, and health education e-newsletters. Dyads assigned to the control condition received e-newsletters during the study and the activity monitor upon study completion. Participants were assessed in-person at baseline and 16 weeks, and completed an online assessment at 8 weeks. Both objective and self-report measures of PA were collected. Participants included 62 African American (58%) and Hispanic (37%) women (n=31 dyads) aged 25-60 years (mean=44 years). At baseline, 79% of women were obese, 76% were not meeting PA recommendations, 53% reported less than a college education, and 38% reported an annual household income less than $50,000. From baseline to the 16-week follow up, intervention and control participants reported an increase in average weekly minutes of moderate-to-vigorous PA (MVPA) of 116 and 64 minutes, respectively. Preliminary analyses involved mixed effects models to account for clustering within dyads and within participants over time and controlled for age, race/ethnicity, education, and baseline body mass index. Analyses showed that all participants increased their minutes of self-reported MVPA over the 16 weeks (β=21.3, se=6.0, $p < 0.001$), and that MVPA was higher on average among intervention participants than controls (β=104.2, se=48.4, p=0.04). The group by time interaction, however, did not reach statistical significance (β=11.6, se=12.2, p=0.34). Analyses assessing intervention effects on objective PA are ongoing. Findings provide preliminary support for an intervention that builds upon women's existing social networks and uses mobile technology to enhance social support and behavior change skills for increased PA.

Paper Session 10: mHealth Strategies in Women 3:19 PM-3:36 PM

COST EFFECTIVENESS OF A WEB-BASED PHYSICAL ACTIVITY INTERVENTION FOR SPANISH SPEAKING LATINAS: PASOS HACIA LA SALUD

Britta Larsen, PhD[1], Bess H. Marcus, Ph.D.[2], Dori Pekmezi, PhD[3], Sheri J. Hartman, PhD[4], Todd Gilmer, PhD[5]

[1]University of California, San Diego, San Diego, CA; [2]University of California, San Diego, La Jolla, CA; [3]University of Alabama at Birmingham, Birmingham, AL; [4]Department of Family Medicine and Public Health, UC San Diego, La Jolla, CA, USA, La Jolla, CA; [5]UCSD, La Jolla, CA

Background: Latinas report greater rates of lifestyle-related conditions such as obesity and diabetes, and concordantly report particularly low levels of physical activity (PA). There is a need for interventions that can increase PA in this growing population in a broad-scale, cost-effective manner. Given the scalability of web-based programs and the marked increase in Internet use in Latinos, web-delivered interventions have great potential as a cost-effective way to improve health in Latinas. The objective of this study was to examine the costs and cost-effectiveness of a web-based Spanish language PA intervention for Latinas compared to a contact control. **Methods**: Healthy adult Latinas (N=205) were recruited from the community and randomly assigned to receive a Spanish language web-based individually-tailored PA intervention (Intervention), or were given access to a website with content on wellness topics other than PA (Control). PA was measured by 7-Day Physical Activity Recall Interview and ActiGraph accelerometer at baseline, 6 months (post-intervention) and 12 months (maintenance phase). Costs were estimated from a payer perspective and included all features necessary to implement the intervention in a community setting, including staff time (wage, benefits and overhead), materials, hardware, website hosting, and routine website maintenance. **Results**: At 6 months, the cost of the Intervention and Control groups were \$17/month and \$8/month, respectively. These fell to \$12 and \$6 at 12 months. Linear interpolation showed Intervention participants increased their PA by 1362 total minutes at six months (523 by accelerometer) compared to 715 minutes in Controls (186 by accelerometer). At six months, each minute increase in PA for the Intervention cost \$0.08 (\$0.20 by accelerometer), compared to \$0.07 in Controls (\$0.26 by accelerometer). Incremental costs per minute increase associated with the intervention were \$0.08 at six months and \$0.04 at 12 months (\$0.16 and \$0.08 by accelerometer, respectively). Sensitivity analyses showed variations in staffing costs or intervention effectiveness yielded only modest changes in incremental costs. **Conclusions:** While the web-based PA intervention was more expensive than the wellness control, both were quite low cost compared to face-to-face or mail-delivered interventions. Cost-effectiveness ranged markedly based on physical activity measure, and was similar between the two conditions. Overall, the web-based intervention

was effective and low cost, suggesting a promising channel for increasing PA on a large scale in this at-risk population.

Paper Session 10: mHealth Strategies in Women 3:37 PM-3:54 PM

ASSOCIATION BETWEEN PHYSICAL ACTIVITY (PA) INTERVENTION WEBSITE USE AND PA LEVELS AMONG SPANISH-SPEAKING LATINAS

Sarah Linke, PhD, MPH[1], Shira Dunsiger, PhD[2], Kim M. Gans, PhD, MPH[3], Sheri J. Hartman, PhD[4], Dori Pekmezi, PhD[5], Tanya Benitez, PhD[6], Bess H. Marcus, Ph.D.[6]

[1]UC San Diego, La Jolla, CA; [2]The Miriam Hospital and Brown University, Portsmouth, RI; [3]University of Connecticut, storrs, CT; [4]Department of Family Medicine and Public Health, UC San Diego, La Jolla, CA, USA, La Jolla, CA; [5]University of Alabama at Birmingham, Birmingham, AL; [6]University of California, San Diego, La Jolla, CA

The Internet’s low cost and potential for high reach makes web-based channels prime for delivering evidence-based physical activity (PA) interventions. Despite the well-studied success of Internet-based PA interventions in primarily non-Hispanic white populations, evidence about Spanish-speaking Latinas’ use of such interventions is lacking. The recent rise in technology use among Latinas in the US, a population at heightened risk for low PA levels and related conditions, suggests that they may benefit from web-based PA interventions tailored to their cultural and language preferences. Pasos Hacia la Salud tested a Spanish-language, culturally adapted, individually tailored, Internet-based PA intervention vs. a Spanish-lanugage Internet-based Wellness Contact Control condition for under-active Latinas (N=205, M_{age}=39.2 ±10.5, 84% Mexican-American). These analyses examined engagement with the website and explored how use was associated with adoption and maintenance of PA behavior change. Overall, participants logged on to the website an average of 22 times (SD=28) over 12 months, with Intervention participants logging on significantly more than Controls (29 vs. 14.7, $p < .001$). On average, participants spent more time on the website at months 1, 4, and 6 compared to all other months, with max use at month 4. Both logins and time spent on the website were significantly related to intervention success (achieving higher mean minutes of MVPA/week at follow-up: b=.48, SE=.20, p=.02 for objectively measured MVPA and b=.74, SE=.34, p=.03 for self-reported MVPA at 12 months, controlling for baseline). Furthermore, those meeting ACSM guidelines for PA at 12 months (>=150 min/week of MVPA) logged on significantly more than those not meeting guidelines (35 vs 20 over 12 months, p=.002). Among participants in the intervention arm, goal setting features, personal PA reports, and PA tips were the most utilized portions of the website. Higher use of these features was associated with greater success in the program (more minutes of self-reported MVPA at 12 months controlling for baseline, p’s < .05). Specifically, one additional use of these features/month over 12 months translated into an additional 34 min/week of

MVPA (goals feature), 12 min/week (PA tips), and 42 min/week (PA reports). These results demonstrate that greater use of a tailored, web-based PA intervention, particularly certain features on the site, was significantly related to increased PA levels in Latinas.

Paper Session 10: mHealth Strategies in Women 3:55 PM-4:12 PM

CAMINEMOS JUNTAS: A LOCATION-BASED SMARTPHONE APP FOR LATINAS TO CONNECT WITH NEARBY WALKING PARTNERS

Valerie H. Myers, PhD[1], Lyndsay Fluharty, MA[2], Courtney Fultineer, MPH[3], Sophia M. Strickfaden, BA[1]

[1]Klein Buendel, Inc., Golden, CO; [2]Telligen, Greenwood Village, CO; [3]Colorado Foundation for Public Health and the Environment, Denver, CO

Health disparities for Latinas are high. They are more likely than their non-Hispanic White counterparts to be overweight, have diabetes, and be physically inactive. Community-focused walking interventions produce improvements in physical activity (PA) and are well-received by Latinas when they are socioculturally sensitive. New technology has the ability to provide Latinas with innovative ways to connect socially and increase PA. Location-based services (LBS) are a popular technology that uses geographical positioning to allow individuals to use their smartphones to connect to their surrounding environment. *Caminemos Juntas* is an NIH-study developing a prototype smartphone app for use with 18-45 year old Latinas that uses LBS to connect women within geographically proximal neighborhoods as a way to provide social support for increased walking behaviors. The initial phase of the study used multi-method formative research to guide app design and content prior to conducting field usability testing. To guide prototype development, a national sample of Latinas (n=98; mean age 32.7 +/- 7.8 years; 45% primary Spanish speaking; 28.6% with annual income < $15,000) were surveyed to better understand their preferences, usage, needs, and obstacles of current apps in relation to health and PA. Latinas' current PA behaviors and smartphone use, opinions on health-related apps using LBS, and how often they access social networking sites on their phone and their likelihood of using a social networking app to connect to others with intentions to be physically active were also examined. Results revealed that 22.5% never/rarely exercised, 73.5% accessed social networking sites daily with an average of 8 times a day, and 43.9% used LBS every day. Ease of use (82%), informationally accurate (79.2%), and reliability (84.7%) were app features rated as highly important. Over 63% reported high likelihood of using a social networking app to connect to others with the intentions of being physically active, and 67.4% reported that this type of app would be very helpful. Focus groups showed that the app was appealing. A month-long field usability study (n=60) to accurately identify user location and return information to the user to facilitate real-time decision making for partnered walking is currently underway. Survey and formative research results as well as the quantitative outcomes from the completed pilot study will be presented.

ENGAGING BREAST CANCER SURVIVORS IN DEVELOPING A TECHNOLOGY-SUPPORTED PHYSICAL ACTIVITY INTERVENTION: THE FIT2THRIVE STUDY

Siobhan Phillips, PhD, MPH[1], Gillian Lloyd, BA[1], Margaret R. Moran, MPH[1], Danielle Blanch-Hartigan, PhD, MPH[2], David Cella, PhD[1], Kerry S. Courneya, PhD[3], Linda M. Collins, PhD[4], Frank Penedo, PhD[5], Bonnie Spring, PhD[5], Susan LeBailly, PhD, PhD[6], Ronald T. Ackermann, MD, MPH[5]

[1]Northwestern University Feinberg School of Medicine, Chicago, IL; [2]Bentley University, Waltham, MA; [3]University of Alberta, Edmonton, AB, Canada; [4]Penn State, University Park, PA; [5]Northwestern University, Chicago, IL; [6]Northwestern U, Chicago, IL

Most physical activity (PA) interventions for breast cancer survivors (BCS) are intense, on-site and simultaneously test multiple intervention components (i.e. exercise class, coach) designed by research teams with very limited BCS input. Thus, these interventions have limited patient-centeredness and scalability. To address this, the present study used a mixed-methods, patient-centered approach to develop five remotely-delivered, technology-supported PA intervention components. Following this formative phase, we will examine these components in conjunction with a “core” intervention for feasibility, acceptability and preliminary effects on PA using the Multiphase Optimization Strategy (MOST) in the Fit2Thrive trial. MOST uses a highly efficient experimental design to evaluate individual and combined effects of intervention components to determine which ones are, or are not, effective. A nationwide sample of BCS [n=96; M_{age}=56 (SD=10.4] completed an online needs assessment. A subsample was randomly selected to participate in audio-recorded, semi-structured interviews (n=28) and a subsample of these BCS (n=15) participated in a consensus-building conference call. Needs assessment data were analyzed using descriptive statistics. Transcribed interviews and discussions were evaluated by the coding team using a thematic content analysis approach and consensus review. Several key characteristics of intervention components emerged including: being user-friendly, accessible, and encouraging; integrating the Fitbit with other intervention components; providing a progressive PA prescription with measurable progress; allowing interaction with other users and a clear linkage to evidence-based BCS information. Based on consensus with BCS, the “core” Fit2Thrive intervention will consist of a Fitbit, educational materials and a basic PA tracking mobile application (app). The five key components identified for testing in the MOST trial are: a “deluxe” app including BCS specific content and enhanced feedback, an online gym membership, assignment to a supportive “team” of BCS; behavioral coaching calls and motivational text messages. Engaging BCS in the development of Fit2Thrive intervention components has the potential to result in more effective components with greater patient acceptance. Having elicited these key intervention

themes from BCS, we will now test the comparative, interactive, and optimal dose of these five components in the Fit2Thrive trial using MOST.

Paper Session 11: Approaches to Increase Cancer Screening 3:00 PM-3:18 PM

ACADEMIC-COMMUNITY PARTNERSHIP TO TEST STRATEGIES TO PROMOTE COLORECTAL CANCER SCREENING AMONG PRIMARY CARE LATINO PATIENTS

Sheila F. Castaneda, PhD[1], Balambal Bharti, Staff Res Assoc[2], Rebeca Espinoza Giacinto, MA/MPH, PhD[3], Shawne O'Connell, Fatima Munoz, Sylvia Mercado, Marie Elena Rojas, Wendy Rojas, Gregory Talavera, MD[4], Samir Gupta, MD[2]

[1]San Diego State University, San Diego, CA; [2]University of California, San Diego, La Jolla, CA; [3]San Diego State University/UC San Diego, Auburn, CA; [4]SDSU, Chula Vista, CA

Background: Colorectal cancer (CRC) is the second leading cause of cancer-related death in the US. Screening for CRC can reduce incidence and mortality, but participation rates remain low among low-income, unacculturated Latino adults.

Methods: This academic-community clinic partnership conducted two distinct pilot studies testing the implementation of evidence-based interventions to promote fecal immunochemical test (FIT) screening among Latino patients aged 50-75 years who were not up-to-date with CRC screening (n=200) at a large Federally-Qualified Health Center (FQHC) in the US-Mexico border region of San Diego, CA. One pilot focused on an inreach intervention including a 30 educational minute session with a patient navigator, review of a “flip-chart”, and a take-home FIT kit with instructions. The second pilot was an outreach intervention consisting of mailed print materials (i.e., FIT kit, culturally and linguistically tailored instructions, and a pre-paid return envelope). Both groups received patient navigator-based follow-up to promote FIT completion and referrals for additional diagnostic follow-up and treatment if needed. The primary outcome was measured by return of FIT kit within three months follow-up and was assessed using electronic medical records (EMR).

Results: The in-reach pilot consisted of mostly insured (85%), women (82%) and Spanish-speaking (88%) patients. The outreach pilot consisted of mostly insured (50%), women (64%) and Spanish-speaking (73%) patients. At three months follow-up, screening completion was 76% for in-reach, and 19% for outreach. The median time for in-reach to have FIT results in the EMR was 16 days as compared to 46 days for outreach.

Conclusion: These data demonstrate that evidence-based strategies to promote CRC screening can be implemented successfully within FQHCs, but implementation may require setting and population-specific optimization. Patient-, provider- and healthcare system related implementation issues and lessons learned from this study will be discussed.

Paper Session 11: Approaches to Increase Cancer Screening 3:19 PM-3:36 PM

AFFECTIVE COMPONENTS OF RISK MEDIATE THE RELATION BETWEEN COGNITIVELY-BASED PERCEIVED RISK AND COLONOSCOPY INTENTIONS

Lynne B. Klasko-Foster, N/A[1], Deborah O. Erwin, PhD[2], Lina Jandorf, MA[3], Marc T. Kiviniemi, BA, PhD[4]

[1]State University of New York at Buffalo, Buffalo, NY; [2]Roswell Park Cancer Institute, Buffalo, NY; [3]Icahn School of Medicine at Mount Sinai, New York, NY; [4]University at Buffalo, Buffalo, NY

Early detection through routine colonoscopy has been linked to reduced mortality from colorectal cancer (CRC), but uptake remains low, especially for African Americans as compared to non-Hispanic whites. Cancer risk processing involves both affective components (fear, worry) and cognitive components (beliefs about the chances of getting cancer). Previous work has shown that colonoscopy uptake is related to perceived risk, but less is known about how these risk components work together to impact decision-making. Guided by the Behavioral Affective Associations Model (BAAM), this study examines how both affective and cognitive components of risk influence colonoscopy intentions. 605 African American participants, ages 50 and older and eligible for colonoscopy screening in the next year completed surveys assessing affective (cancer worry and fear) and cognitively-based (absolute and comparative) perceived risk of CRC, future screening intentions, and demographic characteristics. Regression analysis was used to model both components of risk as predictors of screening intentions, controlling for demographic variables. Bootstrap estimates for modeling the indirect effects of affective perceived risk as a mediator of the relation between cognitive perceived risk and screening intentions were conducted. Both affective and cognitively-based perceived risk predicted screening intentions when controlling for sociodemographic variables (all bs>0.14, all ps < 0.05). Cancer fear fully mediated the absolute risk to intentions relation and both fear and cancer worry mediated the comparative risk to intentions relation (all indirect effects>0.05, all ps < 0.05). These findings suggest that affective components of risk play an important role in determining CRC screening intentions for age-eligible African Americans. Given the potential impact of colonoscopy, educational strategies highlighting the effectiveness of screening and the risks associated with non-compliance are necessary to increase health equity. While cognitive risk appraisals also influence decision-making, this study reaffirms findings of the BAAM that affectively-based perceived risk influences decision-making by mediating cognitions and should be incorporated in cancer screening interventions.

ACCEPTABILITY OF A VIRTUAL PATIENT EDUCATOR TABLET APPLICATION TO INCREASE CERVICAL CANCER SCREENING KNOWLEDGE AMONG LATINAS

Janna Gordon, M.S. [1], Laura Barnes, PhD[2], Gloria Arroyo, N/A[3], Patricia Medina-Ramirez, MPH, CPH[4], Sara Proctor, PA, AA[5], Kristen Wells, Ph.D., MPH[6]

[1]SDSU/UC San Diego Joint Doctoral Program in Clinical Psychology, San Diego, CA; [2]University of Virginia, Charlottesville, VA; [3]San Diego State University Research Foundation, San Diego, CA; [4]University of South Florida, Tampa, FL; [5]Catholic Mobile Medical Services, Dover, FL; [6]San Diego State University, San Diego, CA

Latinas experience higher cervical cancer (CC) incidence and mortality compared to the U.S. general population. Many Latinas lack access to health care and experience literacy, communication, and knowledge barriers to CC screening. The current study developed a Virtual Patient Educator (VPE), a Spanish-language, interactive multimedia application in which an embodied conversational agent provides CC and human papillomavirus education. Developed using user-centered design, the VPE includes 15 content segments presented by an animated virtual human using oral explanations accompanied by diagrams. The VPE also includes 4 segments assessing understanding of the VPE content. Participants not up to date with recommended CC screening used the VPE and completed a Spanish-language adaptation of the Unified Theory of Acceptance and Use of Technology questionnaire (UTAUT) and a demographic survey. The UTAUT measures technology acceptability in the following areas (scores range from 1 to 5): anxiety, attitude towards technology, perceived enjoyment, perceived ease of use, perceived sociability, perceived usefulness, and trust. Exploratory analyses evaluated associations of VPE acceptability with age, education, and employment status. Patients (N = 32; mean age: 41.3; mean education: 5.4 years; 50% employed) demonstrated high overall VPE acceptance (M = 3.96), as well as perceived enjoyment (M = 4.34), perceived sociability (M = 4.30), perceived usefulness (M = 4.25), and trust (M = 4.25). Older patients had less positive attitudes about the VPE and were more anxious about using it (ps < .05). Education was negatively associated with anxiety and positively associated with all other subscales (ps < .05). Women who were currently employed rated the VPE as more enjoyable and more trustworthy compared to unemployed women (ps < .05). In conclusion, the VPE is accepted by patients and may be used to augment health education, especially among younger, more educated, and employed Latinas.

RESULTS OF THE VIRGINIA COOPERATIVE EXTENSION 80% BY 2018 INITIATIVE: PROMOTING COLORECTAL CANCER SCREENING AND RISK REDUCTION

Carlin Rafie, PhD, RD[1], Bryan C. Anderson, N/A[2], Noelle Voges, MPH[3], Lindsay Hauser, MS[4], Lindsay Vander Molen, N/A [5]

[1]Virginia Polytechnic Institute and State University, Blacksburg, VA; [2]Virginia Polytechnic Institute and State University, Christiansburg, VA; [3]University of Virginia Cancer Center, Charlottesville, VA; [4]University of Virginia, Charlottesville, VA; [5]Virginia Tech, Blacksburg, VA

Background: Colorectal cancer (CRC) is the third leading cause of cancer-related death in the U.S, yet is highly preventable and detectable through healthy lifestyles and screening. Virginia Cooperative Extension (VCE) provides community education in all 107 counties in Virginia. VCE joined the national 80% by 2018 CRC screening initiative in 2016, and implemented an internal web-based CRC screening and risk reduction program.

Methods: An online survey informed by the Health Belief Model (HBM) was distributed to all VCE personnel and the results were used to develop the organization-wide program. A communications plan was developed to address screening barriers identified in the survey. Four web-based programs were adapted from an existing "Colorectal Cancer Free Zone (CCFZ)" intervention and addressed: 1) screening and insurance coverage, 2) diet, 3) physical activity and weight management, and 4) personnel testimonials. Sessions were facilitated by an Extension Specialist and topic expert. "VCE CRC champions" were recruited from each of 4 state VCE districts to encourage personnel engagement. A program website and Twitter account with scheduled tweets were created to facilitate communication. Personal action was encouraged, including signing a CCFZ pledge.

Results: The initial survey had a 33% response rate (288/ 872) and indicated positive responses to HBM questions. Respondents expressed negative health beliefs, however, about barriers to screening (22%) and perceived severity of CRC (26%). Communication efforts targeted these two areas. The 4 web-based programs were viewed live by 139 participants, representing 42 out of 107 Virginia counties. An additional 47 individuals viewed program recordings available on the website. 122 (87.8%) viewers completed post-session assessments. Of these, 50% signed the CCFZ pledge, 42% took action to get screened, and 65% spoke with someone about colorectal cancer. Actions taken after viewing the sessions included increased fruit and vegetable intake (52%), decreased red and processed meats (32%), increased fiber intake (32%), and increased exercise (35%).

Conclusions: A web-based colorectal cancer screening and prevention initiative implemented within Virginia Cooperative Extension and informed by responses to a survey based on the Health Beliefs Model resulted in a significant percentage of participants taking actions to get screened, reduce risk, and tell others about colorectal cancer. Personal action toward screening and healthy lifestyle change by Extension Agents is essential for effective community education about colorectal cancer. A program toolkit of the initiative is being developed for use by Extension Agents to promote colorectal cancer screening and risk reduction in the communities they serve.

Paper Session 11: Approaches to Increase Cancer Screening 4:13 PM-4:30 PM

USABILITY AND ACCEPTABILITY OF LUCAS CHOICES: A DECISION AID TO SUPPORT INFORMED DECISION MAKING ABOUT LUNG CANCER SCREENING

Jamie L. Studts, PhD[1], Christina R. Studts, PhD, LCSW[2], Richard J. Thurer, MD[3], Margaret M. Byrne, PhD[4]

[1]University of Kentucky College of Medicine, Lexington, KY; [2]University of Kentucky College of Public Health, Lexington, KY; [3]Miller School of Medicine University of Miami, Miami, FL; [4]University of Miami, Miami, FL

Purpose: Decision support tools (DST) have been advocated as a vital component of implementing high quality lung cancer screening (LCS), and patient decision aids (PtDA) have been integrated as an essential component of federal lung cancer screening policy. Further use of PtDAs during shared decision making consultations prior to screening constitute a reimbursable health service. However, there are currently no targeted LCS available in the literature that have been rigorously evaluated and determined to be evidence-based with regard to their ability to improve knowledge, clarify values, and facilitate shared decision making. This study assessed the usability and acceptability of LuCaS CHOICES, a web-based LCS PtDA/DST to facilitate high quality lung cancer screening decisions, in comparison against the NCI LCS website.

Methods: This study involved a randomized controlled feasibility and acceptability trial comparing the LuCaS Lung Cancer Screening (LuCaS) CHOICES decision aid and the NCI website for LCS. Outcomes addressed several aspects of usability and user acceptability and were assessed at 2 weeks and 4 months after baseline. Participants (n=50) were recruited from the Miami, Florida area and from rural areas in eastern Kentucky (Appalachia). Survey measures administered at 2 week follow up included user ratings of PtDA usability and acceptability as well as satisfaction ratings for individual components of LuCaS CHOICES.

Results: Fifty participants at increased risk for lung cancer were recruited from Miami (n=25) and rural Kentucky (n=25). All completed baseline surveys, and 44 individuals completed the 2 week follow up (88% retention rate). Average age of participants was 52.6 years (SD 5.1), and 77% of participants were female. The sample was moderately diverse: 63% White, 34% Black, and 16% Hispanic or Latino. Ratings of intervention usability, satisfaction and acceptability were favorable for both websites, but there were no statistically significant differences between the two PtDA conditions. The LuCaS CHOICES participants trended toward higher decision facilitation (*p*=.09). Acceptability ratings for the LuCaS CHOICES risk calculator,

question prompt list, and conjoint exercise were also favorable (means ~ 5.0/7.0).

Conclusions: Overall, there was a high level of usability and user satisfaction for both PtDAs. Participant ratings suggested that both websites provided valuable information to facilitate informed LCS decision making. Ongoing research will evaluate a range of decision efficacy outcomes as well as the behavioral impact of these tools on patient-provider communication and LCS uptake. There is a need for rapid development and rigorous testing of PtDAs to fulfill the promise of lung cancer screening as a strategy to reduce lung cancer mortality.

PROVISION OF TECHNOLOGY TO FACILITATE POST-ARRIVAL MONITORING FOR EBOLA AMONG TRAVELERS TO THE U.S.

Abbey Wojno, PhD[1], Heather Joseph, MPH[2], Christine E,. Prue, PhD[2], Mihaela Johnson, PhD[3], Peyton Williams, N/A[4], Brian G. Southwell, PhD[5]

[1]Centers for Disease Control and Prevention, Decatur, GA; [2]Centers for Disease Control and Prevention, Atlanta, GA; [3]RTI International, Research Triangle Park, NC; [4]RTI International, Research Triangle Parl, NC; [5]RTI International, Research Park Triangle, NC

Although technology can facilitate symptom monitoring and self-reporting during infectious disease outbreaks, relevant participants may not have access to such tools. We investigated that possibility during the 2014-2016 Ebola epidemic after the Centers for Disease Control and Prevention (CDC) recommended post-arrival monitoring for travelers arriving in the United States from countries with Ebola outbreaks, including health checks and daily reporting to public health authorities. To facilitate monitoring, CDC began the CARE+ (Check and Report Ebola Plus) program to provide travelers with information, a cellular phone, and digital thermometer. We analyzed three waves of interviews with travelers arriving to John F. Kennedy and Washington Dulles International Airports in 2015: an airport intercept (n=1,195), a first telephone follow-up (TFU1) 3-5 days post arrival (n=654), and a second follow-up (TFU2) 1-2 days before the end of monitoring (n=319).

Approximately 51% of travelers indicated not having access to a thermometer upon arrival. Travelers with passports from Sierra Leone, Liberia, and Guinea, compared to U.S. passport holders, were significantly less likely to have a thermometer ($p < .001$). At TFU1, 98% of travelers reported having used the CARE+ thermometer.

Roughly 36% of travelers reported not having a working cell phone other than the CARE+ phone provided. Travelers with passports from countries with Ebola outbreaks were less likely to have a cell phone than U.S. passport holders ($p < .001$). Travelers reported high use of the CARE+ phone. At TFU1, 81% of respondents had been contacted by a public health authority via CARE+ phone; 67% of travelers at TFU1 and 77% of travelers at TFU2 used the CARE+ phone to report daily to the health department. U.S. passport holders reported less CARE+ phone usage compared to those with passports from countries with Ebola outbreaks ($p < .001$).

Providing cell phones and thermometers met travelers’ reported needs and facilitated monitoring behavior.

USER CENTERED DESIGN OF A REAL-TIME PATIENT SAFETY DASHBOARD

Bryan Gibson, DPT, PhD[1], Jorie Butler, PhD[2], Leah Yinglling, BS[3], David Classen, MD MS[4]

[1]University of Utah, Salt Lake City, UT; [2]University of Utah, SALT LAKE CITY, UT; [3]University or Utah Department of Biomedical Informatics, Salt Lake City, UT; [4]university of utah, salt lake city, UT

Background: Nearly one third of patients are harmed in U.S. hospitals annually. Currently, healthcare organizations are seeking to use Health Information Technology to reduce patient harm through the early detection of safety problems and alerting of healthcare providers. One existing initiative is a provider-facing patient safety dashboard that presents a list of safety events and a related global safety risk score for each patient in a panel. The goal of this project was to design a patient-facing real-time safety dashboard (My Safety Advisor) that aims to educate and motivate patients to engage with their care team.

Methods: An interdisciplinary team of a health psychologist, an informaticist and a clinician, conducted four user-centered design sessions with 32 recently hospitalized patients and their caregivers between February and June 2016. Each semi-structured, moderated session began with individuals sharing personal stories of recent hospitalizations and any safety events that occurred. We then solicited input on the contemporaneous iteration of the interface design. Design sessions were audio-recorded and transcribed. Transcriptions were loaded into ATLAS.ti and analyzed for themes relevant to design and functionality of My Safety Advisor.

Results: Themes derived from the user-centered design sessions drove the iterative design of the patient-facing My Safety Advisor dashboard. For example, it was observed that patients fail to associate specific safety events with appropriate follow-up questions or corrective actions (as providers do). To meet this need, the patient-facing dashboard design was modified to include a table that connects each safety issue with links for “Questions you should ask” and “Things you can do,” instantiating the theme “show me the links.” Similarly, the detailed display of an individual’s risk over time, originally designed for high numeracy providers, was simplified to an icon-centric display intended for lower numeracy lay people,

thus instantiating the theme “keep it simple.” Other themes included “provide an analogy” and “use simple language.”

Conclusion: We present the user-centered design of a real-time patient safety dashboard. We will discuss how this qualitative work led to an experiment of the effect of design features of the dashboard on anxiety and risk perception and whether the themes derived from this work may generalize to other presentations of risk-related information to patients.

USING SOCIAL MEDIA TO TARGET NICHE POPULATIONS: THE SEARCH FOR CONSUMERS OF ONLINE DNA INTERPRETATION SERVICES

Tiernan J. Cahill, MA[1], Blake Wertz, MA[2], Qiankun Zhong, Master[3], John Donegan, MBA, MA[4], Rebecca J. Forman, Master's Degree[5], Supriya Manot, M.A.[6], Andrew M. Parlato, M.A. Emerging Media Studies[7], Tianyi Wu, Master[8], Yazhu Xu, master student[9], James J. Cummings, Ph.D.[1], Tricia Norkunas, MA, MPH[10], Catharine Wang, PhD, MSc[11]

[1]Boston University, Boston, MA; [2]Boston University: College of Communication, Boston, MA; [3]Emerging media studies, Boston, MA; [4]Boston University, East Orleans, MA; [5]Boston University, Brighton, MA; [6]Boston University College of Communication, Newton, MA; [7]Boston University College of Communication, Boston, MA; [8]Boston University, Beijing, N/A, China (People's Republic); [9]School of Communication, Boston University, Tilburg, Noord-Brabant, Netherlands; [10]Boston University School of Public Health, Bostom, MA; [11]Boston University School of Public Health, Boston, MA

In order to study users of online third party raw DNA interpretation services— a ‘niche’ population estimated to include only a fraction of a percent of the US population— this study explored recruitment via social media platforms. Multiple social media platforms were compared to investigate the viability of distributing surveys via social media. Using a 2x2 factorial design, a survey was distributed on two of the most prominent social media platforms, Facebook and Twitter, using two different types of advertising structures. Advertisements were either “cost-per-click” (CPC) which allowed researchers to target those who liked or commented about relevant topics such as *genetics,* or “cost-per-conversion” (CPV) which began from the same targeting criteria used in cost-per-click methods but iteratively re-targeted the survey based on the characteristics of users who submitted completed questionnaires. Payment occurred either each time an advertisement link was clicked (CPC) or for each completed survey (CPV). Researchers also distributed the same survey for free on Reddit, by identifying and posting a link to the survey on relevant sub-communities (subreddits). A total of 545 surveys were completed over a two-week distribution period, 100 ($2.50/each) from Facebook CPC, 120 ($2.08/each) from Facebook CPV, 35 ($7.04/each) from Twitter CPC, 155 ($1.61/each) from Twitter CPV and 135 ($0/each) from Reddit, making Twitter CPV the most cost-effective paid method. Although Reddit distribution was free, this organic distribution could not easily be achieved on other platforms due to systemic features, and there is reason to conclude that this number was relatively close to saturation while the same cannot be said for advertisement. Platforms differed on

participant demographics, yet no significant differences were found within methods using the same platform. Most notably, 83% of respondents on Facebook and Twitter were female (17% male), in contrast to 39% respondents from Reddit (61% male). The average age of Reddit respondents (35 years) was lower than that of respondents from Twitter (53 years) or Facebook (49 years). Researchers interested in conducting surveys on otherwise hard to identify populations may want to consider various social media platforms as an effective means of surveying attitudes and behaviors, mindful of the potential limits and non-representativeness of the respondents.

EFFECTIVENESS OF DVD VS. GROUP-INITIATED DIABETES PREVENTION ON INFORMATION UPTAKE FOR HIGH & LOW HEALTH LITERACY PARTICIPANTS

Cody Goessl, MS, LAT[1], Fabio Almeida, PhD[1], Wen You, Ph.D.[2], Paul A. Estabrooks, PhD[1]

[1]University of Nebraska Medical Center, Omaha, NE; [2]Virginia TEch, Blacksburg, VA

Purpose: To evaluate DVD versus group-initiated diabetes prevention to enhance patient comprehension of educational objectives between high (HHL) & low health literacy (LHL) patients.

Methods: Participants received evidence-based diabetes prevention content through either a DVD or in-person group class. The intervention included physical activity, nutrition, and behavioral components to facilitate a 5 to 10% body weight loss. The content was consistent between conditions, only delivery channel differed. After baseline assessment & watching a DVD or attending a class both focused on diabetes prevention, all participants (n=442; BMI=37.0±6.7; 52.3±12.1 years; 68% women, 17% African American) completed teach-back strategies used to reinforce intervention content. Approximately 51.0% (n=225) and 49.0% (n=217) were assigned to a DVD & class, respectively. Comprehension was operationalized as the proportion of participants correctly answering all the questions in each round. More rounds would reflect lower initial comprehension post-DVD or class. Health literacy was assessed by the Newest Vital Sign test at baseline. Descriptive & chi-square analyses were completed for all comparisons.

Results: The proportion of HHL (n=361) and LHL (n=81) participants was similar between DVD (n=187 HHL; n=38 LHL) and class (n=174-HHL; n=43 LHL) conditions. Overall, the proportion of HHL participants that answered round 1 of the teach back questions correctly was 23% compared to 9% of LHL participants ($p < 0.01$). This pattern of results was consistent for both DVD participants (24% HHL and 11% LHL; $p < .05$) and class participants (23% HHL and 7% LHL; $p < .05$). In the second round of teach-back questions, for participants who answered round 1 incorrectly, 82% of both HHL and LHL participants answered correctly, these numbers increased to 100% and 86%, respectively for round 3. Only 2 LHL participants did not answer all of the questions correctly by round 3.

Conclusion: DVD and class delivery of diabetes prevention materials do not appear to lead to differential uptake of information. However, LHL participants demonstrated a higher need for teach-back, yet, even participants with HHL benefited from the strategy. The use of teach-back as a strategy among diabetes prevention patients may improve knowledge

reinforcement. Thus, teach-back may be a valuable component to any health education intervention.

BENEFITS OF COMMUNAL COPING IN COUPLES WITH TYPE 2 DIABETES LIMITED BY SPOUSE UNMITIGATED COMMUNION

Vicki Helgeson, PhD[1], Howard Seltman, Ph.D.[1], Mary Korytkowski, M.D.[2], Leslie Hausmann, PhD[3]

[1]Carnegie Mellon University, Pittsburgh, PA; [2]University of Pittsburgh, Pittsbugh, PA; [3]VA Pittsburgh Healthcare System, Pittsburgh, PA

When one person in a couple faces a chronic illness, both members of the couple are likely to be affected. Increasingly, research has taken into consideration the social context of coping with chronic disease. Communal coping is one such approach and consists of a shared illness appraisal (i.e., it is “our” problem instead of “my” or “his/her” problem) and collaboration to manage the illness (i.e., joint problem solving). Research has linked communal coping to better patient outcomes. The present study aimed to examine whether a personality trait in spouses, unmitigated communion, moderated those relations. Unmitigated communion refers to over-involvement in others’ problems leading to self-neglect. It is characterized by being overly nurturant, intrusive, and easily exploitable. The extent to which spouse unmitigated communion moderated the relation of spouse communal coping to patient outcomes was examined in a study of 125 couples in which one person was recently diagnosed with type 2 diabetes (mean age = 54 years, 59% white/41% black, 55% male). The study consisted of separate patient and spouse interviews and a behavioral observation task in which couples discussed difficulties managing diabetes. Two independent raters coded spouse communal coping from the behavioral observation task. Results showed that observer ratings of spouse communal coping were associated with higher patient ratings of marital quality, higher patient self-efficacy, higher patient medication adherence, and reduced patient distress. The majority of these relations were moderated by spouse unmitigated communion, such that relations were reduced or eliminated when spouses were high in unmitigated communion. Spouses who were high in unmitigated communion also had higher levels of distress, and their own communal coping was related to fewer benefits in terms of relationship and psychological health if they scored high on unmitigated communion. These results suggest that spouse involvement in illness is not beneficial for patients or spouses when spouses score high on a dispositional variable that reflects intrusion and immersion in relationships.

DAILY STRESS AND SLEEP SATISFACTION IN COUPLES WITH TYPE 1 DIABETES: EVIDENCE OF BIDIRECTIONAL EFFECTS

Eunjin Lee, Ph.D.[1], Cynthia Berg, Ph.D.[1], Katherine J.W. Baucom, Ph.D.[1], Vicki Helgeson, PhD[2]

[1]University of Utah, Salt Lake City, UT; [2]Carnegie Mellon University, Pittsburgh, PA

Sleep and stress play pivotal roles in living a healthy life and are especially important as individuals cope with a chronic illness. When individuals experience a chronic illness such as type 1 diabetes in the context of an intimate relationship, the relation between sleep and stress may be interdependent and experienced as a dyad. We investigated the bidirectional relations of both daily variation in and average levels of diabetes stress, general stress, and sleep satisfaction across 14 days among couples in which one member had type 1 diabetes (*n* = 122 couples M age=45.48). Patients and spouses completed a diabetes stressor checklist indicating whether patients experienced diabetes stressors, whether they experienced general stressors, and rated their own sleep satisfaction. Multilevel modeling using the actor partner interdependence model indicated that when patients reported having higher than their average sleep satisfaction, patients' diabetes stress and spouses' report of patients' diabetes stress were lower the next day. In regards to the effect of sleep satisfaction on general stress, both actor and partner effects were found at the average and daily level. For instance, when patients and spouses reported higher sleep satisfaction than their average level, both their own and their spouse's general stress was lower the next day. Further, when spouses reported patients' diabetes stress was greater than their average, patients' levels of sleep satisfaction were higher, yet their own levels of sleep satisfaction were lower. There may be benefits to patients when their spouses are aware of their diabetes stress. Patients' and spouses' higher average levels of daily general stress predicted lower levels of their own sleep satisfaction. These results suggest the relation between daily stress and sleep satisfaction is bidirectional, and supports the link between stress and sleep as a dyadic process among couples coping with type 1 diabetes.

MERITORIOUS AWARD WINNER

DIABETES RISK PERCEPTION AMONG RACIAL/ETHNIC MINORITY AND IMMIGRANT GROUPS: DATA FROM THE NATIONAL HEALTH AND NUTRITION SURVEY

Loretta Hsueh, M.A.[1], Juan M. Peña, B.A.[2], Adam T. Hirsh, PhD[1], Mary de Groot, PhD[3], Jesse C. Stewart, PhD[1]

[1]Indiana University-Purdue University Indianapolis, Indianapolis, IN; [2]University of New Mexico, Albuquerque, NM; [3]Indiana University School of Medicine, Indianapolis, IN

Individuals from racial/ethnic minority groups are at an increased risk of developing diabetes. Emerging research shows that immigrant (foreign-born) individuals are also at an increased diabetes risk, but less is understood about risk perception in this vulnerable group. Our aim was to examine associations of immigrant status and racial/ethnic minority status with risk perception for developing diabetes among a nationally representative sample of people without diabetes.

Respondents were the 7,983 adults (mean age=47 years, 52% female) from NHANES 2011-2014 who reported no history of diabetes. We coded immigrant status as foreign-born (*n*=2,246, 28%) or U.S.-born (*n*=5,737, 72%). We used the following six NHANES racial/ethnic categories: non-Hispanic White (*n*=3,413, 43%), non-Hispanic Black (*n*=1,722, 22%), Mexican American (*n*=864, 11%), other Hispanic (*n*=731, 9%), non-Hispanic Asian (*n*=1,015, 13%), and other/multi-racial (3%). Diabetes risk perception (yes/no) was assessed by the question: “Do you feel you could be at risk for diabetes or prediabetes?” Immigrant status and five dummy-coded variables comparing each racial/ethnic group to the non-Hispanic White group were simultaneously entered as predictor variables into logistic regression models with diabetes risk perception as the outcome. Models were adjusted for demographic factors (age, gender, education, income) and health risk factors, including diabetes risk factors (HbA1c, self-reported prediabetes diagnosis, family history of diabetes, BMI, CVD, hypertension, hypercholesterolemia, smoking).

A total of 2,360 (30%) reported perceiving that they were at risk for diabetes. Both immigrant status and racial/ethnic minority status were associated with diabetes risk perception. Being foreign-born, versus U.S.-born, was associated with *decreased* odds (*OR*=0.72, 95% *CI*: 0.58-0.91, *p*=0.005) of perceiving a risk for diabetes, while being Mexican American (*OR*=1.80, 95% *CI*: 1.36-2.37), non-Hispanic Asian (*OR*=1.47, 95% *CI*: 1.12-1.94), and other/multi-racial (*OR*=2.17, 95% *CI*: 1.62-2.90), versus non-Hispanic White, were associated with *increased* odds

of perceiving a risk for diabetes *(*all *p*s < 0.05). Our findings suggest that, after controlling for actual diabetes risk status, foreign-born adults are less likely to perceive that they are at risk for diabetes than U.S.-born adults. Importantly, lower diabetes risk perception among foreign-born individuals could result in later detection and poorer management of diabetes, thus contributing to immigrant diabetes disparities. Finally, further research is needed to examine the mechanisms underlying the unexpected finding of higher diabetes risk perception among Mexican American and Asian persons without diabetes.

Paper Session 13: Diabetes Across the Lifespan 3:55 PM-4:12 PM

FAMILY BARRIERS TO DIABETES MEDICATION ADHERENCE

Lindsay S. Mayberry, MS, PhD, Kryseana Harper, M.Ed

Vanderbilt University Medical Center, Nashville, TN

Family members and close friends (FF) perform harmful diabetes-specific actions which interfere with adults' self-management of type 2 diabetes (T2D). Experiencing more diabetes-specific harmful actions from FF has been consistently linked to less diabetes medication adherence. However, most identified harmful FF behaviors pertain to diet, exercise, and self-monitoring of blood glucose. Therefore, we sought to identify medication adherence-specific harmful FF actions experienced by adults with T2D.

We recruited adults with T2D (n=102) who were receiving care from Federally Qualified Health Centers (FQHCs) in Nashville, TN to complete a survey and a lab drawn A1c test. We identified six ways FF may interfere with patients' diabetes medication adherence and participants indicated which they had experienced within the past 30 days. We examined bivariate associations between the number of harmful FF actions endorsed by participants and age, gender, race/ethnicity, marital status, depressive symptoms (Patient Health Questionnaire-2), diabetes duration, insulin status, medication adherence (Adherence to Refills and Medications Scale for Diabetes) and A1c using non-parametric tests (Spearman's ρ/Mann-Whitney U). Last, we regressed medication adherence and, separately, A1c on to the number of harmful FF actions endorsed, adjusted for a priori covariates (age, gender, race/ethnicity, marital status, depressive symptoms, diabetes duration, insulin status).

Participants reported family priorities made it difficult to take medication regularly (27%), FF gave annoying medication reminders (21%), FF attempts to help with patient adherence led to conflict (20%), and FF judged patients for taking diabetes medications (17%). Less frequently, participants reported FF gave inaccurate information about (6%) or disapproved of (6%) medications. Fifty-seven percent endorsed at least one diabetes medication-specific harmful FF action and endorsing more of these actions was associated with younger age ($\rho=-.23$, $p < .05$), higher depressive symptoms ($\rho=.22$, $p < .05$), less medication adherence ($\rho=-.35$, $p < .001$), and worse A1c ($\rho=.28$, $p < .01$). In adjusted regression models, more FF harmful actions remained significantly associated with worse medication adherence ($\beta=-.58$, $p < .01$) but not with A1c.

Over half of our patient sample reported recently experiencing one or more harmful FF actions specific to diabetes medication adherence. Experiencing more harmful FF actions was associated with more depressive symptoms and worse A1c and independently associated with worse medication adherence. Family interventions for adults with T2D should attend to these medication-specific harmful FF actions to support improved patient adherence.

Paper Session 13: Diabetes Across the Lifespan 4:13 PM-4:30 PM

DEPRESSIVE SYMPTOMS MODERATE LINKS BETWEEN SELF-REGULATION AND TYPE 1 DIABETES MANAGEMENT IN LATE ADOLESCENTS

Deborah Wiebe, MPH, PhD[1], Katherine J.W. Baucom, Ph.D.[2], Kristin Wolfe, MRC[3], Seth Silva, Bachelor of Arts, Psychology[4], Bryce A. Huntbach, Psychology, BS (Expected Fall 2016) [2], Cynthia Berg, Ph.D.[2], Yana Suchy, Ph.D.[2]

[1]University of California, Merced, Merced, CA; [2]University of Utah, Salt Lake City, UT; [3]University of Texas, Southwestern Medical Center, Dallas, TX; [4]University of California, Merced, Turlock, CA

Late adolescents and emerging adults have poorer management of type 1 diabetes compared to younger adolescents and adults. This may be because they have high levels of depressive symptoms (DS) that undermine the self-regulatory skills and processes necessary to manage diabetes. Prior research demonstrated that those with lower self-regulatory capacity (i.e., problems with executive functions; EF) have poorer management, but that even those with good EF display daily self-regulation failures (e.g., forgetting to test blood glucose) that disrupt diabetes adherence on a daily basis. Such regulatory disruptions may be more common and more damaging for those with DS. The present study used survey and daily diary methods to examine whether DS: a) are associated with poorer self-regulation (i.e., EF skills and daily self-regulation) and b) moderate associations between self-regulation and diabetes outcomes (adherence, blood glucose control). Late adolescents with type 1 diabetes > 1 year were recruited during their senior year of high school (N=247; 60% female; M = 17.8 yrs old). Participants completed cognitive testing to obtain objective measures of EF, and surveys to measure DS and adherence; a blood sample was provided to assay HbA1c as a measure of glycemic control. Subsequently, participants completed a 14-day diary protocol, reporting on daily self-regulation failures and adherence through brief surveys at the end of each day. DS were correlated with poorer EF skills, r= -.22, adherence, r= -.33, and HbA1c, r=.24, *p*s < .001. Interactions revealed higher DS were particularly problematic for adherence and glycemic control among those with lower EF skills, ps < .05. Multilevel modeling of diary data indicated those with higher DS had, on average, more daily self-regulation failures and poorer daily adherence over the subsequent 2 weeks, *p*s < .001. On days participants had higher self-regulation failures, they also reported poorer adherence, and this association was present even after the effect of DS on average levels of self-regulation failures was covaried. Further, DS moderated the daily association of self-regulation failures with poorer adherence, indicating a stronger association among those with higher DS, t = -2.39, p < .05. Findings

identify those who are more at risk for poor diabetes management (high DS, poor EF), and the potential processes (disrupted daily self-regulation) that may be targeted for intervention.

ACCEPTANCE AND COMMITMENT THERAPY FOR CANCER SURVIVORS WITH FEAR OF RECURRENCE: RESULTS OF A 3-ARM RANDOMIZED CONTROLLED PILOT

Shelley A. Johns, PsyD, ABPP[1], Andrea A. Cohee, PhD[2], Kathleen Beck-Coon, MD[2], Linda Brown, PhD[3], Michelle L. LaPradd, MS MBA[4], Patrick Monahan, PhD[4]

[1]Indiana University School of Medicine, Indianapolis, IN; [2]Indiana University School of Nursing, Indianapolis, IN; [3]Indiana University School of Medicine, Bloomington, IN; [4]Indiana University, Indianapolis, IN

Fear of cancer recurrence (FCR) is one of the most prevalent, persistent, and disruptive sources of distress for adult cancer survivors. After completing treatment, 44-56% of survivors continue to report clinically significant FCR well into disease-free survivorship. FCR is associated with maladaptive coping and reduced quality of life. Despite being the most frequently identified unmet supportive care need reported by survivors, few empirically supported treatments exist for FCR.

The primary objective of this 3-arm randomized controlled pilot was to assess feasibility and preliminary efficacy of Acceptance and Commitment Therapy (ACT) in reducing FCR and cancer-related avoidant coping compared to a survivorship education (SE) intervention and to enhanced usual care (EUC). The ACT and SE interventions were delivered in a group format 2 hours weekly for 6 weeks. EUC was largely self-administered with a packet of readings on coping with FCR and other common sources of distress during post-treatment survivorship. Breast cancer survivors (BCS; n=91) diagnosed at an early stage (0-III) who had completed curative treatment and who reported clinically-significant FCR (Fear of Cancer Recurrence Inventory-Short Form score ≥ 13) were randomized to 1 of the 3 arms in a 1:1:1 ratio. Feasibility was assessed descriptively with percentage of eligible BCS who enrolled in the trial, attendance across 6 weekly group sessions (ACT and SE arms), and trial retention (all arms). Intent-to-treat ANCOVA was used to calculate pair-wise Cohen *d* effect sizes between the 3 arms on FCR and cancer-related avoidant coping at post-intervention (T2) and 1-month follow-up (T3), controlling for baseline (T1) scores and covariates.

The majority of participants were White (83.5%) and college educated (64.8%) with an average age of 58.7 years ($SD = 10.7$). Of eligible BCS, 61.7% enrolled in the trial. Retention was 94.5% through T3, and attendance across 6 sessions was 4.95 sessions for ACT and 5.16 sessions for SE with no significant difference between groups ($p = 0.47$). At T2, ACT was superior to SE in reducing FCR (d=0.69, p=0.035) and cancer-related avoidant coping ($d = 0.66$, $p = 0.037$). Similarly at T3, ACT was superior to SE in reducing FCR ($d = 0.66$, $p = 0.023$) and

cancer-related avoidant coping (*d* = 0.83, *p* = 0.002). The only significant difference favoring ACT over EUC was on decreased cancer-related avoidant coping at T2 (*d* = 0.68, *p* = 0.046), with marginal superiority of ACT over EUC on decreased cancer-related avoidant coping at T3 (*d* = 0.59, *p* = 0.078). No significant differences between SE and EUC emerged at any time point.

Findings suggest that ACT is a promising intervention for BCS with clinically-significant FCR and warrants a fully powered efficacy trial.

Paper Session 14: Life After Diagnosis: Planning for Recurrence and End of Life 3:19 PM-3:36 PM

PERFECTIONISM AND PSYCHOLOGICAL COMORBIDITY AMONG CANCER PATIENTS: A LONGITUDINAL ANALYSIS

Josée Savard, Ph.D.[1], Marie-Hélène Savard, Ph.D.[2]

[1]Université Laval, Québec, PQ, Canada; [2]CHU de Québec-Université Laval Research Center, Québec, PQ, Canada

Background: Symptoms experienced by cancer patients (e.g., anxiety, depression, insomnia) frequently occur in comorbidity, suggesting a shared etiology. Data from the general population suggests that perfectionism constitutes a possible psychological transdiagnostic process underlying many cancer-related symptoms. The goal of this study was to investigate whether perfectionist patients experience psychological symptoms to a greater extent during the cancer trajectory. **Methods:** A total of 962 cancer patients (mixed sites) completed self-report measures at the peri-operative phase (T1), as well as 2 (T2), 6 (T3) 10 (T4), 14 (T5) and 18 (T6) months after. Measures included the Multidimensional Perfectionism Scale (MPS; baseline only), the Hospital Anxiety and Depression Scale (HADS), the Fear of Cancer Recurrence Inventory (FCRI), the Multidimensional Fatigue Symptom Inventory (MFI), the Cognitive Failures Questionnaire (CFQ) and the Insomnia Severity Index (ISI). **Results:** 24.6% of the participants showed a clinical level of perfectionism (i.e. score ≥ 25 on the MPS Concern over mistakes subscale) at baseline. This subset of patients consistently reported more severe symptoms (depression, anxiety, fear of cancer recurrence, fatigue, cognitive disturbances and insomnia) throughout the 18-month period. Moreover, perfectionist patients were at least twice as likely as non-perfectionists to report clinical levels of 3 or 4 symptoms concurrently. **Conclusions.** These results suggest that perfectionism is a risk factor of multiple cancer-related psychological symptoms. Perfectionism may represent a critical common underlying process that could be addressed in psychological interventions to reduce symptom comorbidity and the overall burden of cancer on patients and society.

EARLY INTEGRATED PALLIATIVE CARE FOR PATIENTS WITH ADVANCED LUNG AND GASTROINTESTINAL CANCER: WHAT ARE THE KEY ELEMENTS?

Michael Hoerger, PhD, MSCR[1], Jennifer S. Temel, MD[2], Vicki A. Jackson, MD, MPH[3], Elyse R. Park, PhD, MPH[3], William F. Pirl, MD, MPH[4], Areej El-Jawahri, MD[3], Emily R. Gallagher, RN[3], Teresa Hagan, PhD, RN[3], Juliet Jacobsen, MD[3], Joseph A. Greer, PhD[2]

[1]Tulane University, New Orleans, LA; [2]Massachusetts General Hospital Cancer Center/Harvard Medical School, Boston, MA; [3]Massachusetts General Hospital, Boston, MA; [4]University of Miami Hospital, Miami, FL

Background: Early integrated palliative care (PC) has been shown to improve quality of life and mood in patients with advanced cancer. Yet, a barrier to dissemination is insufficient data about the essential components of the care model. The goal of this study was to identify core elements of integrated PC across the illness trajectory and examine whether variation in the focus of PC visits was associated with changes in quality of life and mood at follow-up.

Methods: Participants (n = 175) were patients with incurable lung or non-colorectal gastrointestinal cancer who were randomized to receive early integrated PC in the intervention arm of an NIH-funded RCT. Patients completed psychosocial surveys at baseline, 12 weeks, and 24 weeks assessing quality of life (Functional Assessment of Cancer Therapy – General, FACT-G), depression (Hospital Anxiety and Depression Scale, HADS; Patient Health Questionnaire – 9, PHQ-9), and anxiety (HADS). Clinicians completed post-visit surveys identifying the elements they focused on in each palliative care visit. Analyses examined the proportion of visits with particular areas of focus (overall, initial 3 visits, middle visits, final 3 visits) and whether the proportion of visits-to-date at 12 and 24 weeks with a given focus was associated with changes in quality of life and mood.

Results: Throughout the illness trajectory, PC visits focused predominantly on two core elements: coping (64.7%) and symptom management (74.7%). Key coping processes were counseling, behavioral strategies, and redirecting hope. Symptom management focused most on pain and fatigue. Palliative care clinicians focused on building rapport in the initial 3 visits, decision making and advanced care planning in the final 3 visits, and illness understanding throughout. At 24 weeks, patients who had a higher percentage of their visits focused on coping experienced more favorable changes in quality of life on the FACT-G (total score: $\beta = .23$, $p = .006$; social well-being: $\beta = .21$, $p = .02$; functional well-being: $\beta = .17$, $p = .03$) and

symptoms of depression on the HADS (β = -.27, p = .002) and PHQ-9 (PHQ-9: β = -.24, p = .002).

Conclusions: Focusing on coping and symptom management are two key hallmarks of early integrated palliative care for patients with advanced cancer. The role of coping in the care model warrants further attention, as focusing on coping was associated with favorable changes in quality of life and mood.

Paper Session 14: Life After Diagnosis: Planning for Recurrence and End of Life 3:55 PM-4:12 PM

ADVANCED CANCER PATIENT-CAREGIVER ACCURACY OF AND AGREEMENT ON LIFE EXPECTANCY AND ASSOCIATIONS WITH ADVANCE CARE PLANNING

Kelly Trevino, PhD, Megan Shen, PhD, Holly Prigerson, PhD

Weill Cornell Medicine, New York, NY

Background. Many advanced cancer patients have an inaccurate understanding of their prognosis, which is associated with less engagement in advance care planning (ACP). This study examined patient-caregiver dyads' accuracy of and agreement on estimates of patients' life expectancy (LE) and the relationship between agreement and accuracy and rates of ACP.

Method. Data were collected as part of a multi-site longitudinal study of terminally-ill cancer patients (LE≤6 months) and their informal caregivers. Patients and caregivers (n=178 dyads) completed an interviewer-administered survey (median 3.05 months before patient's death) assessing their estimates of patients' LE. ACP was assessed through patient-report. Accuracy was defined as a LE estimate for the patient of ≤6 months. Concordance was defined as patient-caregiver dyads agreeing on LE estimates (≤6 months or >6 months). Logistic regression analyses were conducted.

Results. Across all dyads, 14.6% of patients and 28.1% of caregivers reported accurate LE estimates. A majority of the dyads (76.4%) reported concordant LE estimates. Only 9.6% of dyads reported concordant and accurate LE estimates. Over two-thirds of dyads (66.9%) reported concordant but inaccurate estimates. Approximately one-fifth (18.5%) of dyads were discordant with an accurate caregiver estimate; 5.1% were discordant with an accurate patient estimate. Patients were more likely to have a completed DNR order in concordant-accurate (OR=10.80, p < .01) and discordant dyads (patient accurate: OR=16.20, p=.01; caregiver accurate: OR=2.47, p=.03) than in concordant-inaccurate dyads. Patients were more likely to have a HCP in concordant-accurate (OR=10.74, p=.02) and discordant dyads in which the caregiver was accurate (OR=2.49, p=.050) than concordant-inaccurate dyads. Patients were more likely to have a living will in concordant-accurate (OR=6.00, p=.02) and discordant dyads in which the caregiver was accurate (OR=2.50, p=.04) than concordant-inaccurate dyads.

Discussion. The majority of dyads share an inaccurate view of LE. Patients are more likely to engage in ACP when they and their caregiver are concordant and accurate in their LE estimates than concordant-inaccurate dyads. In discordant dyads, patient accuracy may promote DNR order completion; caregiver accuracy may support HCP identification and living

will completion. Results suggest interventions targeting patient and caregiver accuracy of and agreement on LE may improve ACP rates.

FEAR OF CANCER RECURRENCE IN PROSTATE CANCER: EXAMINING PATIENT-SPOUSE DYADS FROM PRE-TREATMENT TO 12 MONTHS POST

Heather L. McGinty, PhD[1], Lisa M. Wu, PhD[2], Ali Amidi, PhD[3], Michael A. Diefenbach, Ph.D.[4]

[1]The Ohio State University & James Cancer Hospital and Solove Research Institute, Columbus, OH; [2]Northwestern University, Feinberg School of Medicine, Chicago, IL; [3]Aarhus University Hospital, Aarhus, Midtjylland, Denmark; [4]Northwell Health, Manhasset, NY

Background: Fear of cancer recurrence (FCR) in both cancer survivors and their family caregivers is associated with reduced quality of life and increased psychological morbidity. Furthermore, patients and caregivers may influence each other, potentially exacerbating these problems. Currently, little is known about FCR and its trajectory among prostate cancer patients and their spouses. This study aimed to investigate: i) the trajectory of FCR over time from pre-treatment to post-treatment; ii) the influence of partner FCR over time in patient–spouse dyads; and iii) the possible moderating effect of treatment type upon later FCR.
Methods: A total of 71 men diagnosed with early-stage prostate cancer (PC) and their spouses were followed at baseline prior to treatment (T1), and at two time points after treatment – 6 months (T2) and 12 months after baseline (T3). Participants completed a 2-item measure evaluating FCR on a 5-point Likert scale at each time point. Repeated measures ANOVA examined differences within the dyads over time comparing longitudinal patterns for patients and spouses. Separate actor-partner interdependence models (APIMs) were conducted to examine actor and partner effects on subsequent FCR from T1-T2 and T2-T3, including the effect of treatment type on later FCR.
Results: On average, both members of the dyads reported mild to moderate levels of FCR across all 3 time points. Spouses demonstrated a trend for greater FCR at T1 (p = .06) and reported significantly greater FCR than patients at T2 and T3 (ps > .01). Patient and spouse FCR were moderately correlated over time (r = .36 at T1; r = .35 at T2; r = .19 at T3). Both members of the dyads had significant decline in FCR over time (p < .001), with a trend for patient FCR to decrease at a faster rate compared to spouses (p = .12). APIMs demonstrated significant actor, but not partner effects for T1-T2 and T2-T3 models. Receiving surgery was significantly related to less FCR in spouses at T2 (p = .01); surgery was unrelated to FCR at T3 for either member of the dyad.
Conclusions: FCR is common in patient-spouse dyads and gradually declines over the first year following treatment for early-stage PC. Spouses report greater FCR than patients and tend to exhibit slower decline in fear over time. Patient and spouse FCR, while moderately correlated, does not appear to impact one another over time. The impact of surgical intervention appears

to reduce FCR for spouses more than for the patients. Future research should examine how FCR relates to other types of distress and quality of life in dyads over time.

Paper Session 15: Food Access and Availability 3:00 PM-3:18 PM

WORKING UPSTREAM TO IMPACT DIETARY BEHAVIOR CHANGE: CHARACTERIZING RURAL FOOD ACCESS IN REMOTE AREAS

Courtney Pinard, PhD[1], Chris Bardenhagen, JD[2], Rich Pirog, M.S., B.A.[2], Amy Yaroch, PhD[1]

[1]Gretchen Swanson Center for Nutrition, Omaha, NE; [2]Michigan State University Center for Regional Food Systems, East Lansing, MI

Introduction: Diet-related environmental and policy interventions are advantageous at a population level since individual change is more likely to be facilitated and sustained if the environment supports healthful food options. The current study characterized rural food retail and healthy food access in the rural northeast region of Michigan to provide more information on specific needs within this predominately rural region.

Methods: A 15 county region of rural northeast Michigan was assessed through triangulating a combination of three secondary data sources, store observations using a customized tool, and key informant interviews.

Results: Secondary data yielded over 800 retail food establishments, which were categorized into 15 food retail types (e.g., large chain supermarkets, limited assortment food marts, dollar stores). In-person observations were conducted at 20 stores, which included small grocers/convenience stores without gas (n=7), small or mid-sized grocers with gas (n=6), mid-sized independent retailers (n=5), and limited assortment/food mart/gas stations (n=2). Ready-to-eat items (e.g., sandwiches available in 90% of the stores) were readily available across all store types. Across food categories, we found that the larger stores had a greater variety and higher quality of produce, lean meats and dairy, and whole grains. In addition, small grocers with gas had slightly more availability of processed snack foods (e.g., chips, sugary drinks). Key informant interviews (N=10) emphasized the challenges that these communities faced in terms of healthy food access, such as the drain of the large regional supercenter and related economic challenges. Interviewees described that many of these communities have an aging and dwindling population, however, they also have an interest in supporting locally grown and healthier foods, but conveyed that this may be cost prohibitive for local families. The need for community-driven solutions and for further engaging and tailoring nutrition and health education for rural and remote communities was also highlighted.

Conclusions: This study provides insights into how the rural food environment may shape dietary behaviors and inform healthy food access strategies, but also describes the development of methodology and tools relevant for the unique challenges that rural communities face.

MERITORIOUS AWARD WINNER

SMARTPHONE-BASED ASSESSMENT OF FOOD ENVIRONMENT ASSOCIATIONS WITH SUGAR-SWEETENED BEVERAGE (SSB) INTAKE IN SHANGHAI, CHINA

Jenna Hua, RD, MPH, PhD[1], Lindsey Smith, PhD[2], Victor Shia, PhD[3], Shufa Du, PhD[2], Jiajie Zang, MD, PhD[4], Edmund Seto, PhD[5]

[1]Stanford Prevention Research Center, Stanford, CA; [2]University of North Carolina, Chapel Hill, Chapel Hill, NC; [3]UC Berkeley, Berkeley, CA; [4]Shanghai Municipal Center for Disease Control and Prevention, Shanghai, Shanghai, China (People's Republic); [5]University of Washington, Seattle, WA

The rising obesity epidemic in China occurs at a time of fast economic development and built environment changes is characterized by increasing availabilities of energy-dense foods with added sugars, such as sugar-sweetened beverages (SSBs). As few studies have systematically quantified and addressed the nutrition transition and changes in the built environment in China, and how these shifts relate to changes in food environment, diet, physical activity and obesity, the objective of this paper is to use smartphone-assisted diet and physical activity assessments and mobility tracking to examine the relationships between food environment exposures and SSB consumption in rural and urban Shanghai.

120 healthy adults aged 25-40 years with roughly 1:1 rural to urban and male to female ratios. Participants’ SSB consumptions were assessed using smartphone-assisted 24-hour recalls on three consecutive days, and physical activities were assessed via a custom app called CalFit, which recorded date, time, latitude, longitude, and accelerometry counts at 10-second intervals. Participants’ food environment exposures were assessed by extracting food environment data along participants’ GPS tracks using a “Staypoint” algorithm and Google Places, and three measures were generated including overall number of food establishments, richness and Shannon Diversity Index. Other covariates were obtained via demographic surveys and anthropometric measurements. Logistic regression models were used in examining the relationships between food environment and SSB consumption. Multiplicative interactions between food environment exposure variables and the several covariates (age, sex, urbanicity, BMI, smoking, employment and parent status) were also explored in separate models.

23% of participants were overweight or obese; 33% were smokers; 44% had children, 54% had college or university degrees, and 52% reported SSB consumption. In general, participants had approximately 1814 Kcal of physical activities. They were exposed to 186 food establishments per day, and had an average richness score of 14.5 and Shannon Diversity Index of 2.86. Individuals' food environment exposures were found to influence their consumption of SSBs. Urban, older (aged 27-40), more educated, male gender and overweight participants had higher odds of consuming SSBs. Moderation effects were observed depending on participants' weight status, as well as in participants who have children versus without children.

As this is the first and only study utilizing smartphones to assess the associations between food environment and SSB consumption, more research is needed to replicate current study findings. Due to the sample size and cross-sectional nature of the current study, future longitudinal study with larger sample size would improve current study results.

Paper Session 15: Food Access and Availability 3:37 PM-3:54 PM

ECONOMIC FACTORS ASSOCIATED WITH DIETARY QUALITY AND MEETING DIETARY GUIDELINES IN UNDERSERVED NEIGHBORHOODS IN THE SOUTHEAST

Sara Wilcox, PhD, Patricia A. Sharpe, PhD, MPH, Angela D. Liese, PhD, MPH, Brent Hutto, MSPH

University of South Carolina, Columbia, SC

Background: Geography and economics can influence availability of healthy food, but it is unclear how these factors influence dietary intake in underserved, financially disadvantaged neighborhoods. This study examined whether dietary quality and the proportion meeting dietary guidelines differed by food security, education, and SNAP benefits in a predominantly African American sample from underserved neighborhoods..

Methods: Participants were recruited from seven census tracts in two South Carolina cities. Six met the USDA definition of an urban food desert. In-person interviews collected sociodemographic and food security information (using the 18-item USDA Household Food Security questionnaire). One unannounced 24-hour dietary recall was conducted by telephone using Minnesota's NDSR protocols and software. Healthy Eating Index 2010 (HEI-2010) total scores characterized dietary quality and conformance with federal dietary guidelines. Participants were also classified as meeting vs. not meeting 2010 Dietary Guidelines for major foods and macronutrients. Differences in mean dietary quality and percent meeting dietary guidelines according to food security (low/very low or high/marginal), education (less than high school, high school, or some college or greater), and receipt of SNAP benefits (yes or no) were tested with Fisher's exact test and ANOVA.

Results: Participants with dietary data (n=465) averaged 52.3±14.2 years; 92% were African American, 79% overweight or obese, 37% high school graduates, 32% at least some college, and 64% received SNAP benefits. HEI-2010 scores averaged 48.8±13.08 (max possible score=100). Fewer than 50% of the sample met dietary guidelines for total fat, saturated fat, carbohydrates, and grains. Fewer than 20% met guidelines for fiber, fruits, vegetables, transfat, and 50% whole grains. Dietary quality was lower among those in SNAP households (p=.06), those reporting high school or less education (p=.05), and among those in food insecure households (p=.04). Fewer food insecure participants met guidelines for 50% of grains being whole grains (8% vs. 15%, p=.03), but no other significant ($p < .05$) differences were found for meeting dietary guidelines by food security, those in SNAP households, or education.

Conclusion: Within southeastern underserved neighborhoods, economic variables were related to dietary quality but not meeting dietary guidelines. The lack of association with meeting dietary guidelines might be attributed to low percentages meeting guidelines overall.

Paper Session 15: Food Access and Availability 3:55 PM-4:12 PM

IS THERE A ROLE FOR SMALL FOOD RETAIL OUTLETS IN HEALTHY FOOD ACCESS?

Courtney Pinard, PhD, Leah Carpenter, MPH, Hollyanne Fricke, MPH, Teresa Smith, PhD, Amy Yaroch, PhD

Gretchen Swanson Center for Nutrition, Omaha, NE

Introduction: One contributing factor to poor diet is an environment in which foods high in sugar and fats are ubiquitous, coupled with a lower availability of more nutritious foods such as fruits and vegetables. This study explored the role that smaller food retail outlets (e.g., corner stores) can play in healthy food access.

Methods: Qualitative interviews were guided by the Social Ecological Model and were conducted with experts in the area of nutrition and public health (N=18) as well as with store-owners at small food retail outlets (N=20) on current practices, challenges, and strategies implemented. Interviews with content experts from across the United States (U.S.) were conducted by phone, while store-owner interviews were conducted in-person across the state of Nebraska. Interviews were recorded and transcribed verbatim, then coded for themes.

Results: Rural storeowners reported key challenges, including a dwindling population and competition with larger chains in neighboring towns set in a sparsely populated landscape. Urban storeowners reported challenges, including gang presence and safety concerns in their communities, which deterred even local customers. Both urban and rural storeowners described the constraints that manufacturer/distributor agreements place on their businesses. Content experts described the focus of their work and unique settings in which they implement interventions. Further, experts conveyed the opportunity small stores provide to address food access concerns in low resource communities, specifically to “meet consumers where they are.” Measurement gaps included difficulty in gaining access to and working with sales data, limited sensitivity of observation tools (e.g., NEMS), inadequate validity of secondary data and need for resource intensive primary data collection, and lack of understanding of shopping behaviors.

Conclusions: This study adds to the growing body of literature about the role that small food retail outlets can play in healthy food access, in particular the challenges and barriers that must be addressed. The triangulation of qualitative data from store-owners in Nebraska and content experts from across the U.S. provides a rich source of information to inform discussion of best practices and future directions.

Paper Session 15: Food Access and Availability 4:13 PM-4:30 PM

DOES THE ADOPTION OF THE HEALTHY EATING STANDARDS IMPACT SNACK QUALITY IN LOCAL AFTER-SCHOOL PROGRAMS?

Meagan Helmick, CHES, MPH[1], Abigail Esmond, MS[2], Valisa Hedrick, PhD, RD[3], Jamie Zoellner, PhD, RD[3], Wen You, Ph.D.[4], Jennie L. Hill, PhD[5]

[1]UNMC, Galax, VA; [2]Virginia Tech, Middleburg, VA; [3]Virginia Tech, Blacksburg, VA; [4]Virginia TEch, Blacksburg, VA; [5]University of Nebraska Medical Center, Omaha, NE

Background. More than 8 million children participate in after-school programs (ASPs). In 2011, the National Afterschool Association adopted the evidence-based Healthy Eating and Physical Activity Quality Standards (HEPAQS) to address snack quality & physical activity in ASPs. Although research has indicated promise in the adoption of these policies, little is known about local adoption, implementation, and effectiveness of HEPAQS. This study occurs under an ongoing CBPR initiative, as such, community partners responsible for local ASPs approached researchers to evaluate the planned adoption of HEPAQS in local ASPs. This allowed the partnership to take advantage of a natural experiment to 1) compare the quality of snacks served at ASPs sites before & after the HEPAQS policies were implemented, 2) determine the nutrient quality of snacks being offered, and 3) the impact of non-program snacks brought in by children or purchased at onsite vending machines. Methods. An interrupted time series design was used to measure children's snack observations across all sites during a pre-policy adoption period (n=531) & a post-policy adoption period (n=412) and included 3 policy adopting sites and 2 non-policy adopting sites as comparison control. Trained research staff collected snack type, brand, and amount consumed using the HAAND tool and a modified quarter-waste method. Analysis on nutrient content was completed in NDS-R software. Results. Adoption of the HEPAQS among the policy-adoption sites did not result in better snack quality based on adherence to the standards. Policy-adoption sites were only meeting 4 of the 9 adopted Healthy Eating standards post-policy, almost all of which were already being met pre-policy. Although no significant changes were expected among comparison sites, there was a significant increase in 100% fruit juice consumption and a decrease in grams of trans-fat from pre- to post-policy data collection. Across all 5 sites, program snacks were generally healthier than non-program snacks, as program snacks contained less SSBs, sweets, and snack chips. Conclusions. The adoption of the HEPAQS did not result in better snack quality thus pursuing additional HEPAQS of implementation, staff training, and social and program support may be necessary to impact snack quality. ASPs may improve non-program snack quality by addressing HEPAQS provided for ASPs or onsite vending machines and guidelines provided to parents regarding non-program snacks.

HARNESSING COMMUNITY-ENGAGED CITIZEN SCIENCE TO PROMOTE SAFE ROUTES TO SCHOOL IN RURAL PARTS OF SANTA CLARA COUNTY, CA

Nicole M. Rodriguez, MS [1], Sandra Jane. Winter, PhD, MHA[2], Bonnie Broderick, RD, MPH[3], Alisa Arce, MPH[4], Abby C. King, PhD[1], Ann Banchoff, MSW, MPH[1]

[1]Stanford School of Medicine, Palo Alto, CA; [2]Stanford University School of Medicine, Palo Alto, CA; [3]Santa Clara County, San Jose, CA; [4]Santa Clara County Public Health Department, San Jose, CA

Background: Community-engaged citizen science can promote sustainable local change to address health disparities and improve population health. By leveraging multi-sectoral partnerships, this cost-efficient model builds capacity for tailored behavioral health interventions. Through a partnership between Stanford School of Medicine and the Santa Clara County Public Health Department (SCCPHD), citizen science has been incorporated into local Safe Routes to School (SRTS) programs. This community-engaged process has been employed to unite residents, public and private organizations, non-government agencies, and researchers in driving the sustainable development of healthier communities. Methods: Stanford researchers partnered with the SCCPHD and relevant local organizations to develop a citizen science-engaged SRTS program in two rural schools in Gilroy, CA. The project involved 15 students at a middle school and 7 parents at an elementary school. Participants gathered qualitative information about neighborhood barriers and facilitators to health and wellbeing using an electronic tablet. Collectively, participants and partners prioritized neighborhood issues to address, possible solutions and potential allies. Results: Projects resulted in increased involvement of community residents in community health advocacy. Measurable effects include 6 school parent task force meetings, 5 monthly walking Wednesdays, 9 walking/biking encouragement events, 2 meetings with local stakeholders, and 4 community discussion meetings. In contrast, a neighboring school that did not involve the citizen science process in their SRTS program resulted in less overall community involvement without task forces and community discussion meetings, as well as fewer engagement events, with 2 walking/biking events and 2 walking school bus days. Conclusion: Incorporating citizen science into school-based public health investigations has helped launch community-based programs, task forces, and resident initiatives to improve walkability and bikeability in school settings. Citizen science has been shown to be an effective strategy for translating research into practice through advocacy and policy.

Learning objectives: Design projects that incorporate citizen science into school-based public health interventions. Develop effective community engagement strategies to involve community residents in health advocacy.

RESULTS OF A COMMUNITY-BASED APPROACH TO DECREASE GENDER-BASED PHYSICAL ACTIVITY DISPARITIES

April Ennis Keippel, MA[1], Nicholas Coombs, MS[2], Amanda L. Golbeck, PhD[3]

[1]St. Vincent Healthcare, Billings, MT; [2]Billings Clinic, Billings, MT; [3]University of Arkansas for Medical Sciences, Little Rock, AR

The Healthy By Design Coalition sought to accommodate gender norms to increase leisure-time physical activity for women and girls in Yellowstone County, Montana. Baseline data from the 2010/2011 Community Health Needs Assessment (CHNA) indicated a statistically significant disparity with 27.2% of women versus 17.2% of men reporting no leisure-time physical activity in the past month. To address this disparity, the Coalition developed a community-based approach including community-based participatory research, social marketing, and policy development.

A gender-tailored intervention with quasi-experimental cluster-randomized intervention trial was conducted. Groups were randomized to receive the standard, evidence-based Active Living Every Day program, a 12-week lifestyle approach class designed to increase physical activity in previously sedentary healthy adults, or the Gender-Tailored Active Living Every Day class, the standard class with additional focus on the role gender plays on physical activity, including specific strategies to overcome gender-based barriers to physical activity.

A social marketing campaign was developed to focus on gender-based activities in which women engaged, but did not consider physical activity. The campaign theme, “It all adds up” was designed to focus on accumulated activity. By accommodating existing gender-based caregiving roles and activities, physical activity could be accumulated without challenging existing societal expectations for women as caregivers.

Understanding gender was also influential in the development of worksite physical activity policies. Barriers to activity such as appearance expectations and discomfort sweating in front of others were taken into account as policies were drafted. The workplace physical activity policies emphasized incorporating short 5-10 minute physical activity breaks into meetings such as stretch breaks, icebreakers or other activities which would not require heavy sweating or special clothing.

In the fall of 2016, a follow-up survey was conducted using the same methodology as the 2010/2011 CHNA. Results from the 2016/2017 CHNA reveal a significant decrease in gender-

based physical activity disparities with only 19.8% of women and 15.04% of men reporting no leisure-time physical activity as compared to 27.2% of women and 17.2% of men in 2011. These results indicate a collaborative community-based approach may lead to a decrease in gender-based physical activity disparities.

CULTURALLY-RELEVANT ONLINE EDUCATION EMPOWERS COMMUNITY HEALTH WORKERS TO REDUCE CANCER RISK AND DISSEMINATE INFORMATION

Katie Cueva, MAT MPH[1], Melany Cueva, RN, EdD[2], Laura Revels, BA[3], Anne Lanier, MD, MPH[2], Mark Dignan, PhD, MPH[4]

[1]University of Alaska Anchorage, Anchorage, AK; [2]Alaska Native Tribal Health Consortium, Anchorage, AK; [3]ANTHC, Anchorage, AK; [4]University of Kentucky, Lexington, KY

INTRODUCTION

Alaska’s community-based primary care providers requested information about cancer for themselves and their communities that would overcome geographic and economic barriers by being accessible via the Internet. In response, a research team at the Alaska Native Tribal Health Consortium developed a successful application to the National Cancer Institute to create a culturally-respectful distance-delivered cancer education course with, and for, Alaska’s Community Health Aides and Community Health Practitioners (CHA/Ps).

THEORETICAL FRAMEWORK

This intervention is framed by Community-Based Participatory Action Research that honors Indigenous Ways of Knowing, and is grounded in Empowerment Theory. Empowerment Theory includes three components of empowerment outcomes: intrapersonal (a change in the way an individual thinks of themself), interactional (shifts in understanding about a given concern), and behavioral (actions taken to directly influence outcomes).

APPROACH

Nine interactive online cancer education modules were created on topics including Women’s Health, Colorectal Cancer, Men's Health, Cancer and Our Genes, Tobacco, and Cancer Basics. Each of these modules was reviewed by content experts and a community advisory board of CHA/Ps and partners. The revised versions were published online through the Alaska Community Health Aide Program Training Center as CHA/P continuing education. While evaluation is iterative and ongoing, 338 module evaluations were collected between March 2015 and July 2016.

RESULTS

Similar to employed CHA/P demographics, individuals who provided evaluations were mostly female (85%) and Alaska Native/American Indian (76%). Evaluation measured the three components of Empowerment Theory; changes in comfort and confidence in talking about cancer (intrapersonal), changes in knowledge (interactional), and intent to disseminate cancer information and reduce cancer risk (behavioral). Preliminary findings include respondents sharing they would use the information they learned in the cancer education modules with their patients (85%) and their communities (61%); and that most respondents (80%) reported the cancer education modules had made a difference in the ways they took care of themselves, including motivating CHA/Ps to reduce or quit tobacco use, eat healthier, exercise more, and schedule cancer screening exams.

DISCUSSION

CHA/Ps, and other community health workers, are optimal people to empower individual and community-level behavior change due to their embeddedness within existing social networks, and their centrality in each community's health network. The impact of interventions with community health workers can change actual, or perceived, social norms, and disseminates those norms through social networks to promote community-wide health behavior change.

Paper Session 16: Leveraging Communities to Advance Health Promotion 3:55 PM-4:12 PM

IT'S TIME TO ACT: ASSESSING STUDY DESIGN OF A HEALTH PROMOTION PILOT INTERVENTION TO IMPACT CRC SCREENING AMONG AFRICAN AMERICANS

Crystal Y. Lumpkins, PhD, MA[1], Adam G. Blackstock, Doctorate of Divinity[2], W. Todd Moore, MPS[1], Christina Hester, PhD, MPH[1], Rayven Smart, Masters of Science in Marriage and Family Therapy [1], Jannette Berkley-Patton, PhD[3], Christine M. Daley, PhD, MA, SM[1]

[1]University of Kansas Medical Center, Kansas City, KS; [2]Glory Bible Fellowship International Church, Lees Summit, MO; [3]University of Missouri-Kansas City, Kansas City, MS

Background: Colorectal cancer (CRC) incidence and morbidity disparities among African Americans may be addressed through innovative health communication and health promotion programs co-designed and co-delivered by the community. This study details the feasibility of design, intervention and baseline characteristics of a Community-Based Participatory Research (CBPR) faith-based pilot intervention to increase CRC screening among African Americans. **Method**: A cluster randomized design was employed to assign 4 churches to an intervention group where they received tailored materials through a socially marketed communications campaign within the church (“*It’s Time to ACT*”) and 4 churches to a control group (non-tailored and non-socially marketed). Church members and community members who were 45 years or older; not up-to-date with screening and who did not have a family history of CRC were recruited for the study. All 8 churches were within a bi-state area in the Midwest and were predominately African American congregations. Participant baseline characteristics were measured to assess attitude toward screening, attitude toward the tailored CRC screening communication materials within the campaign, attitude toward the church co-sponsoring the tailored materials, CRC beliefs and also behavior intention. Primary outcome was screening completion of an iFOBT (immunochemical fecal occult blood test). **Results**: Church members and also community members affiliated with the study churches were enrolled (N=175). At baseline 77% of the intervention group participants indicated that they had intentions to complete CRC screening with an iFOBT. Based on 7-point semantic scales, a majority of this group had a positive attitude toward their church as the co-sponsor of a tailored CRC post card advertisement and rated it as credible (M=1.3). More than half of the participants in the intervention (78%) and comparison groups (83%) also had a positive attitude toward screening for CRC with a fecal occult blood test. **Conclusions**: Preliminary results of baseline data show that church members recruited to participate in a CPBR health communication pilot-intervention study focused on increasing CRC screening behavior among African Americans is feasible. Employing faith-based organizations to co-develop and co-

deliver health communications programs within faith-based settings aimed at improving CRC screening shows promise.

INTEGRATING CIVIC ENGAGEMENT INTO A BEHAVIOR CHANGE INTERVENTION TO REDUCE CARDIOVASCULAR DISEASE IN RURAL WOMEN

Rebecca Seguin, PhD, CSCS, Urshila Sriram, MSPH, Meredith Graham, MS

Cornell University, Ithaca, NY

Introduction: Rural women experience poorer health outcomes as compared to their urban counterparts. These disparities are partly attributable to environmental conditions, including limited access to healthy foods, opportunities for physical activity, and medical care. Civic engagement is a potential strategy for improving community environments; however, research on the effectiveness of this approach in rural contexts is limited. The present study aimed to evaluate the implementation of a novel civic engagement curriculum (HEART Club) designed to catalyze positive environmental change in rural communities.

Methods: The HEART Club curriculum was integrated into a six-month community-based lifestyle modification intervention trial to reduce heart disease risk factors among overweight/obese rural women in medically underserved communities. HEART Clubs were implemented with the support of the local health educators running the intervention program in eight rural towns in Montana and New York. At each site, participants worked to collectively address an issue related to their local food or physical activity environment and establish benchmarks for self-monitoring of progress.To assess HEART Club progress, focus groups (n=8) and interviews (n=8) were conducted with participants and leaders post-intervention. Leaders also completed an online evaluation survey three months post-intervention.

Results: The majority of HEART Club groups in the eight towns documented satisfactory progress and had accomplished two or more benchmarks post-intervention. Among the most successful groups, facilitators of progress included support from local stakeholders, effective leadership, and high group morale. Resource constraints, uncertain expectations, and unfeasible timelines were cited as barriers to HEART Club implementation. Results also indicate that participants felt overwhelmed by the prospect of community change while simultaneously trying to make personal health improvements and their initial resistance likely stalled progress.

Conclusions: These findings highlight both the potential and challenges associated with rural civic engagement initiatives within the context of a lifestyle intervention program among at risk, underserved women. Findings can help guide improvements to ensure future success of this approach.

ASSESSING DEPRESSION IN MILITARY MENTAL HEALTH: A COMPARISON OF THE PHQ-9 AND PHQ-8

Jagruti Bhakta, PhD[1], Vasudha Ram, MPH[2], Scott Roesch, Ph.D[3], Jennifer Webb-Murphy, PhD[2], Jeffrey Millegan, MD, MPH[2], Scott Johnston, CAPT, PhD[2]

[1]Naval Center for Combat & Operational Stress Control (NCCOSC), San Diego, CA; [2]Naval Center for Combat & Operational Stress Control, San Diego, CA; [3]San Diego State University, San Diego, CA

The World Health Organization (WHO) recognizes depression as a global public health concern (WHO, 2012) and one of the most burdensome diseases in the world (WHO, 2002). It is one of the leading causes of disability and reduced work productivity. Due to the high prevalence and impact of this disease, valid scales for the screening and diagnosis of depression are essential in healthcare. The Patient Health Questionnaire nine item (PHQ-9) scale is commonly used to assess depression and is valid as both a diagnostic and severity measure. However, the ninth item of the scale, which asks about suicide, has caused some concerns. Specifically, there is sometimes apprehension to ask this question in a self-report fashion without immediate opportunity to assess any positive endorsement. In the military population where increased attention is being placed on suicide, institutional review boards are especially critical of the ninth item (Wells, Horton, LeardMann, Jacobson & Boyko, 2013). Some studies have adopted the PHQ-8, which excludes the ninth item and found it to be valid for assessing depression in general (Kroenke, Strine, Spitzer, Williams, Berry & Mokdad, 2009) and military (Wells et al., 2013) populations. The depression screening capabilities of the PHQ-8 versus PHQ-9 have yet to be examined in a military mental health population.

In order to compare the PHQ-8 with the PHQ-9 and understand their ability to screen for depression we conducted a retrospective analysis of self-report data from 2854 active-duty service members (SMs) who completed the PHQ-9 as part of a standardized assessment program, Psychological Health Pathways (PHP), in military mental health clinics from 2009 to 2012. Univariate analyses determined how often SMs screened positive or negative on both measures, and how often they screened positive on PHQ-9 but negative on PHQ-8. Kappa statistics at T1 (entry into PHP) and T2 (10 weeks post-PHP entry) established the degree of non-random agreement and provided a cross-sectional comparison of performance at both time points. Kappa statistics also determined level of agreement between PHQ-8 and PHQ-9 to detect clinically significant improvement (a 5-point or greater decrease in score from T1 to T2). Only 49 (1.7%) of the 2854 SMs screened discordantly (PHQ-9 positive and PHQ-8 negative) when using the PHQ-8 compared with the PHQ-9. At baseline, 1524 (53.4%) SMs screened positive for depression on the PHQ-9, and of those, 1475 (96.8%) screened positive

using the PHQ-8. The PHQ-8 had greater than substantial agreement with the PHQ-9 (k=.97), and it also compared well when assessing a 5-point or greater increase (k=.91) or decrease (k=.95) in score from T1 to T2. Our results indicate that the PHQ-8 performs similarly to the PHQ-9 when assessing depression in military mental health.

VETERANS GROUP EXERCISE: INTEGRATING EXERCISE AND MINDFULNESS TO REDUCE POST-TRAUMATIC STRESS

Lizabeth Goldstein, PhD[1], Wolf Mehling, MD[2], Margaret A. Chesney, PhD[3], Thomas J. Metzler, N/A[4], Shira Maguen, PhD[5], Chris Geronimo, CTRS[6], Gary Agcaoili, BA / CTRS / RTC[7], Jennifer Hlavin, MS[8], Thomas C. Neylan, MD[9]

[1]San Francisco VA Medical Center, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA; [3]UCSF School of Medicine, Menlo Park, CA; [4]San Francisco VA Health Care System, San Francisco, CA; [5]San Francisco VA Medical Center and UCSF, San Francisco, CA; [6]SFVAHCS, Belmont, CA; [7]VHA VA Northern California Health Care System, Martinez, CA; [8]San Francico VA Medical Center, San Francisco, CA; [9]University of California, San Francisco, San Francisco, CA

Posttraumatic stress disorder (PTSD) is prevalent among military veterans (Ramchand et al., 2010; Schlenger et al., 1992) and is associated with a number of negative physical health outcomes, including cardiovascular disease (Ahmadi et al., 2001) and obesity (Bartoli et al., 2015). Although empirically supported psychotherapies for PTSD have been disseminated in the Veterans Health Administration (Karlin et al., 2010), only about 10% of veterans attend a minimally adequate number of mental health appointments in the first year following PTSD diagnosis (Seal et al., 2010). Veterans with mental health disorders endorse significant barriers to traditional mental health treatment, including stigma (Hoge et al., 2004), necessitating the development of alternative treatment options for PTSD. We developed an integrative exercise (IE) program combining aerobic and resistance exercise, which is familiar to veterans, with mindfulness-based practices, which are increasingly utilized in military programs (Crawford et al., 2013). Veterans (*N* = 47) were randomized to either IE or waitlist control (WL). The sample was 81% male and 47% racial/ethnic minority. Average duration of PTSD was 18 years, and 40% of participants were concurrently taking psychiatric medication. IE was offered in group format at a local YMCA for 3 1-hour sessions weekly for 12 weeks. Exercise sessions emphasized aerobic exercise, strength training (weights and resistance bands), and yoga within the context of mindfulness-based principles, such as nonjudgmental attitude and acceptance. Seventy-six percent of veterans randomized to IE completed the program and demonstrated an average reduction of 31 points on the Clinician Administered PTSD Scale, significantly greater than WL (*M* = 15), *d* = .90, *p* = .038. In particular, symptoms of hyperarousal improved substantially more in the IE group compared with WL, *d* = .80, *p* = .044. There was also greater improvement in quality of life in the psychological domain, (*d* =

.53, $p = .005$) but no relative improvement in quality of life in the physical domain ($d = .33$, $p = .183$), both as measured by the World Health Organization Quality of Life (WHOQOL-BREF) subscales. This initial study suggests that IE is a novel approach to treating veterans with PTSD that reduces symptoms of posttraumatic stress and improves psychological quality of life. This approach to recovery may expand the reach of PTSD treatment into less-stigmatized activities and settings.

Paper Session 17: Mental and Physical Health of Veterans 3:55 PM-4:12 PM

FIVE-YEAR DIABETES COMPLICATION PROGRESSION LESS SEVERE IN VETERANS WITH MENTAL HEALTH CONDITIONS

Eric Schmidt, PhD[1], Cheng Chen, MS[2], James Barnes, MD, MS[3], Jessie Wong, PhD[2], Alex Harris, PhD[4]

[1]HSR&D, VA Palo Alto Health Care System, Menlo Park, CA; [2]VA Palo Alto Health Care System, Menlo Park, CA; [3]Stanford University, Stanford, CA; [4]VA Palo Alto HCS, Palo Alto, CA

Mental health conditions (MHCs) are associated with higher risk for diabetes complications, but their association with progression of diabetes complications over time is understudied. Administrative data from the Veterans Health Administration (VHA) was used to identify patients with new-onset diabetes in 2008 who were alive through 2013. Patients were included (N = 91,687) if aged 18-75 years at the time of their first recorded diabetes diagnosis, and if they used any VHA medical care in 2013. The Diabetes Complication Severity Index (DCSI, score range 0-13) was calculated for two periods of time: (1) two years before diabetes onset (“baseline”), and (2) the one-year period starting five years after the date of the patient’s first diabetes diagnosis. Change in DCSI score from baseline to five years after diabetes onset was regressed on baseline socio-demographics, comorbidities, and medical and mental health care utilization. Having or not having a MHC at baseline was the main comparison of interest. On average, DCSI scores increased by 0.63 (SD = 1.49) after five years. Patients with MHCs at baseline (27.3%) were 2.8 years younger, more likely to be female, unmarried, homeless, and had more medical comorbidities ($p < .001$ for all). Patients with MHCs had higher DCSI scores at baseline (mean = 0.76, SD = 1.18) but lower scores five years later (mean = 1.00, SD = 1.34) than did patients without MHCs (means = 0.37 and 1.15, SDs = 0.88 and 1.48, respectively). Contrary to our hypotheses, having a MHC was independently associated with less progression of diabetes complications ($b = -.39$, $SE = .02$, $p < .001$) after controlling for baseline socio-demographics, comorbidities, and health care utilization. More outpatient visits to a mental health provider before a patient’s first diabetes diagnosis was further associated with less of an increase in DCSI score after five years ($b = -.005$ per visit, $SE = .001$, $p < .001$). Unique aspects of VHA health care delivered to people with MHCs may be protective against diabetes complications, compared to care delivered to people without MHCs. Future studies should use longitudinal designs with greater power to model moderators and mediators of diabetes progression while investigating unique aspects of care received by Veterans with MHCs and diabetes.

Paper Session 17: Mental and Physical Health of Veterans 4:13 PM-4:30 PM

PERSISTENT POSTTRAUMATIC STRESS DISORDER AMONG U.S. MILITARY SERVICE MEMBERS AND VETERANS

Richard F. Armenta, Epidemiologist[1], Toni Rush, MPH[2], Cynthia A. LeardMann, MPH[3], Jeffrey Millegan, MD, MPH[4], Adam Cooper, CPT/PhD[5], Charles W. Hoge, MD[6]

[1]Naval Health Research Center/Henry Jackson Foundation, San Diego, CA; [2]UCSD/SDSU Joint Doctotal Program in Epidemiology, Oak Harbor, WA; [3]Naval Health Research Center, San Diego, CA; [4]Naval Center for Combat & Operational Stress Control, San Diego, CA; [5]Naval health Research Center, San Diego, CA; [6]Walter Reed Army Insitute of Research, Silver Spring, MD

Objective: Chronic posttraumatic stress disorder (PTSD) can have long-term and far-reaching impacts on health, social, and occupational functioning. This study examined factors associated with persistent PTSD among U.S. service members and veterans.

Method: Using baseline and follow-up (2001–2013) questionnaire data from the Millennium Cohort Study, multivariable logistic regression was used to determine factors associated with persistent PTSD. Participants included those who screened positive for PTSD using the PTSD Checklist–Civilian Version at baseline (*n*=2409). Participants were classified as having remitted or persistent PTSD based on screening negative or positive, respectively, at follow-up.

Results: Almost half of the participants (47%) met criteria for persistent PTSD at the first follow-up; among those, 71% also screened positive for PTSD at the second follow-up. Multiple factors were independently associated with persistent PTSD in an adjusted model at the first follow-up, including older age, deployment with high-combat exposure, enlisted rank, initial PTSD severity, depression, history of physical assault, disabling injury/illness, and somatic symptoms. Among those with persistent PTSD at the first follow-up, additional factors of less sleep, separation from the military, and lack of social support were associated with persistent PTSD at the second follow-up.

Conclusions: Combat experiences and PTSD severity were the most salient risk factors for persistent PTSD. Comorbid conditions, including injury/illness, somatic symptoms, and sleep problems, also played a significant role and should be addressed during treatment. The high percentage of participants with persistent PTSD supports the need for more comprehensive and accessible treatment, especially after separation from the military.

CITATION AWARD WINNER

PERCEIVED WEIGHT, RACIAL, AND SEX DISCRIMINATION AND CARDIOVASCULAR DISEASE IN UNITED STATES ADULTS

Carlos M. Grilo, PhD[1], Tomoko Udo, PhD[2]

[1]Yale University School of Medicine, New Haven, CT; [2]SUNY Albany, Albany, NY

Objective: Psychosocial stress has received increased attention as a potential modifiable risk factor for cardiovascular disease (CVD). Perceived discrimination is increasingly recognized as a psychosocial stressor with a profound impact on physical and mental health. To date, much of the research on discrimination in relation to CVD has focused on racial discrimination. The current study investigated the relationship between three common forms of discrimination (weight, race, and gender) and 3-year incidence of CVD in a large national sample of U.S. adults.

Methods: 26,992 adults (55.5% women) who participated in the 2001-2002 and 2004-2005 National Epidemiologic Survey of Alcohol and Related Conditions (NESARC) were included in this study. Multiple logistic regression analyses were used to calculate odds ratios (OR) and 95% confidence intervals (CI) for three forms of perceived discrimination (simultaneously included in equations after adjusting for relevant confounds) for predicting CVD incidence at Wave 2.

Results: Adjusting for sociodemographic variables and other confounders, perceived weight and racial discriminations were associated with significantly greater likelihood of reporting myocardial infarction (OR=2.56 [95% CI=1.31-4.98], OR=1.84 [95% CI=1.19-2.84], respectively) and minor heart conditions (OR=1.48 [95% CI=1.11-1.98], OR=1.41 [95% CI=1.18-1.70], respectively). Perceived racial discrimination was also significantly associated with greater likelihood of reporting arteriosclerosis (OR=1.61 [95% CI=1.11-2.34]). Odds of diagnoses for arteriosclerosis, myocardial infarction, and other minor heart disease were the largest for individuals reporting multiple forms of discrimination.

Conclusion: Our findings suggest that adults who experience weight and racial discrimination, and especially multiple forms of discrimination, may be at heightened risk for CVD. Our findings add to the emerging literature on the detrimental effects of obesity stigma. Perceived discrimination may be important to consider during assessment of life stressors by health providers. Future research should address mechanisms linking discrimination and CVD and

especially on public health and policy efforts to reduce discrimination which may contribute to improved health outcomes.

MINORITY STRESS, PSYCHOSOCIAL RESOURCES, AND PSYCHOLOGICAL DISTRESS AMONG SEXUAL MINORITY BREAST CANCER SURVIVORS

Charles Kamen, PhD, MPH[1], Jennifer M. Jabson, PhD, MPH[2], Karen Mustian, PHD, MPH, MS[1], liz margolies, LCSW[3], Luke J. Peppone, PhD, MPH[4], Matthew Asare, PhD, MBA, CHES[5], Michelle Janelsins, PhD, MPH[1], Ulrike Boehmer, PhD[6]

[1]University of Rochester Medical Center, Rochester, NY; [2]University of Tennessee, Knoxville, TN; [3]National LGBT Cancer Network, New York, NY; [4]University of Rochester, Wilmot Cancer Institute, Rochester, NY; [5]University of Rochester, Rochester, NY; [6]Boston University School of Public Health, Boston, MA

Background: Few studies have examined unique factors associated with psychological distress among sexual minority (i.e., lesbian and bisexual) women following breast cancer diagnosis. The minority stress model posits that heterosexist discrimination increases distress in sexual minority persons, and that the effect of discrimination could be mediated by positive and negative psychological factors. The present study assessed the associations between minority stress, adaptive psychosocial resources, and distress (depression and anxiety) among sexual minority breast cancer survivors.

Methods: 201 sexual minority women who had ductal carcinoma in situ (DCIS) or stage I-IV breast cancer participated in this study through the Love/Avon Army of Women (AOW). Self-report questionnaires were used to assess demographic and clinical factors, depression, anxiety, minority stress factors (discrimination, minority identity development, outness), and psychosocial resources (resilience, social support). These factors were included in a structural equation model testing psychosocial resources as mediators between minority stress and psychological distress (a latent variable derived from depression/anxiety).

Results: Over half (50.2%) of women in the sample had experienced heterosexist discrimination; 15% reported elevated depression, and 29% reported elevated anxiety. Discrimination, negative minority identity, resilience, and social support were correlated with

depression and anxiety. While outness and negative minority identity remained positively associated and social support remained negatively associated with distress in the final structural equation model, resilience fully mediated the association between discrimination and psychological distress. The final model predicted 56% of the variance in the latent variable of psychological distress and demonstrated acceptable fit across all sexual minority women, $\chi2 = 24.50$, $p > 0.05$; confirmatory fit index = 0.99, root-mean-square error of approximation = 0.02.

Conclusions: Minority stress factors are associated with higher rates of psychological distress among sexual minority women who are breast cancer survivors, while psychosocial resources are associated with reduced distress. Exposure to discrimination is common in this population; however, development of resilience mediates the relationship between discrimination and distress. Enhancement of resilience could be a promising aim of interventions to improve psychological well-being among sexual minority cancer survivors.

Paper Session 18: Innovative Studies on Discrimination and Stress 3:37 PM-3:54 PM

RACIAL DISCRIMINATION & ALLOSTATIC LOAD AMONG AFRICAN AMERICAN WOMEN: ROUTINE VS. NON-ROUTINE EXPERIENCES OF DISCRIMINATION

Marilyn Thomas, MPH[1], Eli Michaels, BA[2], Alexis Reeves, MPH[2], Okoye Uche, BS[3], David Chae, ScD[4], Amani Nuru-Jeter, PhD[2]

[1]University of California Berkeley School of Public Health, Redwood City, CA; [2]University of California Berkeley School of Public Health, Berkeley, CA; [3]University of California Berkeley School of Public Health, Carson, CA; [4]Auburn University, Auburn, AL

Objective: To examine the association between racial discrimination and allostatic load (AL), an index of physiologic functioning across biological systems, among midlife African American women, and to assess potential variation in routine vs. non-routine experiences of discrimination.

Methods: Data are from the African American Women's Heart & Health Study, which recruited a community sample of 208 African American women ages 30-50 residing in the San Francisco Bay Area. The Experiences of Discrimination scale was used to measure non-routine racial discrimination (e.g., in housing, medical care, criminal justice contexts). Routine racial discrimination was assessed using the 10-item Everyday Discrimination Scale (e.g., being treated with less courtesy or respect due to race). AL was measured as a composite score consisting of 15 biomarkers representing cardiovascular, inflammatory, neuroendocrine, and metabolic function. Multivariate analyses were adjusted for socioeconomic indicators and other known confounders.

Results: Compared to those reporting very high levels of discrimination (reference), there was a significant positive association between non-routine racial discrimination (EOD) and AL among those reporting no experiences of discrimination (β=1.45, SE=.64, p

Conclusion: Findings raise methodological questions about how racial discrimination is conceptualized and measured. Results suggest that reporting non-routine, major life experiences of racial discrimination, is associated with AL but not in the expected direction. Conversely, routine everyday experiences show no effect. Being able to recognize and report racial discrimination in more major, domain-specific life situations may have self-protective properties. This may be the case particularly in light of the more ambiguous and subtle ways in which contemporary forms of racial discrimination manifest in institutional contexts. These results call attention to the need to understand how different types of racial discrimination impact health, and to revisit presumptive associations. Using stress theory, we discuss potential explanations for these findings and make recommendations for future direction in research.

THE PROTECTIVE ROLE OF MINDFULNESS IN THE RELATIONSHIP BETWEEN PERCEIVED DISCRIMINATION AND DEPRESSION

Amanda J. Shallcross, ND, MPH[1], Tanya Spruill, PhD[2]

[1]New York University School of Medicine, New York, NY; [2]NYU School of Medicine, New York, NY

Background: Perceived discrimination has substantial negative effects on well-being and is associated with severe psychological outcomes, including depression. Similar to other types of life stress, the consequences of discrimination may depend on an individual's ability to cope with negative emotions triggered by a distressing event. Widespread evidence indicates that mindfulness, deliberate attentiveness to internal and external experiences, is an effective coping strategy that is associated with salutary outcomes in the face of stressful experiences, including discrimination. Few studies, however, have examined the role of mindfulness in minority samples. Thus, it is unknown whether the protective effects of mindfulness extend to racial/ethnic minorities, who are most likely to experience discrimination.

Objective: The goal of the current analysis is to test whether trait mindfulness moderates the relationship between perceived discrimination and depressive symptoms in a minority sample.

Method: A heterogeneous sample of healthy adults (n=163) living in New York City were recruited as a part of a larger study on stress, rumination, and blood pressure. A subset (n=100) of exclusively minority participants (54% female; 48% Black/non-Hispanic, 35% Hispanic, 14% Asian, 3% mixed race/ethnicity; 34 years=Mean age) was used for the current analysis. Standardized inventories of trait mindfulness, perceived discrimination, and depressive symptoms were assessed cross-sectionally.

Results: Regression analyses indicated a significant interaction between perceived discrimination and trait mindfulness predicting depressive symptoms ($\beta = -1.3$, $p = .04$). Simple slopes analyses revealed that participants lower in mindfulness exhibited increased depressive symptoms with higher levels of discrimination ($\beta = 2.3$, $p < .001$). Discrimination

was not associated with increased depressive symptoms among individuals higher in mindfulness (β = -.05, *p* =.96).

***Conclusions**:* This study is one of the first empirical studies of trait mindfulness in an exclusively minority sample. Results suggest that mindfulness may mitigate the deleterious effects of discrimination on depressive symptoms in racial/ethnic minority individuals. The high prevalence and severity of discrimination among minorities, in particular, underscores the importance of these findings. The use of mindfulness-based interventions may be a promising approach to reduce the harmful psychological effects of discrimination.

SOCIO-ENVIRONMENTAL STRESS EXPOSURES AND OBESITY: RESULTS FROM THE HCHS/SOL SOCIOCULTURAL ANCILLARY STUDY

Adolfo Cuevas, PhD[1], Cheryl Clark, MD, ScD[2], Carmela Alcantara, PhD[3], Sheila F. Castaneda, PhD[4], Martha Daviglus, MD, PhD[5], Donglin Zeng, Samantha Reina, Mercedes Carnethon, Ph.D.[6], Linda C. Gallo, PhD[7], Carmen R. Isasi, MD, PhD[8], Robert Kaplan, William Arguelles

[1]Harvard T.H. Chan School of Public Health, Boston, MA; [2]Brigham and Women's Hospital, Boston, MA; [3]Columbia University, New York, NY; [4]San Diego State University, San Diego, CA; [5]University of Illinois at Chicago, Chicago, IL; [6]Northwestern University, Chicago, IL; [7]San Diego State University, Chula Vista, CA; [8]Albert Einstein College of Medicine, Bronx, NY

Introduction: Hispanics/Latinos have a higher rate of obesity compared to non-Hispanic Whites.[1,2] Few studies have examined the obesogenic effects of three socio-environmental stressors (ethnic discrimination, acculturative stress, neighborhood stress), and the combined effect of the individual stressors.

Methods: Data derived from the Sociocultural Ancillary Study, which assessed sociocultural and psychosocial influences in cardiovascular risks in a subset (n= 5,313) of the larger Hispanic Community Health Study/Study of Latinos. BMI was used to define weight categories as underweight/normal weight, overweight, and obese. The three socio-environmental stress variables were each standardized to facilitate comparison across stress domains. A cumulative stress variable was created by summing together each of the standardized socio-environmental stressors. Multinomial logistic regression was used to model the effects of each stressor, adjusting for sociodemographics, physical activity, and dietary behavior.

Results: Greater ethnic discrimination and greater acculturative stress were each associated with a higher odds of being obese (OR=1.14, 95% CI=1.01-1.29 and OR=1.17, 95% CI=1.04-1.31, respectively). Compared with no stress, those experiencing stress in a single domain had a 1.84 times higher odds of being obese (95%CI=0.73-4.61), while those experiencing stress in two or three domains had 1.94 (95%CI=0.78-4.83) and 2.29 (95%CI=0.94-5.61) times greater odds of being obese, respectively.

Conclusion: Ethnic discrimination and acculturative stress may be important contributors to obesity among Latinos/Hispanics. Stress management techniques may serve as complementary methods to lifestyle modification interventions to prevent or treat obesity in Hispanics/Latinos.

Paper Session 19: Substance Use: Patterns and Treatments 3:00 PM-3:18 PM

SUBSTANCE USE PATTERNS IN HOMELESS YOUTH: RESULTS OF AN ECOLOGICAL MOMENTARY ASSESSMENT

Diane Santa Maria, DrPH, MSN, RN, APHN-BC[1], Julia Joohyun. Jung, BA[2]

[1]University of Texas Health Science Center Houston, Houston, TX; [2]School of Social Sciences and Humanities, Houston, TX

Introduction: Homeless youth have high rates of substance use. While housing instability and homelessness has been associated with higher rates of risky behaviors such as substance use, there is limited literature assessing how substance use rates vary depending on day level housing type. Yet, most studies exploring this association have been limited to cross-sectional data.

To address this gap, we explored if the relation between shelter type and substance use using Ecological Momentary Assessment (EMA) data from homeless youth in Houston.

Methods: We recruited 71 homeless youth aged 18–24 from a drop-in center in Houston, TX, between September 2015 and March 2016. We conducted daily EMAs for up to 3 weeks, which measured substance use and shelter status. To determine the relation between substance use and shelter status, we conducted chi-squared testing on daily EMAs (n = 71, EMAs =2232).

Results: We collected a total of 861 daily assessments using EMA. Daily EMAs indicate that 221 (24.4%) were substance use days and 44 (5.1%) were alcohol use days. Days of substance use per participants ranged from 0-18 days out of 21 possible days. In response to the question regarding shelter status, youth most frequently reported unstable housing (i.e. staying with friends, acquaintances, or relatives) (44% of days), staying on the streets (15%), and in shelters (12%). Using chi-squared tests, we found a significant difference ($p > 0.00$) in daily substance use by current shelter status. Days in which youth stayed with a friend or acquaintance had the highest rates of substance use (35.6%) followed by street dwelling days (34.4%) and days staying in the home of a romantic or sexual partner (33.7%). Shelter days had the lowest rates of substance use (7.8%). We also found a significant difference ($p > 0.00$) in daily alcohol use by shelter status. Days when youth stayed in a car had the highest rates of alcohol use (11.11%) followed by days staying in a hotel or motel (10.7%) and on the streets (9.4%). Shelter days had the lowest rates of alcohol use (1.9%) followed by days staying with relatives (2.8%).

Conclusion: We found that shelter type is associated with higher rates of substance and alcohol use. This data suggests that sheltering type may reduce the risk of substance use and

that days when youth stay with others may be high risk substance use days. The social network surrounding unstable housing circumstances and substance use warrants further exploration.

Factors Contributing to Successful Induction in Medication Assisted Treatment

Emily Zhang, Naomi Newman, Emily Loscalzo, & Robert Sterling

Thomas Jefferson University

While ASAM's expert panel suggests that it should take 4-6 weeks to achieve an effective blocking dose for those in medication assisted treatment-MAT (Baxter et al., 2013), little research is available on latency to abstinence in this treatment population. To address the gap in the literature, this study examined latency to abstinence and possible predictors. Abstinence was defined as four consecutive negative urine tests. Subjects were a subsample of 132 consecutive admissions to a university sponsored, community based, outpatient, MAT facility. Participants were individuals admitted between 7/1/2014-6/30/2015. Average age at time of admission was 41.75 ±10.54; 72% were male; 68.9% were white. Mean age of first drug use was 23.52±8.15; mean years of opiate use were 18.3±11.62; mean number of prior drug treatment episodes was 3.37±2.88. For latency to secondary substance abstinence, only 20.7% of the 121 identified at admission as using a second drug were abstinent within one year, indicating that individuals struggled to suspend secondary drug use. A series of discriminant analyses were conducted to identify whether key demographic, life skill, addiction, social support, and mental health variables were predictive of latency to opioid abstinence. Analyses conducted on the entire sample failed to identify a set of predictor variables. Thus, two discreet groups were identified – those who achieved abstinence in accord with the ASAM criteria (n=24) and those unable to achieve abstinence in the first year of enrollment (n=24). A significant discriminant function (Wilks' Lambda = .50, p=.02), which correctly re-classified 79.2% of the initial cases, was identified. Examination of the discriminant function coefficients suggest that a younger, more educated, later heroin use onset, more resource laden individual with a sense of efficacy to achieve abstinence was less likely to obtain abstinence. These results differentiate between who engages in and profits more rapidly from treatments vs. who engages in bad outcomes. Data suggest that efforts to increase the likelihood of profiting from treatment should focus on issues related to age, education, financial resources, over-confidence, and opioid abuse history. Such individuals are at risk for continued illicit substance use despite MAT enrollment.

PERCEPTIONS AND BELIEFS MOTIVATING PARENTAL DISCUSSIONS OF MARIJUANA USE WITH CHILDREN

Tenie Khachikian, MSW, Linda D. Cameron, Ph. D.

University of California, Merced, Merced, CA

Adolescent marijuana use remains a significant issue in the United States. Recent legalization of marijuana use could lead parents to perceive marijuana use as less harmful and possibly decrease concerns of marijuana use by their children. Parents play an important role in adolescent substance use prevention and reduction, and their engagement in discussions of substance use with their children can significantly influence their experimentation and use. Little is known about what beliefs and motivations influence parents' decisions to discuss marijuana use with their children. Guided by the Prototype Willingness Model, we tested hypotheses that higher parental perceived risk of harms, negative prototypes of youth who use marijuana, and worry about the health and social harms of their child using marijuana would predict higher intentions and willingness to have marijuana use discussions with children and that, in turn, intentions and willingness would positively predict having these discussions and behavior. We administered a national, longitudinal survey to American parents of children ages 10 to 17 years old (N = 499) assessing risk perceptions, negative and positive prototypes of youth marijuana users, worry, intentions, and willingness. Participants (N = 409) completed a survey one month later assessing whether they had talked with their child about marijuana use. Overall, 40% of the parents reported having marijuana use discussions over the prior month. Structural equation modeling revealed that higher perceived risks of use (β = .59, p < .001) and less positive prototypes (β = -.34, p < .001) predicted higher worry of harms of marijuana use. Higher worry predicted greater intentions (β = .71, p < .001) and willingness (β = .27, p < .001) to discuss marijuana use with their children. Higher intentions (β= .26, p < .001) and higher willingness (β= .19, p < .001) positively predicted marijuana use discussions one month later. These findings contribute to our understanding of how risk perceptions, prototypes, and worry might shape parent intentions and willingness to discuss marijuana use with their children, with intentions and willingness independently contributing to discussion behavior. Further research can explore how communications targeting these measures might increase parent-child discussions of substance use.

MEDICAL CANNABIS USE AND ALCOHOL USE DISORDER AMONG PATIENTS PRESCRIBED LONG-TERM OPIOID THERAPY

Shannon Nugent, PhD[1], Bobbi Jo H. Yarborough, PsyD[2], Ning Smith, PhD[2], Carla A. Green, PHD, MPH[3], S Dobscha, MD[4], Richard Deyo, MD, MPH[4], B Morasco, PhD[1]

[1]VA Portland Health Care System, Portland, OR; [2]Kaiser Permanente Center for Health Research, Portland, OR; [3]Kaiser Permanente Northwest, Portland, OR; [4]Oregon Health & Science University, Portland, OR

Purpose:

Debate exists about the effectiveness and safety of simultaneous medical cannabis (MC) use and prescription long term opioid therapy (LTOT) among chronic pain patients. Yet, among patients with simultaneous use, little is known about clinical characteristics that may impact safety or suggest a need for additional services. We present baseline data from an ongoing longitudinal study of patients prescribed LTOT to (1) compare clinical characteristics between patients who endorsed using MC for pain and those who did not; and (2) examine associations between alcohol use disorder (AUD) and use of MC.

Methods:

Three hundred seventy-one patients prescribed LTOT were recruited from two large integrated health care systems. Data about opioid status were collected from participants' medical records and data about substance use (including MC), mental health conditions, and pain were assessed with validated self-report measures.

Results:

Mean age was 60.0 (*SD*=11.0), 54% were male, 19% met criteria for a current AUD, and 18% endorsed using MC for pain. Among those using MC, 66% rated it as at least moderately helpful in reducing pain. Bivariate analyses comparing patients who do and do not use MC for pain showed that compared to non-users, MC users had statistically significant higher rates of nicotine use (42% vs 26%), higher mean scores of risk for prescription opioid misuse (16.8, *SD* = 7.5 vs 12.5, *SD* = 7.3), and higher rates of AUD (34% vs 15%). No significant group differences were detected on pain intensity or disability, depression, opioid dose, or anxiety scores. Logistic regression analysis adjusting for clinical and demographic variables revealed that MC

use was associated with an increased likelihood of a current AUD, *OR*=2.21, 95% CI=1.14-4.31, *p*=.02.

Conclusion:

While the majority who used MC reported it to be helpful, MC using patients also had significantly higher rates of AUD. These findings highlight the need to screen for MC use among patients prescribed LTOT and to screen for, and address AUD among patients using MC. Future research could examine the long-term impact of MC use on pain-related outcomes among patients prescribed LTOT.

PREDICTING OPIATE CRAVING WITH GPS DATA: COMPARISON OF MACHINE LEARNING TECHNIQUES ON QUALITY AND USABILITY

William Kowalczyk, PhD, Matthew Tyburski, PhD, Karran Phillips, MD, David Epstein, PhD, Kenzie Preston, PhD

National Institute on Drug Abuse, Intramural Research Program, Baltimore, MD

Some behaviors (e.g. manic episodes, suicide) are better to prevent than to treat in their aftermath. In addiction we want to prevent relapse, a problem that is separate from persistent ongoing drug use. Prior attempts to predict imminent lapse have focused on time scales of weeks, which is problematic when attempting to intervene in a behavior that occurs in a moment. Our goal is to predict behavior in real time, to open up a world of live, just-in-time (JIT) mHealth interventions for drug lapses and other behaviors. The present study takes a step towards that goal by comparing methods for making ambulatory predictions of craving.

In opiate-using, methadone-maintained outpatients (n = 81), we collected GPS data and ratings of opiate craving over 16 weeks. We mapped participants' GPS tracks for the 6.5 hours before each assessment, coding each set of tracks with an independently obtained observer rating of visible neighborhood disorder (NIfETy). We dropped the 90 minutes of NIfETy data immediately preceding an assessment and used the remaining 5 hours to train randomForest (rF) or Support Vector Machine (SVM) models to predict opiate craving (with and without demographic factors, reserving 50% or 10% of the data for testing). We then applied the models in a "24/7" manner, using all the GPS data to examine the utility of the posterior probability scores for possible use in a JIT intervention.

In models without demographic input, the rF approach was clearly better, as SVM failed to predict craving (kappa: rF = 0.59, SVM = 0.0). Models with demographic input predicted opiate craving at levels of excellent agreement using either type of machine learning (kappa for either SVM or rF = 0.63). However, the patterns of prediction differed. In 24/7 models, the scores from rF models tended to form a jittery pattern around a horizontal centroid. In contrast, the scores from SVM models showed very prominent spikes, indicating much more clearly when an intervention should be delivered. This pattern was present for most participants.

Our goal is to harness advances in environmental data to reduce the burdens of behavioral disorders. Both models were able to predict a patient's future state using GPS data, using algorithms that could ultimately run on a smartphone. The SVM predictions had a more desirable pattern with which to use in a JIT mHealth intervention to predict drug lapses. The step represented here may be extended to other behavioral disorders.

CROWDSOURCING DATA COLLECTION FOR PUBLIC HEALTH: A COMPARISON WITH NATIONALLY REPRESENTATIVE TOBACCO DATA

Darren Mays, PhD, MPH[1], Andrew Strasser, PhD[2], Raymond Niaura, PhD[3], Eric Lindblom, JD[4], John Kraemer, JD, MPH[5]

[1]Georgetown University Medical Center, Lombardi Comprehensive Cancer Center, Washington, DC; [2]University of Pennsylvania School of Medicine, Philadelphia, PA; [3]Truth Initiative, Washington, DC; [4]Georgetown University Law Center, Washington, DC; [5]Georgetown University School of Nursing & Health Studies, Washington, DC

Online crowdsourcing platforms such are increasingly used for behavioral research in public health. Crowdsourcing platforms are advantageous because they provide accessibility to existing online populations to gather data efficiently and at relatively low cost. However, the representativeness of crowdsourced samples and generalizability are unclear. This study sought to compare crowdsourced data on tobacco use to publicly available, nationally-representative U.S. survey data, the 2012-2013 National Adult Tobacco Survey (NATS). A sample of 3,999 U.S. young adults ages 18 to 30 years recruited through Amazon Mechanical Turk completed measures taken from NATS assessing demographics, tobacco use behaviors and perceptions, and exposure to tobacco warning labels. Post-hoc sample weights were created for crowdsourced data using procedures similar to the NATS. Weighted analyses compared the crowdsourced and NATS data on demographics, tobacco use behavior, and other measures administered. The crowdsourced sample was comparable to the NATS on variables used to create sample weights (gender, race/ethnicity, cigarette smoking status). Those in the crowdsourced sample were less likely than young adults in the NATS to report a household income of $50,000 per year or higher (25.1% vs. 45.4%, 95% CI diff. -23.0%, -17.7%), and more likely to be married/living with a partner (20.9% vs. 14.8%, 95% CI diff. 3.9%, 8.4%). The prevalence of current use of e-cigarettes (13.9% vs. 2.6%, 95% CI diff. 9.7%, 13.1%), hookah (6.4% vs. 1.9%, 95% CI diff. 3.1%, 5.8%), and cigars (8.4% vs. 3.2%, 95% CI diff. 3.7%, 6.7%) was greater in the crowdsourced sample versus the NATS. High proportions of both samples (ranging from 71.9% to 88.8%) endorsed responses indicating cigarette smoking is very harmful and very addictive. Comparisons of the proportions of non-smokers and smokers in the crowdsourced and NATS data showed similar patterns with respect to the frequency of cigarette warning label exposure. However, the likelihood of reporting that smoking is very harmful by frequency of warning label exposure was lower among smokers in the crowdsourced sample. This study provides some of the first empirical insights into the

ways in which a large, crowdsourced sample compares to national data. Crowdsourced data collection has important applications in public health research (e.g., correlational, experimental studies) but the applicability to answer population-level questions may be limited.

DISPARITIES IN SMOKING AND E-CIGARETTE USE AMONG YOUNG SEXUAL MINORITY MEN

Mary A. Gerend, PhD[1], Michael E. Newcomb, Ph.D.[1], Brian Mustanski, Phd[2]

[1]Northwestern University, Chicago, IL; [2]Northwestern university, Chicago, IL

Background: Because sexual minorities (gay, lesbian, and bisexual individuals) are significantly more likely to use tobacco than their heterosexual counterparts, identifying predictors of tobacco use in these groups is essential. Little is known about which subgroups of men who have sex with men (MSM) are more likely to smoke, and even less is known about MSM's use of new and rapidly changing products like electronic cigarettes (e-cigarettes). This study examined rates and predictors of smoking (combustible cigarette use) and e-cigarette use among 16-29 year-old MSM.

Methods: Participants (N=773) were drawn from the baseline visit of an ongoing longitudinal cohort study of young MSM aimed at identifying multilevel influences on HIV risk and substance use. Sociodemographic correlates (e.g., age, race/ethnicity, education, gender identity, sexual orientation, physical attraction) of smoking and e-cigarette use were examined using logistic regression.

Results: Although only 21% identified as current cigarette smokers, 39% had smoked within the past 30 days. Nearly 40% had ever tried an e-cigarette, but only 4% reported regular current or past e-cigarette use. E-cigarette use was significantly more common among current and former (vs. never) smokers. Predictors of smoking were largely consistent with those observed in the general population (e.g., older age, less education), but also included factors specific to MSM (e.g., HIV positive, more attracted to females than males). Black (vs. white) MSM and participants aged 16-18 (vs. 19-24) were less likely to have ever used e-cigarettes. Regular e-cigarette users were more likely to be transgender (male-to-female), white (vs. black), more educated, and attracted to mostly females, but some males (vs. only males).

Conclusions: Findings highlight potential disparities in smoking and e-cigarette use among young sexual minority men. Although some variables (e.g., gender identity, attraction) demonstrated similar relationships with smoking and e-cigarette use, others (e.g., race, education) demonstrated opposite patterns. Findings underscore the urgent need for tailored tobacco prevention and cessation efforts for young MSM and suggest that different frameworks may be required for different tobacco products.

UNDERSTANDING CIGARETTE SMOKING TRAJECTORIES THROUGH ADOLESCENCE AND WEIGHT STATUS IN YOUNG ADULTHOOD IN THE UNITED STATES

Minal Patel, PhD, MPH[1], Annette Kaufman, PhD, MPH[2], Yvonne Hunt, PhD, MPH[3], Linda Nebeling, PH.D., MPH, RD, FAND[3]

[1]National Cancer Institute, Rockville, MD; [2]Tobacco Control Research Branch, Behavioral Research Program, Division of Cancer Control and Population Sciences, National Cancer Institute, National Institutes of Health, Rockville, MD; [3]National Cancer Institute, Bethesda, MD

Background: Adolescent cigarette smoking has steadily declined since 1999, while obesity rates have quadrupled since the 1980s. Few studies have looked at the longitudinal relationship of smoking and weight in youth and young adulthood. This study examines the relationship of smoking trajectory beginning in adolescence on weight status in young adulthood in a nationally representative US longitudinal sample.

Methods: The study sample was drawn from Add Health Waves I-IV (N=13,361). Four trajectories were generated through repeated-measures latent class analyses using current cigarette smoking status in Waves I-IV and age of initiation: nonsmokers (44%), early establishers (23%), late establishers (21%), and former smokers (12%). Wave IV weight status included self-reported body mass index (BMI) and measured waist circumference (WC). Bivariate analyses addressed associations between smoking trajectory and BMI at each wave. Multivariate linear regression models tested the relationship of smoking trajectory and weight status at Wave IV. Future planned analyses include addressing related health behaviors as potential moderators of the relationship between smoking trajectory and BMI.

Results: Weight status increased over time for all trajectories. In bivariate analyses, early and late establishers had a significantly lower BMI at Wave III and all smoking trajectories had a significantly lower BMI at Wave IV compared to nonsmokers. All smoking trajectories had a significantly lower BMI than nonsmokers [early establishers: (B=-1.27, CI: -1.56, -0.98); late establishers: (B=-0.84, CI: -1.16, -0.52); & former smokers: (B=-0.63, CI: -0.93, -0.34); ($p < 0.05$)] in an adjusted multivariate regression model predicting Wave IV BMI. Males reported a lower BMI ($\beta = -0.28$; CI: -0.53, -0.03) than females. Results predicting Wave IV WC showed a similar trend.

Discussion: Smoking during adolescence does not attenuate the risk of becoming obese in young adulthood, even though smoking trajectories had a lower BMI and WC than nonsmokers. These results have implications for interventions concerning cigarette smoking

and weight control in youth and young adults. Both tobacco use and obesity need to be studied concurrently in order to better understand potential additive and/or synergistic effects among youth and young adults in the US.

MISPERCEPTIONS OF PEER NORMS FOR TOBACCO USE AND PERSONAL USE: EVIDENCE FROM STUDENTS IN GRADES 6-12 ACROSS 63 SCHOOLS IN THE US

Jessica Mayson. Perkins, PhD[1], H. Wesley. Perkins, PhD[2], David Craig, Ph.D.[2]

[1]Massachusetts General Hospital, Cambridge, MA; [2]Hobart and William Smith Colleges, Geneva, NY

Actual peer social norms and students’ perceptions of those norms within the school context may be an important determinant of tobacco use initiation and frequency among adolescents as youth look to peers for social cues on what to believe and how to behave. This study distinguishes between actual and perceived peer norms regarding tobacco use attitudes and behavior, and examines the independent associations of both actual and perceived norms with personal attitude and personal use among U.S. students in grades 6-12. Data were collected from 27,545 students across 63 schools in 11 states from 1999 to 2014 via anonymous surveys. Even though permissive attitudes about tobacco use and the actual prevalence of tobacco use increased across grade and age levels, believing that tobacco use is okay or actually using tobacco during the year was rarely the norm in any grade level in any specific secondary school. However, dramatic misperception was found across a diversity of schools and students. Although 77% of students said tobacco use was never good, 64% of students thought that most others in their grade thought use was okay. Similarly, although 78% of students reported never using tobacco, 67% of students perceived that students in their grade most typically used tobacco monthly or more often. Although the prevalence of misperceptions of the attitudinal and behavioral norms regarding tobacco use was greater and more inaccurate across increasing grade and age levels, these misperceptions were pervasive across all racial categories of students, socio-economic status levels of schools, size of grade cohort in one’s school, and time periods within this study. In addition, perception of the attitudinal norm was highly predictive of personal attitude about use. Moreover, misperceiving tobacco use as the norm among same-grade peers strongly predicted personal tobacco use even after adjusting for the actual same-grade prevalence of tobacco use, personal attitude about use, and several other individual and school-level factors. Researchers should give increased attention to designing experiments to assess causality while also testing interventions to reduce misperceptions, and presumably reduce permissive attitudes and actual use. Furthermore, practitioners could begin to explore comprehensive ways to promote the awareness of positive actual norms related to tobacco use.

Paper Session 21: Influence of Tobacco Advertising 3:00 PM-3:18 PM

PRO-TOBACCO ADVERTISEMENT EXPOSURE AMONG AFRICAN AMERICAN SMOKERS: AN ECOLOGICAL MOMENTARY ASSESSMENT STUDY

Cendrine Robinson, PhD MPH[1], Joanna R. Sells, M.S.[2], Andrew Waters, PhD [2]

[1]National Cancer Institute, Rockville, MD; [2]Uniformed Services University of the Health Sciences, Bethesda, MD

Significance: African Americans live in communities with a disproportionately high density of tobacco advertisements compared to Whites. Some research indicates that point-of-sale advertising is associated with unplanned purchases of cigarettes, craving, and smoking. Most previous research is limited by recall bias and did not focus on African American smokers. Ecological Momentary Assessment (EMA) can be used to obtain prospective associations between tobacco advertisement exposure and smoking in the natural environment. The current study used EMA to assess self-reported advertisement exposure, craving, smoking, purchases, and impulse purchases among African Americans.

Methods: Non-treatment seeking African American smokers (N = 64) were given a mobile device for 2 weeks. They were prompted four times per day to respond to questions about advertisement exposure, craving, smoking, and unplanned purchases. At each assessment, participants reported their craving “right now”, the number of cigarettes smoked “since the last assessment”, the number of advertisements seen “since the last assessment”, and whether they made any unplanned purchases.

Results: Participants provided data on advertisement exposure in 2,298 assessments. Participants reported seeing at least one advertisement in 33.54% of assessments. Among assessments in which an advertisement was seen, 33.07% of assessments had one advertisement, 29.31% had two advertisements, 17.51% had three advertisements, and 20.10% had four or more. Participants reported that 86.82% of advertisements seen were menthol. Number of advertisements seen was positively associated with smoking, F (1,2110) = 112.85 p F (1,1417) = 16.54 p p p > .05.

Conclusions: African American smokers are frequently exposed to pro-tobacco marketing. Advertisement exposure is associated with smoking and impulse purchases, but not craving. Future research should assess advertisement exposure among smokers wishing to quit.

Background: Although the Family Smoking Prevention and Tobacco Control Act of 2009 essentially banned the marketing of any cigarette as “safer” in the United States, more than 2.5 million U.S. consumers believe they are smoking a brand of cigarettes that might be less harmful. This misconception of reduced harm appears to be most common among those who smoke the brand American Spirit.

Methods: Using a between-subject fractional-factorial experiment (3-brands x 3-packaging/ labeling styles), smokers recruited through Amazon Mechanical Turk (N=909) rated their perceptions of a randomly assigned cigarette package. We assessed whether smokers tended to rate the standard packaging of American Spirit Full-Bodied cigarettes higher than the standard packaging of Marlboro Red or Newport Green cigarettes (the most popular U.S. brands) on an 18-point scale assessing whether the packaging conveyed that the cigarettes were less harmful (Cronbach’s α = 0.92). Then, we estimated the effect of standardized cigarette packaging (all branding replaced with a green color) and Australian-like packaging (all branding replaced with a green color and a graphic image) on harm perceptions conveyed through American Spirit packaging, using the same 18-point scale.

Results: Smokers’ ratings of the standard American Spirit package (mean=9.9; standard deviation(SD)=4.4) were 1.5 times (t(df=165.5)=6.0; $p < 0.001$) higher than smokers’ ratings of the Marlboro Red package (mean=6.6; SD=3.4) and 1.4 times (t(df=171.9)=4.9; $p < 0.001$) higher than smokers’ ratings of the Newport Green package (mean=7.0; SD=3.6) on the reduced harm perceptions scale. The standardized packaging had a medium-sized effect (Cohen’s d=0.66; t(df=179.4)=4.5; $p < 0.001$) and the Australian-like packaging had a large effect (Cohen’s d=1.56; t(df=146.3)=10.5; $p < 0.001$) on reducing the perception that American Spirit packaging conveys that its cigarettes are less harmful. The standardized packaging had a negligible effect on reducing harm perceptions conveyed through Marlboro Red (Cohen’s d=0.02; t(df=207.3)=6.7; p=0.87) and Newport Green (Cohen’s d=0.16; t(df=176.5)=1.1; p=0.29) packaging; however, the Australian-like packaging had a large effect on both

Marlboro Red (Cohen’s d=0.88; t(df=207.3)=; $p < 0.001$) and Newport Green (Cohen’s d=0.84; t(df=167.8)=5.7; $p < 0.001$) packaging.

Conclusion: These data suggest that many smokers perceive that American Spirit’s cigarette packaging conveys that its cigarettes are less harmful. The data also suggest that standardized packaging, both with and without warning images, may reduce this perception.

Implication: Standardized packaging may be a viable option for preventing erroneous inferences about harms of cigarettes conveyed through cigarette packaging.

ICONS OF HEALTH EFFECTS OF CIGARETTE SMOKE: A TEST OF SEMIOTIC TYPE

Allison Lazard, PhD[1], Annie Schmidt, BA[1], Huyen Vu, MS[1], M. Justin Byron, PhD[1], Ellen Peters, PhD[2], Marcella H. Boynton, PhD[1], Noel T. Brewer, PhD[3]

[1]University of North Carolina - Chapel Hill, Chapel Hill, NC; [2]The Ohio State University, Columbus, OH; [3]University of North Carolina, Chapel Hill, Chapel Hill, NC

Purpose. U.S. law requires the government to inform the public about the harmful and potentially harmful chemicals in cigarette smoke. Information about these chemicals – and their harmful effects – must be understandable and not misleading. One way to achieve this communication goal is through the use of simple visuals, such as icons. We sought to identify icons to effectively communicate the health harms of cigarette smoke.

Methods. Participants were 701 U.S. adults. Within-subjects online experiments explored the effects of icon semiotic type: symbolic (arbitrary, most abstract), indexical (illustrating evidence of a physical connection), and iconic (representation of an object, most concrete).

Results. For the not-easy-to-visualize harms of cancer and addiction, symbolic icons received higher ratings than other icon types on cognitive and affective reactions (perceived representativeness of the icon, affect toward smoking, elaboration about the harms of smoking, perceived severity of health effects of smoking, perceived effectiveness of the icon for discouraging smoking, and icon preference) (all $p < .001$). For the easy-to-visualize symptoms of heart attack/stroke, indexical icons received the highest ratings (all $p < .001$). For the easy-to-visualize harm of reproductive organ damage, the iconic image did best (all $p < .001$).

Conclusion. Our findings contribute new insights for icon development for health communication – a process that is often anecdotal rather than informed by theory. Using semiotics as a framework to anticipate how people would interpret icons, we found systematic preferences detectable through cognitive and affective responses, as well as through simple preference selection. For communicating harms cause by cigarette smoke, health effects not easily visualized were best represented with symbolic icons. Health effects linked to a specific organ or observable symptom were best represented with iconic and indexical icons, respectively.

MEDIATORS OF THE IMPACT OF PICTORIAL CIGARETTE PACK WARNINGS ON QUIT ATTEMPTS

Noel T. Brewer, PhD[1], Humberto Parada, Jr., PhD, MPH[2], Kurt M. Ribisl, PhD[3]

[1]University of North Carolina, Chapel Hill, Chapel Hill, NC; [2]University of North Carolina at Chapel Hill, Chapel Hill, NC; [3]UNC, Chapel Hill, NC

Background. Pictorial warnings on cigarette packs increase quit attempts, but the mechanism of the effect remains uncertain. We examined several hypotheses about mediators of the impact of pictorial cigarette pack warnings on quit attempts.

Methods. We conducted a 4-week randomized clinical trial in California and North Carolina. We recruited a convenience sample of 2,149 adult cigarette smokers from the general population from September 2014 through August 2015. We randomly assigned participants to receive on their cigarette packs for 4 weeks either a text-only warning (one of the Surgeon General's warnings currently in use in the United States on the side of the cigarette packs) or a pictorial warning (one of the Family Smoking Prevention and Tobacco Control Act's required text warnings with pictures that showed harms of smoking on the top half of the front and back of the cigarette packs). The primary trial outcome was attempting to quit smoking during the study. Analyses were intent-to-treat: 1) warnings to quit attempts (c path), 2) warnings to mediators (a path), and 3) multivariable analysis of the full mediational pathways from warnings to mediators to quit attempts (a*b paths).

Results. First, smokers whose packs had pictorial warnings were more likely than those whose packs had text-only warnings to attempt to quit smoking during the 4-week trial (40% vs 34%; odds ratio=1.29; 95% CI, 1.09-1.54). Second, pictorial warnings increased several potential mediators: attention to the warning message, 8 different warning reactions such as negative affect and avoidance, and social interactions about the warnings (*p*. < 05). However, pictorial warnings changed only 2 of 15 belief and attitude measures (*p*. < 05). Third, pictorial warnings led to greater avoidance of the warnings which led to more quit attempts (mediation, *p*. < 05). Other mediators were cognitive elaboration (thinking about the warning and harms of smoking), negative pack attitudes, and quitting self-efficacy (all, *p*. < 05).

Discussion. Pictorial warnings increased quit attempts by both creating aversive reactions and by keeping the message vividly in smokers' minds. Contrary to predictions from several theories of health behavior, the warnings exerted little of their influence through changes in beliefs and attitudes and none of their influence through changes in risk perception.

Paper Session 21: Influence of Tobacco Advertising 4:13 PM-4:30 PM

WHY DO PEOPLE USE ELECTRONIC NICOTINE DELIVERY SYSTEMS (ELECTRONIC CIGARETTES)? A CONTENT ANALYSIS OF TWITTER, 2012-2015

John Ayers, PhD MA, Jon-Patrick Allem

http://www.johnwayers.com/, Chula Vista, CA

The reasons for using electronic nicotine delivery systems (ENDS) are poorly understood and primarily documented by expensive cross-sectional surveys that force respondents to adhere to investigator's preconceived notions rather than using their own words. We passively identify the reasons for using ENDS longitudinally from a content analysis of public postings on Twitter. All English language public tweets including several ENDS terms (*e.g.*, “e-cigarette” or “vape”) were captured from the Twitter datastream during 2012 and 2015. After excluding spam, advertisements, and retweets, posts indicating a rationale for vaping were retained. The specific reasons for vaping were then inferred based on a supervised content analysis using annotators from Amazon’s Mechanical Turk. During 2012 quitting combustibles was the most cited reason for using ENDS. Forty-three percent (95%CI 39-48) of all reason-related tweets cited quitting combustibles, *e.g.*, *“I couldn’t quit till i tried ecigs,”* eclipsing the second most cited reason by more than double. Other frequently cited reasons included social image (21%; 95%CI 18-25), use indoors (14%; 95%CI 11-17), flavors (14%; 95%CI 11-17), safety relative to combustibles (9%; 95%CI 7-11), cost (3%; 95%CI 2-5) and lack of odor (2%; 95%CI 1-3). By 2015 the reasons for using ENDS cited on Twitter had shifted. Both quitting combustibles and use indoors significantly declined in mentions to 29% (95%CI 24-33) and 12% (95%CI 9-16). At the same time, social image increased to 37% (95%CI 32-43) and lack of odor increased to 5% (95%CI 2-5), the former leading all cited reasons in 2015. Our data suggest the reasons people vape are shifting away from cessation and toward social image. These data also show how the ENDS market is responsive to a changing policy landscape. For instance, smoking indoors was less frequently cited in 2015 as indoor smoking restrictions where applied to vaping in many places since 2012. Because the data and analytic approach are scalable, adoption of our strategies in the field can inform follow-up survey-based surveillance (so the right questions are asked), interventions, and policies for ENDS.

Paper Session 22: HIV in Low-Resource Settings 3:00 PM-3:18 PM

HIV VULNERABILITY AMONG ZAMBIAN MIGRANTS AND MOBILE POPULATIONS

Stefani Butts, BA[1], Nicole Barylski, N/A[2], Maria L. Alcaide, MD[1], Violeta J. Rodriguez, MSED[1], Annette Kayukwa, MPH[3], Stephen M. Weiss, PhD, MPH[1], Jackson Thoya, Deborah L. Jones, PhD, M.Ed.[1]

[1]University of Miami Miller School of Medicine, Miami, FL; [2]University of Miami, Elmwood Park, NJ; [3]University of Zambia/Maimi University, Lusaka, Lusaka, Zambia

HIV vulnerability among Zambian migrants and mobile populations

Introduction: Migrant and mobile populations (MMP) throughout Zambia face unique barriers to accessing HIV counselling, testing, and treatment associated with employment-driven mobility. These factors in combination with elevated alcohol consumption heighten MMP's risk of HIV infection and transmission. This qualitative study assessed barriers to accessing HIV prevention and treatment services among MMP within Zambia, and explored potential strategies to reduce barriers and enhance HIV prevention.

Method: This studyutilizedCommunity Based Participatory Research methods to investigate MMP risk factors and proposed community-based HIV prevention strategies in Zambian districts with the largest communities of MMP (Chingola, Mazabuka, Mufulira). Male and female urban and rural Zambian MMP were enrolled in focus group discussions (n =137) and key informant interviews (n=156). MMPs were primarily miners, cane cutters, mobile contractors, truck drivers, sex workers and fisher folk. Stem questions explored HIV risk factors and strategies to address barriers and facilitators of condom use, VCT and HIV treatment. Resulting content was coded for dominant themes.

Results: Mobility increased the opportunity for large sexual networks and networking with multiple partners. Local bars, lodges and truck stops were the primary locations for sexual solicitation of MMP. Cheap, easily accessible short term lodging were hot spots for HIV risk behavior and provided convenient venues for sexual exchange. Difficulty accessing support groups, condoms, HIV treatment and health information and counseling due to transience placed MMP at elevated risk. A lack of clinics in less accessible rural areas such as truck stops and country borders exacerbated HIV risk, particularly among female MMP. Proposed initiatives to reduce risk included promotion of border-based health clinics and employer-driven programs to provide medical support and health resources to MMP. Regulation of bars and lodges to reduce their use by sex workers was proposed, as well as economic stimulus programs for sex workers to reduce their reliance on survival-based sex exchange.

Discussion: Barriers to HIV prevention tools in combination with large sexual networks increase HIV vulnerability among Zambian MMP. Stimulation of economic opportunities for commercial sex workers serving MMP should be explored as an avenue to substantially reduce HIV risk. Involvement of MMP employers, Zambian governmental agencies and district health facilities are needed to implement educational and social programs tailored to the MMP lifestyle and respond to urgent health needs.

Paper Session 22: HIV in Low-Resource Settings 3:19 PM-3:36 PM

IMPACT OF DEPRESSION IN HIV-INFECTED WOMEN ON INFANT DEVELOPMENT IN RURAL SOUTH AFRICA

Violeta J. Rodriguez, MSED[1], Gladys Matseke, MS[2], Audrey Mathebula, BA(Hons)[2], Ryan Cook, MSPH[1], Maria L. Alcaide, MD[1], Stephen M. Weiss, PhD, MPH[1], Karl Peltzer, PhD[2], Deborah L. Jones, PhD, M.Ed.[1]

[1]University of Miami Miller School of Medicine, Miami, FL; [2]Human Sciences Research Council, Pretoria, Gauteng, South Africa

Introduction: High rates of depression have been identified among pregnant women living with HIV (WLHIV) in rural South Africa (49%). Pregnancy-related depressive episodes among WLHIV are associated with decreased prenatal care, and increased alcohol use and interpersonal disengagement. HIV-exposure has also been associated with developmental delays in infants, and HIV-exposed infants born to depressed women may be at an even greater risk for adverse developmental outcomes. This study examined the impact of depression in HIV-infected women in rural South Africa (SA) on infant development at 12 months of age.

Method: Participants (n = 68) were mother-infant dyads recruited from antenatal clinics in rural SA. All women had a male partner. Women were 18 ± 5 weeks pregnant at enrollment and completed assessments of demographics, HIV disclosure status, pre- and postnatal depression, male involvement during pregnancy, and alcohol use at baseline and 12 months postpartum. Infant HIV serostatus (PCR) and domains of developmental functioning (cognitive, expressive and receptive communication, and fine and gross motor) were assessed at 12 months of age.

Results: Women were an average of 29 ± 5 years old. One-third had completed at least 12 years of education, and 32% had a monthly income of ~US$76. Two-thirds of the pregnancies were unplanned, and 45% of the women were diagnosed with HIV during pregnancy (average time since diagnosis: 32 ± 43 months); 59% had disclosed their HIV status to their partners. Nearly half (45%) were depressed and 16 were referred for treatment for antenatal depression. Four infants (6%) tested positive for HIV at 12 months. Infant seropositive HIV status was associated with delayed receptive communication in bivariate analyses. In multivariate analyses, not being married to their partner (p = .028), nondisclosure of HIV status (p = .016), and postnatal depression (p = .038) predicted infant cognitive delay at 12 months of age. There also was an association between decreased prenatal male involvement

and delayed infant gross motor development at 12 months (*p* = .002) and a non-significant trend between delayed receptive communication and postnatal depression (*p* = .090),

Discussion: Findings highlight the need for healthcare providers to assess postpartum depression among pregnant WLHIV, given its negative impact on infant development. Interventions to support the mental health of pregnant WLHIV and increase male partner involvement may enhance antenatal care and neonatal development outcomes in rural SA. Further research examining child development theories in the South African context may be merited to inform pedagogical approaches to managing developmental delay among infants born to HIV-infected mothers experiencing postpartum depression.

REDUCING HIV VULNERABILITY AMONG ZAMBIAN ADOLESCENT GIRLS AND YOUNG WOMEN

Stefani Butts, BA[1], Lauren E. Parmley, BA[2], Maria L. Alcaide, MD[1], Violeta J. Rodriguez, MSED[1], Annette Kayukwa, MPH[3], Stephen M. Weiss, PhD, MPH[1], Jackson Thoya, Deborah L. Jones, PhD, M.Ed.[1]

[1]University of Miami Miller School of Medicine, Miami, FL; [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD; [3]University of Zambia/Maimi University, Lusaka, Lusaka, Zambia

Reducing HIV vulnerability among Zambian adolescent girls and young women

Introduction: HIV/AIDS is the leading cause of death for adolescent girls and young women (AGYW) aged 15 to 24 in Zambia. AGYW have the highest rates of HIV infection in Zambian risk groups (e.g., 13% girls, 7% boys). Social and economic factors, including low social and economic status, unemployment and early marriage, make AGYW especially vulnerable to HIV. This qualitative study examined the sociocultural context and behavioral factors placing AGYW at risk and explored community-based solutions to prevent HIV infection among AGYW.

Method: Community Based Participatory Research methods were used to assess HIV AGYW risk factors and proposed community-based prevention strategies in Zambian provinces with high HIV prevalence (Lusaka, Copperbelt, Southern Provinces). Urban and rural participants (n = 566 males and females aged 15 - 75 years) were enrolled in focus group discussions (73 groups) and key informant interviews (n = 128), and content was coded for dominant themes.

Results: Gender inequity underlay HIV vulnerability in AGYW. The potential to complete school and options for employment among AGYW were diminished by traditional gender roles and inequity, resulting in sexual exchange, sex work and intergenerational sex. Sexual practices increasing HIV risk were sustained by men's sexual preferences and dominance in sexual decision making, and often enforced by physical violence and sexual assault. Both genders reported sexual risk associated with alcohol use; violence was more prevalent in rural communities. Governmental agency and NGO programs were proposed to implement economic stimulus strategies, e.g., loans for small businesses, financial aid for AGYW students, particularly targeting those engaged in sex work. Community sensitization for both women and men was encouraged, with a focus on empowering women, risky traditional practices, youth friendly clubs and support groups.

Discussion: Gender equity appears critical for HIV prevention in AGYW. Current Zambian government initiatives target equity and the reduction of gender-based violence, but community-based and endorsed programs are needed to promote and facilitate education and financial security among AGYW, and reduce dependence on survival-based sexual exchange. Community buy-in for gender equity programs, particularly in rural areas, should be sought to reduce resistance to initiatives to enhance the status of women. While women's voices are increasingly heard, men play a key role in bridging the gap between gender disparities. Both male and female opinion leaders are needed to champion equity between genders, and future research should involve both genders to establish new social norms for women.

MERITORIOUS AWARD WINNER

IMPACT OF A FAMILY-BASED PREVENTION PROGRAM ON ECONOMIC COMMUNICATION AND HOUSEHOLD ECONOMICS: RESULTS OF A RANDOMIZED TRIAL

Elsa Friis, MSc[1], Eric Green, PhD[2], Eve Puffer, Ph.D.[1]

[1]Duke University, Durham, NC; [2]Duke Global Health Institute, Durham, NC

Objective. Evaluate effects of a family- centered HIV intervention in rural Kenya on secondary outcomes including family economic communication and household economic behavior including budgeting, saving, and spending on youths' basic needs in rural Kenya.

Method. The intervention was developed using community-based participatory methods and focused on strengthening family relationships to improve future developmental outcomes for youth and reduce HIV acquisition. Modules addressed economic empowerment, emotional support, and HIV knowledge and prevention skills using evidence-based strategies informed by social cognitive theory and culturally grounded content. The intervention was delivered in four churches and evaluated using a stepped wedge cluster randomized trial. Participants included 124 families (237 adolescents ages 10-16; 203 caregivers) and interviewer-administered surveys were completed over 5 rounds. Primary outcomes included: engagement in income generating activities, couples economic communication, having a household budget, amount of household savings, spending on youths' basic needs, and youth-reported material resources. Intent-to-treat effects were estimated via ordinary least squares regression with clustered standard errors.

Results. The majority of participants initiated new income generating activities following the intervention. The intervention significantly increased couples economic communication 1 month post intervention compared with controls as reported by females and males (effect size, female = 0.12, $p < 0.05$; effect size, male = 0.09, $p < 0.05$). There was no effect on household savings, but the intervention had small effects on household spending on youths' clothing (effect size = 0.37, $p < 0.05$) and on youth-reported ownership of shoes (effect size = 0.19, $p < 0.05$). No effects were observed for other indicators of spending and youth material resources.

Conclusions. Results suggest that a family-strengthening intervention can change family interaction patterns related to finances, a major source of conflict and risk factor for HIV acquisition, especially in very low-resource settings. However, limited treatment effects on

youth provision suggest that some effects on actual spending behavior may take longer to emerge or that more focused interventions, such as direct financial assistance, are needed in this context to effect large changes.

PASSIVE SPIRITUAL HEALTH LOCUS OF CONTROL IS ASSOCIATED WITH LOWER PHYSICAL ACTIVITY LEVELS IN AN URBAN, FAITH-BASED COMMUNITY

Alyssa T. Brooks, PhD[1], Samantha Louis Thomas, BS[2], Gwenyth R. Wallen, PhD, RN[3], Colby Ayers, MS[4], Valerie Mitchell, BA[5], Tiffany Powell-Wiley, MD, MPH, FAHA[6]

[1]National Institutes of Health Clinical Center, Bethesda, MD; [2]Office of Intramural Training and Education of the National Institutes of Health (NIH), National Institutes of Health, Bethesda, MD; [3]Clinical Center, National Institutes of Health, Bethesda, MD; [4]UT Southwestern, Dallas, TX; [5]NIH/National Heart, Lung and Blood Institute, Bethesda, MD; [6]National Heart Lung and Blood Institute, National Institutes of Health, Bethesda, MD

Background: Assessing one's *spiritual health locus of control* (SLOC) provides a way to examine how spiritual beliefs may be related to health outcomes based on whether an individual has an "*active*" or "*passive*" orientation to his or her health behaviors. While an individual with an "*active*" SLOC believes that God *empowers* them to take personal healthy actions, an individual with a passive SLOC relies on God to take care of his/her personal health.There is some evidence of SLOC being associated with health behaviors in African-American communities. Less is known about the relationship between SLOC, physical activity (PA) behaviors, and the use of wearable mobile health (mHealth) PA-monitoring technology. This analysis examines the relationship between SLOC, health behaviors, and the use of mHealth technology in a predominantly African-American church population in at-risk Washington, D.C. communities.

Methods: This analysis was conducted using data from a community-based participatory research (CBPR) study designed to evaluate psychosocial and environmental factors associated with cardiovascular health in a predominantly African-American church population in at-risk Washington, D.C. communities (NCT#01927783). Participants (n=99, 78% female, 99% African American) also received a mHealth PA monitor and were instructed to wirelessly upload PA data weekly to church-based data collection hubs. Participants viewed PA data on home- or church-based computers. SLOC was captured using a 13-item validated and scored SLOC scale. Associations between PA and mHealth usage and SLOC scores were evaluated by Spearman correlation coefficients (r_S).

Results: Among participants (age: 58 ± 11.0 years; BMI: 33±7 kg/m^2), median score for active and passive SLOC was 46 (interquartile range [IQR]=41-51) and 3 (IQR=2-5) points respectively. Increasing passive SLOC was associated with less leisure-time vigorous PA in minutes/week (r_S=-0.30, p=0.04), more hours watching TV/week (r_S=0.26, p=0.01), and annual household income under $60,000 ($r_S$=0.34, p= 0.001). There was no association between

mHealth device usage and passive SLOC (r_S=-0.08, p=0.43). In contrast, active SLOC was not associated with PA, sedentary time, or mHealth device usage (p >0.05 for all).

Conclusions: Among faith-based communties in at-risk Washington, D.C. areas, those with passive SLOC may be less likely to engage in leisure-time PA. These findings highlight the potential for SLOC to identify a target population for a CBPR-designed PA intervention in this community**.** SLOC does not appear to be a barrier to mHealth PA-monitoring device usage in this population. Thus, mobile health technology may serve as a useful method to help engage at-risk, faith-based populations from urban communities in increased PA for improved cardiovascular health.

Paper Session 23: Complementary and Integrative Approaches to Health 3:19 PM-3:36 PM

PRELIMINARY EFFECTS OF A MINDFULNESS-BASED INTERVENTION FOR LATINO YOUTH WITH PSYCHOLOGICAL DISTRESS

Cara Young, PHD, RN, FNP-C, Rodolfo Aguilar, RN, Adama Brown, PhD

The University of Texas at Austin, Austin, TX

Nearly one third (~30%) of United States adolescents report disturbances in their usual activities due to feelings of sadness and hopelessness, and Latino adolescents consistently report higher levels of depressive symptoms and disorders than their non-Hispanic White, African American and Asian American peers. A substantial body of literature with adults supports the effectiveness of mindfulness-based interventions in the reduction of several forms of psychological distress, including depression. Mindfulness –based studies with adolescents suggests similar effects, although limited evidence exists regarding the impact of mindfulness interventions with diverse populations of youth. The purpose of this study, therefore, was to test the feasibility and preliminary effects of a mindfulness-based training program with at-risk adolescents from a predominantly Hispanic/Latino community. A single group, pre- and post-test intervention design was used to test a five week, group-based mindfulness intervention with young adolescents (12-15 years) reporting high levels of perceived stress or brooding. Participants were recruited from a pediatric primary care clinic serving un-insured and underinsured families in the southern United States. Measures of perceived stress, brooding, self-esteem, depressive symptoms, and mindfulness were completed by adolescents at baseline and immediately post-intervention. Participants are currently completing a 1 month post-intervention assessment. Seven adolescents (57% female, 85% Hispanic/Latino) of 15 interested met study inclusion and exclusion criteria and were able to attend the weekend sessions. 100% participation in all sessions was achieved with two participants completing one make-up session each. Wilcoxon-Signed Rank Tests were used to evaluate pre- to post-intervention changes in key study variables. Statistically significant improvements were detected in depressive symptoms ($Z=-2.37$, $p=.018$), perceived stress ($Z=-2.02$, $p=.043$), and self-esteem ($Z=-2.20$, $p=.028$). No statistically significant changes were identified with brooding or mindfulness. Preliminary results suggest brief mindfulness interventions may be effective at reducing depressive symptoms and perceived stress and enhancing self-esteem in high risk adolescents. The lack of change with brooding and mindfulness warrants further study as both have been suggested as mechanisms through which mindfulness-based interventions exert their effect. One month post-intervention assessments will provide additional evidence as to the sustained effects of the intervention.

YOGA THERAPY FOR VETERANS WITH CHRONIC LOW BACK PAIN

Erik Groessl, PhD[1], Lin Liu, Ph.D.[2], Laura Schmalzl, PhD[3]

[1]University of California San Diego, La Jolla, CA; [2]University of California, San Diego, La Jolla, CA; [3]University of California San Diego, Encinitas, CA

Military veterans are more likely to have chronic low back pain (CLBP) than non-veterans, and many current treatment options such as opioid medications have limited effectiveness and/or significant side effects. Hatha yoga has been shown to improve CLBP in non-veteran populations, but has not been well studied among military veterans with CLBP. We present the main results of a randomized, controlled trial (RCT) of yoga for military veterans with CLBP. Participants were recruited through primary care and specialty clinics at VA San Diego. Eligible patients were randomized to either yoga or a delayed treatment comparison group. Yoga consisted of 2x weekly yoga sessions for 12 weeks. Yoga home practice was encouraged via a manual. Both groups received usual care and were asked to not change other CLBP treatments unless medically necessary. The primary outcome was back-specific disability (RMDQ). Secondary outcomes included pain severity, pain interference, fatigue, quality of life, and depression. Assessments occurred at baseline, 6-weeks, 12-weeks, and 6-months. Multivariable random effects models were used in intent-to-treat analyses of change in health outcomes by treatment group over time. 150 VA patients with CLBP were enrolled in 6 cohorts. Participant had a mean age of 53.4 years; 26% were women, 51% were non-White or Hispanic, 34% were employed, and 18% were homeless in last 5 years. At baseline, 20% were taking opioid, 15.0 years was the mean duration of CLBP, and 61% had never tried yoga. For the primary outcome, both groups reported less disability at 12-weeks ($p < 0.05$), but group differences were not significant. However, at 6-months, yoga participants had significantly greater reductions in disability ($p = 0.003$). Yoga participants also had greater reductions in pain severity, pain interference, SF-12 Physical, and fatigue at 12-weeks ($p < 0.05$), and at 6-months, greater reductions in pain severity and fatigue ($p < 0.05$). Attendance was lower than expected, with 53% of yoga participants attending at least 12 of the 24 sessions. A main effect of reduced use of opioid medications and other medical pain treatments was also found. In conclusion, although some veterans receiving VA care faced numerous challenges with attending the 2x weekly yoga sessions, intent-to-treat analyses indicate that yoga participants reported better outcomes after 12 weeks and after 6 months. Efforts to increase accessibility and facilitate attendance may result in stronger effects in the future.

SELF-COMPASSION AND MINDFULNESS: THE RELATIONSHIP WITH DISORDERED EATING, APPEARANCE-MOTIVATED EXERCISE, AND DEPRESSION

Mandrila Das, B.A., Steven Richards, PhD Clinical Psychology, Brandy Piña-Watson, Ph.D.

Texas Tech University, Lubbock, TX

Background: Disordered eating is a prevalent problem among college students in the United States (Eisenberg, Nicklett, Roeder, & Kirz, 2011). Past research shows that the percentage of students eating according to a special weight loss diet increased from 4.2% in 1995 to 22% in 2008 (White, Reynolds-Malear, & Cordero, 2011). Although concerns with weight and body appearance have become readily accepted by society, they can often develop into serious problems, which affect mental and physical health. The present study examined the role of self-compassion and mindfulness in predicting disordered eating behaviors, depression, and appearance-motivated exercise among college students. **Methods:** Participants were 732 college students, both male (46%) and female (54%), ages 18-25 (*M*=19). Hierarchical regression analysis was conducted to test main and interaction effects of self-compassion and mindfulness on disordered eating behaviors, appearance-motivated exercise, and depression.

Results: Self-compassion was a significant negative predictor of disordered eating behaviors, appearance-motivated exercise, and depression. Mindfulness was a significant negative predictor of disordered eating and depression, and a partial negative predictor of appearance-motivated exercise.

Conclusion: Results of this study suggest that self-compassion and mindfulness may serve as protective factors for disordered eating, depression, and appearance-motivated exercise. The present study provides support for the advancement of self-compassion and mindfulness research. These findings build on previous research suggesting that self-compassion and mindfulness may reduce the risk of disordered eating behaviors and depressive symptomology. Additionally, self-compassion may reduce the desire to exercise for appearance-motivated reasons. One possible explanation, which builds on previous research, is that self-compassion promotes body acceptance, which in turn reduces the need to exercise to control one's appearance. While research on self-compassion in the exercise domain is fairly limited, this study provides initial support for further research in this area.

RELIGIOUS COMMITMENT MODERATES THE RELATIONSHIP BETWEEN SYMPTOM BURDEN AND POSITIVE AFFECT

Andrea L. Canada, Ph.D.[1], Peter Hill, PhD[2], Neal Krause, Ph.D. [3], Gail Ironson, MD, PhD[4]

[1]Biola University, La Mirada, CA; [2]Rosemead School of Psych., Biola University, La Mirada, CA; [3]University of Michigan, Bloomington, IN; [4]University of Miami, Miami, FL

Religious Commitment Moderates the Relationship Between Symptom Burden and Positive Affect

Background: Religion/spirituality has consistently been linked to positive affect; conversely, physical symptom burden has demonstrated an association with negative emotion. It is not clear, however, if religion/spirituality offers protection against the deleterious effects of higher symptom burden levels on positive affect.

Methods: In the Landmark Spirituality and Health Survey study, a representative sample of the U.S. population (N=3,010), completed a survey measuring physical and mental health indices as well as a variety of religious/spiritual dimensions. Specific variables of interest included physical health symptoms, religious commitment, and the positive emotions of gratitude, hope, and meaning in life. Hierarchical regression analyses were used to test if religious commitment moderated the associations between symptom burden and positive affect.

Results: Controlling for covariates, religious commitment and symptom burden were significantly associated with each positive affect (ps $< .001$). Entering the interaction term between religious commitment and symptom burden further accounted for a significant proportion of the variance in gratitude ($\Delta R^2 = .003$, $\Delta F(1, 2742) = 6.667$, $b = .017$, $t = 3.110$, $p = .002$), hope ($\Delta R^2 = .005$, $\Delta F(1, 2695) = 15.501$, $b = .027$, $t = 3.937$, $p < .001$), and meaning in life ($\Delta R^2 = .004$, $\Delta F(1, 2680) = 13.148$, $b = .035$, $t = 3.626$, $p < .001$).

Conclusion: Participants with higher levels of religious commitment had greater gratitude, hope, and meaning in life than those with less religious commitment in the context of high symptom burden. As such, the religious commitment should be supported within the healthcare setting.

BRIEF BEHAVIORAL INTERVENTIONS FOR BEHAVIORAL MEDICINE CONCERNS FOR USE IN ADULT PRIMARY CARE SETTINGS: A SYSTEMATIC REVIEW

Jennifer S. Funderburk, PhD[1], Robyn L. Shepardson, PhD[1], Jennifer M. Wray, PhD[2], John Acker, M.S.[3], Kyle Possemato, Ph.D.[4], Gregory Beehler, PhD, MA[5], Laura Wray, PhD[6]

[1]VA Center for Integrated Healthcare, Syracuse, NY; [2]Ralph H. Johnson VA Medical Center, Buffalo, NY; [3]Syracuse VA Medical Center, Syracuse, NY; [4]Syracuse Veterans Affairs Medical Center, Syracuse, NY; [5]VA Western New York Healthcare System, Buffalo, NY; [6]VA Center for Integrated Healthcare, Buffalo, NY

Large healthcare organizations (e.g., Department of Defense, Veterans Health Administration) are embracing the Primary Care Behavioral Health (PCBH) model of integrated primary care. Although evidence-based behavioral interventions exist that target a variety of behavioral medicine concerns, integrated behavioral health providers need interventions that are sufficiently brief (i.e., ≤6 sessions) to be compatible with the PCBH model. Therefore, we conducted a systematic review of published studies examining behavioral interventions targeting behavioral medicine concerns that can be employed by PCBH providers in adult primary care settings. Our literature search targeted behavioral medicine concerns identified as prevalent within primary care or among patients seen in PCBH. A total of 67 published articles representing 63 original studies met eligibility criteria. We extracted data on the behavioral interventions employed, results comparing the active intervention to a comparison group, general fit with the PCBH model, and methodological quality. The vast majority of studies (*n*=47) examined brief interventions targeting either sleep difficulties or increasing physical activity, with no studies targeting sexual health or sleep apnea, and ≤5 studies targeting each of the remaining domains. The most commonly employed interventions comprised techniques derived from cognitive behavioral therapy (CBT) and motivational interviewing (MI). Outcomes were generally statistically significantly in favor of the active intervention groups relative to comparison groups, with highly variable methodological quality ratings (range=0-5; *M*=2.0). Results will be discussed in relation to the need for more evidence for brief behavioral interventions targeting other behavioral medicine concerns, as well as the need for more specificity regarding the compatibility of such interventions with the PCBH model of care.

MEASURING THE NEED AND IMPACT OF BEHAVIORAL HEALTH CONSULTANTS IN PRIMARY CARE

William Sieber, PhD[1], Alexandra Lambeck, B.S.[1], Zephon Lister, PhD, LMFT[2], Katrin Seifert, PsyD[3]

[1]UC San Diego, La Jolla, CA; [2]University of California, San Diego, Menifee, CA; [3]University of California San Diego, La Jolla, CA

One proposed benefit of collaborative care, or integrated behavioral health, is that “warm hand-offs” from primary care physicians (PCPs) to behavioral health providers (BHPs) increase the chance that the patient in need will follow through with a referral for specialty mental health care. However a research gap exists estimating the actual increase in the rate of follow-through that such a “warm hand-off” provides, as well as which factors moderate this impact. In fact few if any research reports have documented what evidence-based activities the BHP provides. A unique opportunity to address this research gap was presented when BHPs were available only during certain times across 3 primary care outpatient clinics operating within a larger university-based healthcare system. While a BHP is trained to provide evidence-based brief interventions to patients, oftentimes they also support a referral from the PCP to psychotherapy or health coaching, if warranted. However, there is a paucity of research literature quantifying the various activities of BHPs, nor of the frequency of their use, or the impact on patient completion of a referral for more extended care.

Data was extracted from an EHR on all patients presenting to any of 3 primary care clinics between January 1, 2016 and May 31, 2016, with follow-up data on visits for specialty mental health care extracted through July 31, 2016. A total of 14,748 patient visits resulted in a total of 649 referrals for psychotherapy, of which 216 had involved a BHP warm hand-off at the time of referral. One-way ANCOVAs showed that patients referred for therapy associated with a BHP warm hand-off were more likely to be seen by a psychotherapist within 60 days of referral than patients referred without such BHP involvement ($\underline{p} < .05$). Regression analyses suggest that the factors most predictive of patient follow-through with a referral were BHP warm hand-off, female gender, and diagnosis of patient by PCP at time of referral (PTSD & anxiety > depression & stress, $\underline{p} < .05$).

Overall, BHPs were more often called upon by PCPs when the patient was non-white, male, and on private insurance. Overall, we found a significant impact of a warm hand-off on referral follow-through rates ($\underline{p} < .05$) but more often when the patient was female, an ethnic minority, or had a specific DSM diagnosis already in their medical record. Analyses also revealed that when BHPs were available, they were most often used by PCPs to assess suicide risk, provide information on sleep, use motivationla interviewing and SMART goals for weight loss and physical activity, address medication adherence barriers, or increase support for follow-through for specialty mental health care.

This demonstrates that the benefit of short behavioral medicine interventions is not that they can help all patients equally, but rather that they can have a substantial impact on certain subsets of the community. Further analsyes on the different activities of the BHPs and the implications of this on further development of integrated behavioral health services will be discussed.

FACTORS INFLUENCING SUICIDE RISK ASSESSMENT AND MANAGEMENT IN VA PRIMARY CARE SETTINGS

Megan Petrik, PhD, LP[1], Benjamin F. Miller, PsyD[2], Bridget Matarazzo, PsyD[3]

[1]University of Minnesota Medical School, Minneapolis, MN; [2]Eugene S. Farley, Jr. Health Policy Center, Aurora, CO; [3]Rocky Mountain MIRECC, Denver, CO

Background: Individuals who die by suicide are commonly seen in primary care in the months prior to death (Ahmedani et al., 2014). One tool to improve primary care suicide prevention is the Veterans Affairs/Department of Defense Clinical Practice Guideline for the Assessment and Management of Patients at Risk for Suicide (2013; VA/DoD Suicide Risk CPG), as it offers an algorithm for evidence-based assessment and management of suicide risk in primary care. CPGs alone minimally change provider behavior. Thus, understanding the context of the practice environment, which can be obtained through stakeholder viewpoints, is essential to successful CPG implementation (Stetler et al., 2011).

Aim: Obtain VA primary care provider (PCP) perspectives regarding the barriers and facilitators of suicide risk assessment and management and the impact of integrated mental health services on PCP suicide risk assessment and management practices.

Methods: Eleven VA PCPs in four states (AK, CO, UT, VT) participated. PCPs completed a semi-structured qualitative interview that took on average 26 minutes (SD = 8.6). Data was analyzed using a hybrid inductive-deductive thematic analysis approach.

Results: Qualitative analysis identified the following themes: (1) suicide risk assessment and management is most effective when conducted as a collaborative, team-based endeavor; (2) integrated mental health providers are an outlet for suicide prevention training; (3) variability in access to mental health follow-up care impacts management; and (4) VA-system suicide prevention efforts supports generalists' ability to assess and manage suicide risk.

Discussion: Results from this multi-site qualitative study produced cross-cutting themes regarding the barriers and facilitators of suicide prevention in VA primary care settings. Nuanced implementation implications that are informed by the results will be discussed. Adherence to the VA/DoD Suicide Risk CPG would likely enhance PCPs' delivery of evidence-based care for suicide risk in primary care and may reduce Veteran deaths by suicide.

PHYSICIAN MANAGEMENT OF BEHAVIORAL HEALTH CONCERNS IN PRIMARY CARE PATIENTS AND ITS IMPLICATION FOR RESOURCE UTILIZATION

Marisa Sklar, PhD[1], Cara Fuchs, PhD[2], Daniel R. Evans, Ph.D.[3], Lisa A. Uebelacker, PhD[4], Justin Nash, PhD[5]

[1]Brown University, providence, RI; [2]Brigham and Women's Hospital, Jamaica Plain, MA; [3]University of Washington Medical Center, Seattle, WA; [4]Brown University and Butler Hospital, Providence, RI; [5]University of Connecticut, Storrs, CT

Although behavioral health services are increasingly offered in primary care, physicians continue to manage behavioral health needs in most patients. Understanding physicians' ability to manage behavioral health concerns in patients can guide the design of behavioral health services in primary care. We surveyed physicians' perceived ability to diagnose and manage depression, anxiety, and bipolar disorders in their patients. Physicians included residents in training and attending faculty from a family medicine residency practice in an underserved community.

Repeated measures General Linear Models tested main effects of disorder type and provider type, and their interaction effects. Separate analyses compared responses by resident to faculty providers (noted by $_{FvsR}$), and by resident year (noted by $_{Ryear}$). Special contrast follow-ups tested differences by disorder type, and polynomial trend follow-ups tested differences by resident year. Some significant results follow. Main effects of disorder type (($F_{FvsR}(2, 42)=24.45$, $p < .001$); ($F_{Ryear}(2, 28)=20.38$, $p < .001$)), provider type ($F(1, 21)=5.86$, $p=.025$), and resident year ($F(2, 14)=4.67$, $p=.028$) were found for confidence diagnosing. Providers were more comfortable diagnosing depression and anxiety than bipolar disorders ((F_{FvsR} (1, 21)=29.84, $p < .001$); (F_{Ryear} (1, 14)=23.79, $p < .001$)). Faculty were more comfortable diagnosing than residents ($F(1, 21)=5.86$, $p=.025$), and 2nd year residents were more comfortable diagnosing than 1st and 3rd years ($F(1, 14)=9.29$, $p=.009$). A main effect of disorder type was found for confidence personally providing therapy ((F_{FvsR} (2, 42)=19.37, $p < .001$); (F_{Ryear} (2, 28)=20.52, $p < .001$)). Providers were significantly more comfortable providing therapy for depression and anxiety than bipolar disorders ((F_{FvsR} (1, 21)=25.56, $p < .001$); (F_{Ryear} (1, 14)=30.84, $p < .001$)).

Providers of all levels of experience express less comfort diagnosing and managing bipolar than depression and anxiety disorders. Thus, behavioral health specialists in primary care practices may be best used as consultants to providers in their management of depression and anxiety, and as direct providers for more challenging bipolar and other mental health concerns.

CUSTOMIZING DEPRESSION CARE FOR PATIENT COMPLEXITY:: AN APPROACH TO EXPAND THE EVIDENCE BASE FOR INTEGRATED PRIMARY CARE

Duncan Campbell, PhD[1], Edmund Chaney, PhD[2], Thomas Waltz, PhD[3], Anayansi Lombardero, PhD[4], Laura Bonner, PhD[5], Barbara F. Simon, MA[6], Bolkan Cory, PhD[7], Kara Zivin, PhD[8], Teri Davis, PhD[6], Alissa R. Simon, MA[9], Lisa V. Rubenstein, MD, MHS[10]

[1]University of Montana, Missoula, MT; [2]VA Puget Sound Health Care System, Bandon, OR; [3]Eastern Michigan University, Ypsilanti, MI; [4]New Mexico VA Health Care System, Albuquerque, NM; [5]VA Puget Sound Healthcare System, Seattle, WA; [6]VA Greater Los Angeles Healthcare System, Los Angeles, CA; [7]Washington State University Vancouver, Vancouver, WA; [8]VA Ann Arbor Healthcare System, Ann Arbor, MI; [9]VA Greater Los Angeles Healthcare System, North Hills, CA; [10]VA Greater Los Angeles Healthcare System, UCLA and RAND, Los Angeles, CA

Objectives: Complex biopsychosocial factors other than depression symptoms can complicate depression care and impact patient outcomes. Yet depression guidelines provide little direction on addressing these factors, particularly in the primary care settings where most depressed patients are detected and treated. We aimed to identify complexity dimensions—or areas of focus beyond depression itself—and strategies for addressing these, while relying on empirical data. We aimed to prioritize complexity dimensions and strategies for incorporation in Veterans Affairs (VA) depression care guidelines through a key stakeholder expert panel.

Methods: We reviewed the relevant literature and products from a multisite longitudinal study of depression among Veterans in primary care to identify complexity dimensions for depression management and to generate clinical management strategies. We identified employment, social support, comorbidity, stigma, patient preferences, faith/spirituality, women Veterans' needs, and ethnicity as key dimensions and identified 50 clinical strategies for addressing them. We convened an expert panel of 13 VA stakeholders with diverse clinical, administrative and research expertise who rated, discussed and re-rated the importance and feasibility of each complexity dimension and strategy. Importance ratings ranged from '1=low' to '7=high'.

Results: Patients' treatment preferences (6.3, SD=.86), social support (6.2, SD=.90), and employment (5.9, SD=.86) were rated as the most important complexity dimensions for accommodation in primary care-based depression treatment. Ratings showed agreement on some strategies for addressing complexity dimensions but uncertainty about others. Expert panelists' commentary provided guidance on implementation barriers and feasibility of specific strategies and reflected a tension between the need to address the dimensions and uncertainty about which specific strategies were feasible and effective for doing so.

Implications: Our VA expert panel identified specific patient complexity dimensions as critical for achieving optimal depression care outcomes in primary care. Consistent with recent work in multimorbidity/patient complexity, our panelists ascribed high importance to incorporating treatment preferences, social support, and employment considerations in depression guidelines. While panelists agreed on some potential management strategies (e.g., educating care managers about the impact of complexity on clinical status) our results suggest an urgent need for further development of standard methods for addressing key complexity dimensions.

ACCEPTANCE AND COMMITMENT THERAPY VS. MEDICAL TREATMENT AS USUAL WAIT-LIST CONTROL GROUP FOR PRIMARY HEADACHES: THE ALGEA STUDY

Maria Karekla, Ph.D., Vasilis Vasileiou, M.A.

University of Cyprus, Nicosia, Nicosia, Cyprus

Headache sufferers commonly use experiential avoidance as a coping mechanism to manage pain or other private events (e.g. thoughts) related to their headache difficulties. However, avoidance of headache triggers or of other headache-related internal experiences are found to instead increase trigger potency, restrict lifestyle, decrease internal locus of control, and exacerbate and maintain pain perception. New treatment approaches, such as Acceptance and Commitment Therapy (ACT; Hayes et al., 2012), emphasize acceptance and valued-living as alternatives to avoidance. Though APA has included ACT as an empirically supported treatment for chronic pain, very little evidence exists as to its effectiveness for head pain. This paper presents the results of a Randomized control trial comparing an ACT-based intervention (added to medical treatment as usual-MTAU) compared to MTAU only control for primary headache. Secondly, it investigates whether the proposed ACT process of change mechanisms (i.e. acceptance and values-based actions) mediate headache interference and treatment outcomes (quality of life). 120 headache sufferers were randomly assigned to either 9 sessions of ACT or to MTAU, and completed questionnaire at three point assessments (pre, post, follow up periods). Results demonstrate significant reductions in headache-related interference, increases in emotional and physical functioning and improvements in quality of life in the ACT group compared to control. Mediation analysis show ACT to work through its proposed mechanisms of action (acceptance, defusion and values consistent living). This study provides new evidence regarding the utility of ACT in the management of primary headaches.

TREATMENT OUTCOMES FOR AN INTERDISCIPLINARY PAIN REHABILITATION PROGRAM: COMPARISON OF OUTCOMES BASED ON OPIOID USE STATUS

Wesley Gilliam, Ph.D., L.P., Eleshia J. Morrison, PhD, L.P., Jeannie Sperry, PhD, ABPP

Mayo Clinic, Rochester, MN

Introduction: Chronic pain is a major public health concern with profound negative effects on the well-being of millions of Americans, and widespread use of prescription opioids for chronic pain has contributed to the escalating problem of opioid use disorder. Medically-directed opioid tapering is increasingly recognized as an unmet need for patients with chronic pain who desire to discontinue long-term opioid therapy. Multidisciplinary pain rehabilitation programs can be highly effective in discontinuing opioids in patients with chronic pain while also improving patients' functional status. This study sought to examine treatment outcomes among two cohorts of patients enrolled in a three-week interdisciplinary pain rehabilitation program: Patients engaged in interdisciplinary pain treatment + physician supervised opioid taper vs. nonopioid users engaged in interdisciplinary treatment.

Methods: Mixed model ANOVAs 2 (Group: opioid use, no opioid use) x 2 (Time: admission, discharge) were used to compare groups on pre- to post-treatment changes on self-report (pain severity, interference, depression, catastrophizing, performance in ADL's) and observer-rated outcomes (aerobic capacity, trunk strength) among 285 treated patients.

Results: All patients in the opioid cohort successfully completed their opioid taper (mean MME = 79). For self-report measures, significant main effects for time were detected for all self-report outcomes (F's > 247.0; p's < .001; n^2 >.46). No significant main effect of opioid use or opioid use x time or interaction effects detected. Similarly, for observer-rated outcomes, significant main effects for time were detected (F's > 124.2; p's < .001; n^2 >.33), while no main effect of opioid use or opioid use x time effects were detected. Self-report treatment gains were maintained at 6 month follow-up (F's >41.4; p's < .001; n^2 >.44). Patients in the opioid cohort also reported significant pre- to post-treatment reduction in opioid craving (F= 20.6; p2 =.16)

Conclusion: Interdisciplinary pain programs that incorporate opioid withdrawal demonstrate significant improvements in functional and psychological sequelae of chronic pain, irrespective of opioid use status. More programs utilizing evidence-based approaches are needed to address this significant public health issue.

CO-MORBID ADDICTION AND PAIN: DEVELOPING A CBT TREATMENT TO ALTER PSYCHO-PHYSIOLOGICAL PAIN RESPONSE

Amy Wachholtz, PhD, MDiv, MS

University of Colorado Denver, Denver, CO

Aims: The purpose of this study is to evaluate STOP (**S**elf-regulation **T**herapy for **O**pioid addiction and **P**ain) a novel rolling-entry group therapy intervention developed directly from a previous study identifying psycho-physiological treatment needs of patients with comorbid pain and opioid addiction. ***Method***: 16 individuals with diagnosed long term chronic pain and opioid addiction (2 + years) on stable doses of methadone or buprenorphine for opioid addiction were recruited from local addiction treatment centers. Participants completed a psychological assessment and a cold water task to assess pain sensitivity at 3 time points pre- post- and at a 3 month followup. Participants completed the 12 session weekly 90-minute group therapy intervention as part of their MMT/Bup treatment agreement with their local treatment centers. Urine toxicology was given weekly. Repeat measure ANOVAs were performed on pain, activity, and illicit drug cravings and use. ***Results***: The study showed high feasibility and acceptability among patients with an 80% attendance rate. There was no illicit drug use, as confirmed by urine toxicology and self-report, after week 8. Pain tolerance (seconds) to a laboratory pain trigger significantly improved from Pre (M=38.3, SD=7.10) to 3 month follow up which approached the national average (M=123.5, SE=11.09; p*Conclusion*: STOP, a novel 12-week, rolling entry group therapy based on the results of a psychophysiological needs assessment of individuals with co-morbid pain and opioid addiction, has early evidence of high feasibility, acceptability, and effectiveness. Focusing on improving pain self-efficacy may be a key to successful treatment for patients with comorbid pain and opioid addiction. Future research should examine if substance abuse clinicians without experience in pain can be taught to use STOP in a community treatment setting.

A PATIENT DECISION AID TO REDUCE DEMAND FOR OPIOIDS

Andrea Gielen, ScD ScM

Johns Hopkins Bloomberg School of Public Health, Baltimore, MD

Background We developed a patient decision aid (PDA), a web-based, patient-centered educational intervention that helps patients have an informed discussion about pain medication with their ED provider. We hypothesized that better informed patients would be less likely to prefer an opioid pain reliever (OPR). This presentation will describe the formative research used to develop the PDA, the content of the PDA, and the RCT pilot test protocol for the two test sites (Maryland, West Virginia) with preliminary results.

Methods. In-depth interviews were conducted with 13 ED clinicians, 6 nationally recognized pain experts, and 17 recently discharged patients. Interviews were transcribed and coded for analysis. Two rounds of beta testing of the PDA were conducted with 10 ED patients. For the pilot test, 144 participants are recruited in the ED waiting rooms.

Results Clinicians uniformly expressed the belief that an OPR PDA could be useful as a patient centered educational tool and a supplement to their treatment planning. Patients reported receiving little to no information on OPRs during their most recent ED visit, and they would have liked more information. Beta test participants thought the tool was useful and would be appreciated by patients waiting to be seen. They provided suggestions, which we addressed through improving the readability of the printed information and the graphics. The pilot testing protocol involves random assignment of eligible patients (adult, chief complaint of pain, acute injury, pain score 7-10, no current use of OPR, English-speaking) to complete the PDA or a health risk assessment (HRA), both completed on a tablet prior to seeing the treating provider. The PDA provides tailored feedback for use by the patient and provider. Measures taken before and after interacting with the PDA/HRA, after the ED visit, and 6 weeks later include: decisional conflict; knowledge; pain management preference; pain scores; patient satisfaction; and use, storage, and disposal of medication if prescribed an OPR. The trial will run from September, 2016-December, 2016, with outcome data available at the conference.

Conclusions Creating a patient-centered decision aid benefits from formative research. Computer technology can efficiently provide tailored patient education, which should facilitate shared decision making for pain management.

INTRODUCTION TO PROGRESSIVE MUSCLE RELAXATION THERAPY FOR MIGRAINE IN THE EMERGENCY DEPARTMENT: A PILOT FEASIBILITY STUDY

Mia Minen, MD, MPH[1], Alexandra Boubour, N/A[2], Scott W. Powers, PhD[3]

[1]NYU Langone Medical Center, New York, NY; [2]Barnard College of Columbia University, New York, NY; [3]Cincinnati Children's Hospital and University of Cincinnati College of Medicine, Cincinnati, OH

Background: There are 5 million visits to US emergency departments (ED)/year for migraine/headache. Though many of these patients would benefit from behavioral or pharmacologic preventive therapy these teachable moments are usually lost. Herein we assess whether ED patients with migraine would agree to progressive muscle relaxation (PMR), a proven therapy amenable to introduction in the ED and independent practice at home. **Objective**: We sought to examine whether migraine patients would agree to try PMR while in the ED, and for how long they would engage in an introductory session. **Methods**: Research assistants in our urban academic ED introduced the study concept to eligible migraine patients in the ED. Patients completed a survey about their headache history and were asked to listen to a 20-minute audio recording of PMR. **Results**: We approached 11 patients and 8 agreed to participate (73%). Mean age of participants was 35.5 (13.17) years and 63% were female. Headaches occurred on 10.7 days/month on average and were usually severe (63%) or moderate (25%). No one had previously done PMR though two had previously tried biofeedback. All had previously visited an ED for their headaches; mean number of prior ED visits was 2.38 (range 1-5). Half had seen a neurologist for treatment of their headaches. One person did not do the PMR session in the ED. Of the remaining seven who did the PMR, the mean time spent doing it was 7.6 minutes (range 1-20). **Conclusions**: Migraine patients presenting to the ED have severe and frequent migraines which make them candidates for preventive behavioral treatments. PMR is a behavioral technique which can be introduced in the ED setting. Follow-up studies should examine whether patients will continue to use these behavioral techniques at home.

DETERMINANTS OF PARTNER SUPPORT FOR PHYSICAL ACTIVITY: A COUPLES-FOCUSED ANALYSIS AMONG OLDER ADULTS WITH OSTEOARTHRITIS

Heather Wasser, PhD MPH RDN IBCLC[1], Christine Rini, PhD[2]

[1]University of North Carolina, Chapel Hill, NC; [2]University of North Carolina at Chapel Hill, Chapel Hill, NC

Objective: Physical activity (PA) can decrease pain and improve function among older adults with osteoarthritis (OA), yet most people with OA are insufficiently active. While partner support for PA is one of the most robust predictors of PA, research on the determinants of partner support is limited. Using data from the Partners in Active Living Study (PALS), we aimed to identify individual and household characteristics associated with the quantity of positive and negative partner support for PA. **Methods**: Data are from baseline surveys of main participants (mains) and support partners (partners) participating in PALS, a 12-month longitudinal dyadic study of 170 couples in central North Carolina. Inclusion criteria for mains include self-report of OA, ability to walk unaided, insufficient levels of PA (< 120 minutes of PA/week), and marital or cohabiting status with a partner who is willing to participate. Partners may or may not have osteoarthritis. Dependent variables are amount of positive and negative enacted support for PA, dichotomized into high versus low using a median split. Independent variables are individual and household characteristics and a global score for the quality (effectiveness) of enacted support. Bivariate and multivariable models were fit using logistic regression. Statistical significance was set at $P < .05$. **Results**: Mains and partners were of similar age (~65±9 years) race/ethnicity (~80% Non-Hispanic white), and education (~55% >4y college). Mains were significantly more likely than partners to be female (64.71% versus 36.47%, $P<.001$*).* In bivariate analyses, support effectiveness, the partner being female, and the main being female were significantly associated with positive enacted support for PA (odds ratio [OR]=3.80, [95% confidence interval (CI): 2.00-7.19]), OR=2.91, 95% CI: 1.51-5.58, and OR=0.38, 95% CI: 0.20-0.73, respectively). These associations remained significant in multivariable analyses. Partner stiffness and greater depression levels in couples were significantly associated with negative enacted support for PA in bivariate analyses (OR=1.90, 95% CI: 1.03-3.52 and OR=2.48, 95% CI: 1.04-5.89, respectively), but became nonsignificant in adjusted models. **Conclusion**: Identifying determinants of enacted social support, a consistent predictor of PA, is important information for the targeting and tailoring of behavioral interventions. Our findings demonstrate the importance of the quality (effectiveness) of support provided and suggests women and men may differ in their ability to provide positive support for PA, with men potentially needing more guidance. Future research among larger, more demographically diverse samples is warranted.

DIFFERENCES AMONG US: UNDERSTANDING THE IMPACT OF BEHAVIORAL VARIATION ON COACHING ENGAGEMENT

Anne Wallace, PhD[1], Matt Bogard, M.S.[2], Varun Kukreja, MBA[3], Susan M. Zbikowski, PhD[4]

[1]Humana, Cincinnati, OH; [2]Humana, Woodburn, KY; [3]Humana, Irving, TX; [4]Humana, Seattle, WA

BACKGROUND: Health coaching is a key intervention in combatting the prevalence of lifestyle-driven conditions. Little research, however, has examined differences in how people progress through such programs. The current purpose was to examine whether individuals with different behavioral profiles (based on demographic and health-related behaviors), differ regarding their activity and outcomes in a coaching program.

METHOD: Humana created the behavioral profiles to improve how it engages and intervenes with members in clinical and wellness services. Exploratory analyses of participants enrolled in health coaching between2012-2016 indicated 4 of 8 total behavioral profiles had different levels of participation than the total population. These analyses examined the first 60 days of coaching for the 4 segments (N=3761) – Overwhelmed Guidance Seeker (OGS), Participating Realist (PR), Selfless Support Seeker (SSS), and Simply Compliant (SC). Significance tests by behavioral profile in number/type of interactions, number of goals set/complete, and biometric outcomes were conducted, as well as survival analyses of probability/time to goal completion.

RESULTS: Behavioral segments varied significantly by modality: SC were more likely to work online than PR ($p < 0.001$) and SSS ($p < 0.05$); PR more likely to use telephonic/online mix than OGS ($p < 0.01$) or SC ($p < 0.0002$). SSS were less likely to interact with a coach than other profiles (ps < 0.05). The PR and OGS segments set ($p < 0.001$) and completed ($p < 0.0001$) more goals than SC and SSS segments. Survival analysis indicated PR had higher probability of goal completion/shorter time to completion than other segments; OGS had higher probability of goal completion/shorter time to completion than SSS or SC (ps < 0.002). Participants in coaching most commonly work on managing weight; analyses of weight loss by segment revealed no group differences ($p=0.579$).

DISCUSSION: Understanding how different behavioral profiles respond to coaching enables practitioners to implement tailored approaches that better support participation and progress among individuals in groups (Selfless Support Seekers and Simply Compliant), who tend to

participate less and achieve fewer goals. Next steps are to test which tailored interventions are most effective.

DISMANTLING THE THEORY OF PLANNED BEHAVIOR: EVALUATING CHANGE IN ATTITUDES, NORMS, AND PERCEIVED BEHAVIORAL CONTROL

Erika Montanaro, PhD

University of North Carolina Charlotte, Charlotte, NC

Background: It is still largely unknown which theoretical constructs in a particular theory (e.g., the Theory of Planned Behavior) are the active ingredients of change. The lack of a solid understanding of how key theoretical constructs interact to motivate behavior change may be partly to blame. ***Purpose:*** The current study examines the utility of each of the hypothesized determinants of behavior in the Theory of Planned Behavior (i.e., attitudes, norms, perceived behavioral control, and intentions) and explores the optimal combination (single construct interventions vs. three constructs vs. four) of these constructs in an intervention to increase condom use intentions and behavior among college students. ***Methods:*** 317 participants (M_{age} = 19.31; SD_{age} = 1.31; 53.3% female; 74.1% Caucasian) were randomly assigned to one of seven computer-based interventions. Interventions were designed using the Theory of Planned Behavior as the guiding theoretical framework. 196 (61.8%) completed behavioral follow-up assessments three-months later. ***Results:*** In a meditational model, we found that the four construct intervention was marginally better at changing intentions (estimate = -.06, *SE* = .03, *p* = .06), but the single construct interventions were related to risky sexual behavior at follow-up (estimate = .04, *SE* = .02, *p* = .05). ***Conclusions:*** This study suggests that many of the constructs manipulated here are conceptually and empirically interconnected. Perhaps these constructs synergistically work together in order to produce change. Further research is necessary to develop the optimal combination of constructs in the Theory of Planned Behavior and their ordering of presentation in intervention materials. (ClinicalTrials.gov number NCT# 02855489).

EFFECTS OF CONTEXTUALLY-TAILORED SUGGESTIONS FOR PHYSICAL ACTIVITY: THE HEARTSTEPS MICRO-RANDOMIZED TRIAL

Predrag Klasnja, PhD[1], Shawna N. Smith, PhD[1], Nicholas J. Seewald, MS[1], Andy Jinseok Lee, B.S.E[2], Kelly Hall, N/A[1], Susan A. Murphy, Ph.D.[1]

Effects of contextually-tailored suggestions for physical activity: The HeartSteps micro-randomized trial

Predrag Klasnja, Shawna Smith, Nicholas Seewald, Andy Lee, Kelly Hall, Susan A. Murphy

University of Michigan

Often the easiest way to increase physical activity is by walking more. Yet, opportunities for walking vary throughout the day, by contexts like location, weather and busyness. Increasingly, mHealth technologies can sense such context and deliver behavior-change interventions at moments of opportunity or risk. HeartSteps is an Android application that delivers contextually-tailored activity suggestions to help individuals walk more. HeartSteps contains a library of over 500 suggestions, each tagged with a set of contexts indicating appropriate suggestion use. Suggestions are delivered up to five times a day (decision times)—morning commute, lunch, mid-afternoon, evening commute, and after dinner—and are tailored to user location (work, home, other), time of day, weather, and weekday/weekend. HeartSteps includes two types of suggestions: suggestions for walking or for disrupting sedentary behavior. We evaluated HeartSteps in a 6-week micro-randomized trial with 37 sedentary adults. Each participant was randomized with .6 probability to receive a suggestion at each of the five decision times each day; if a suggestion was provided, a second equal randomization determined whether to send a walking or sedentary suggestion. We assessed if providing a suggestion impacts participants' step count in the 30 minutes following randomization, and if that effect changes over time. GEE models estimated the effect of delivering a suggestion on 30-min step count (logged) post-randomization, controlling for 30-minute step count prior to randomization (logged). Results: Averaging over study days and suggestion type, the effect of providing a suggestion was positive and marginally significant (e^b=1.14 p = .059, a 14% 30-min step count increase). Separating

suggestion types showed a significant effect for walking suggestions, increasing 30-min step count by 24% ($p=.02$) on average, but not for sedentary suggestions. For an individual with the mean 30-minute step count of 253 steps, this equates to 61 extra steps in the 30 minutes post-randomization. When an interaction with time is added, suggestions show a large initial effect ($e^b=1.66$, $p < .01$), a 66% increase in 30-minute step count on average, that diminishes over time ($e^b=.98$, $p < .01$). This effect is also driven by walking suggestions.

EFFECTS OF PHYSICAL ACTIVITY GOAL ATTAINMENT ON ENGAGEMENT AND OUTCOMES IN THE NATIONAL DIABETES PREVENTION PROGRAM

Natalie Ritchie, PhD[1], Jodi Holtrop, PhD[2], Havranek Edward, MD[3], Jennifer Carroll, MD MPH[4]

[1]Denver Health, denver, CO; [2]University of Colorado School of Medicine, Aurora, CO; [3]Denver Health, Denver, CO; [4]University of Colorado Department of Family Medicine, Aurora, CO

The National Diabetes Prevention Program (DPP) is a widely-disseminated, evidence-based intervention to prevent or delay diabetes onset. Greater engagement in the yearlong program is expected to yield better outcomes, but high attrition is a major concern and improved retention strategies are needed. The National DPP curriculum, published by the Centers for Disease Control and Prevention, is highly prescriptive for weight loss including through a weekly goal of 150 or more minutes of physical activity. However, previous evidence suggests it may be overly challenging and unnecessary to require a high threshold of physical activity. We assessed the effects of failing to achieve prescribed physical activity goals on outcomes in the National DPP. We included 406 participants who attended the National DPP at a large healthcare organization. Participants reported not meeting physical activity goals about half of the time on average. Across all participants, each occurrence of goal failure predicted a 25% lower likelihood of attending the next session (OR 0.75; $P < .001$; 95% CI 0.64-0.87). In adjusted models, there was an inverse relationship between the frequency of failure to achieve physical activity goals and attendance, $\beta = -0.21$ ($p < .01$), and a positive linear relationship with weight gain, $\beta = 0.14$ ($p < .05$). Similarly, there was an inverse relationship between failing to meet physical activity goals and completing the program (OR 0.47; $P < .05$; 95% CI 0.24-.90) and obtaining at least five percent weight loss (OR 0.39; $P < .01$; 95% CI 0.19-0.76). In contrast, there was no significant effect of not meeting physical activity goals on the amount of weight change per session attended. Findings suggest the experience of goal failure may be a deterrent to retention in the National DPP, yet the program was equally efficacious in terms of weight loss per session attended regardless of meeting physical activity goals. Results are not fully generalizable as this was an observational study with no control group. Implications are to consider adopting a more patient-centered, individualized approach to setting physical activity goals in the National DPP.

EXAMINING THE BEHAVIORAL MEDICINE STANDARD OF CARE FOR ETOH CONSULTATIONS WITHIN TRAUMA DEPARTMENT

Kelly Lynn. Gilrain, PhD[1], Alexa Hays, BA[1], Stephanie Goldstein, MS[1], William M. Skelton, BA, MS, MA[1], Lisa Capano-Wehrle, BS, MPH[1], Jennifer Petrongolo, MSW, MA[2], Steven Ross, MD, FACS, FCCM[1], Cori E. McMahon, PsyD[3]

[1]Cooper University Hospital, Camden, NJ; [2]La Salle University, Lancaster, PA; [3]Cooper University Hospital/ MD Anderson Cancer Center at Cooper, Camden, NJ

The ACOS and Committee on Trauma require patients admitted to a trauma service with elevated Blood Alcohol Concentration (BAC) be seen for brief ETOH screening and intervention. Research indicates there is no current standard of care (SOC) across hospitals. At Cooper University Hospital (CUH), the Behavioral Medicine Consultation-Liaison (CL) service has completed screens and interventions since 2014. A protocol at CUH was created based upon the Screening, Brief Intervention and Referral of Treatment (SBIRT), which provides only recommendations for screening and intervention. At CUH, the Alcohol Use Disorders Identification Test (AUDIT) is used to assess alcohol use/abuse. Psychosocial stressors, acute trauma symptoms and stage of change are also assessed. Intervention focuses on psychoeducation, the effects of alcohol use, and includes brief MI to determine desire for behavior change. Treatment resources are provided to interested patients. The AUDIT is repeated post-discharge. The current study aims to provide retrospective rationale for effectiveness of CUH's SOC. Trauma patients (n = 289, 76.5% male, 56.4% White, mean age = 45) with elevated BAC (M = 178.96) were referred as part of the SOC. Of those, 287 patients completed the intervention and 37 (12.8 %) followed-up post discharge. Baseline AUDIT scores were significantly related to ETOH levels on admission (r = .19, p < .01). A paired samples t-test indicated that those who completed SBIRT significantly reduced AUDIT scores at follow-up (t (38) = 3.34, p < .01). A repeated measures ANOVA was conducted to compare main effects of time and baseline ETOH and interaction effect of time and baseline ETOH on AUDIT scores. Results revealed main effect of time (F (1, 33) = 14.24, p < .01) and baseline ETOH (F (1, 33) = 11.11, p < .01). A trend-level interaction effect was observed in which higher BAC on admission led to steeper improvements at follow-up (F (1, 33) = 2.12, p = .15). At follow-up, 21.1% reported seeking treatment for alcohol and 71.1% reported modifying drinking behavior. Eleven patients reported hospitalizations since intervention, 2 were alcohol-related. A positive reduction in alcohol symptoms was found, which may decrease future hospitalizations related to alcohol use. Results provide sufficient rationale to continue this SOC and to consider it for implementation at other hospitals. Modifications may include

strategies to increase follow-up, such as establishing a specific timeline for post-assessments and collecting multiple types of contact information for patients at screening. Additional data is anticipated and will be included in future analyses.

EXERCISE MAY ENHANCE SMOKING CESSATION THROUGH IMPROVED SLEEP

Shira Dunsiger, PhD[1], Beth C. Bock, PhD[2], Jessica Whiteley, PhD[3], Joseph T. Ciccolo, PhD[4], Ernestine Jennings, PhD[5], Sarah Linke, PhD, MPH[6], Rochelle K. Rosen, PhD[7], Santina Horowitz, BS[8], Ryan Lantini, MA[9], Bess H. Marcus, Ph.D.[10]

[1]The Miriam Hospital and Brown University, Portsmouth, RI; [2]Brown Medical School, Providence, RI; [3]UMass Boston, Boston, MA; [4]Teachers College, Columbia University, New York, NY; [5]The Miriam Hospital/ Alpert Medical School, Providence, RI; [6]UC San Diego, La Jolla, CA; [7]Brown University School of Public Health, Providence, RI; [8]The Miriam Hospital, Newport, RI; [9]The Miriam Hospital, Providence, RI; [10]University of California, San Diego, La Jolla, CA

The present study examined data from 166 women in the exercise arm of a randomized controlled community-based exercise and smoking cessation trial. Female smokers (N=330, M_{age}=44.1[SD=9.9], M=17.4 cig/day[SD=8]) were randomly assigned to a 12-week cognitive-behavioral smoking cessation program plus either exercise or contact control. Dose of exercise was defined as total days over 12 weeks of reported aerobic and/or resistance exercise. Previous analyses have shown a dose-response relationship between exercise dose and 7-day point prevalence abstinence (PPA) at 12 weeks. Using a series of generalized models, we tested the association between exercise dose and sleep as measured by the Insomnia Severity Index over the 12-week treatment. Logistic regression was used to test associations between bio-verified 7-day PPA and changes in sleep over 12 weeks as well as the associations between patterns of quitting behavior and changes in sleep. Patterns have previously been identified using Latent class models, suggesting five distinct patterns of quitting behavior: those who made few quit attempts, non-quitters, early attempters, late attempters (quit at 12 weeks but didn't attempt until late) and quitters, with exercise participants reporting a significantly greater proportion of late attempters than controls. Results of the present study show significant associations between greater exercise dose and better quality of sleep at 12 weeks controlling for baseline (b=-0.14, SE=0.07, $p < .05$). Exercise dose was also significantly negatively associated with difficulty falling asleep (b=-0.03, SE=0.01, p=0.04) and satisfaction with sleep (b=-0.03, SE=0.02, p=0.04) at 12 weeks. The odds of bio-verified 7-day PPA at 12 weeks was significantly higher for those reporting better sleep at 12 weeks (OR=0.73, p=.04), and a trend for higher odds of quitting for those whose sleep scores improved from baseline to 12 weeks emerged (OR= 1.78, p=0.09). Finally, non-quitters had more difficulty falling asleep compared to quitters, and late attempters had worsening sleep scores over 12 weeks compared to quitters (p's < .05).The association between exercise

and quitting seen in our prior study may be related to improved sleep. Additional mediational analyses will explore whether improved sleep may be a mechanism underlying the efficacy of exercise for helping smokers quit.

EXPLORING MODERATORS OF THE RELATIONSHIP BETWEEN EXERCISE AND ALCOHOL USE

Alena Kryvanos, A.A[1], Bethany R. Shorey Fennell, B.S.[1], Renee E. Magnan, PhD[2]

[1]Washington State Univeristy Vancouver, Vancouver, WA; [2]Washington State University Vancouver, Vancouver, WA

Exercise has been proposed as an adjunct to alcohol prevention and treatment efforts, yet research typically supports a positive correlation between alcohol use and exercise. This relationship is not well understood and one specific area needing more focus is for whom this relationship may be more or less pronounced. The current investigation explored demographic, personality, motivational, and behavioral moderators of the relationship between exercise and alcohol. In a cross-sectional investigation, participants (N=122) provided assessments of alcohol use and exercise over the past three months. Variables tested as moderators included age, sex (demographic), positive and negative urgency, positive and negative affect (personality), alcohol dependence and drug use (behavioral), and motivation to use exercise as a compensatory behavior (motivational). Alcohol use and exercise over the past three months were positively correlated ($r = .23$, $p = .01$). A series of hierarchical regressions tested the main effects of exercise, the proposed moderator variable in Step 1, and the exercise x moderator interaction term in Step 2 on alcohol use. With the exception of positive affect, all proposed moderator variables were associated with alcohol use. However, only drug use ($\beta=.20$, $p=.03$) and compensatory motivation ($\beta =-.15$, $p = .08$) moderated the exercise-alcohol use relationship. Those who engaged in greater exercise and drug use reported greater alcohol use. Those who engaged in less exercise and had lower compensatory were less likely to consume alcohol. Although replication and extension of these findings are needed, they do provide some insight into factors that could contribute to the exercise-alcohol use relationship. Specifically, previous drug use and compensatory motivation could be important factors to take into consideration when designing interventions focused on alcohol reduction or problem-drinking prevention with exercise as an adjunct.

EXPLORING THE EFFECT OF LONGSTANDING ACADEMIC-COMMUNITY PARTNERSHIPS ON STUDY OUTCOMES:A CASE STUDY

Annette E. Maxwell, DrPH, Catherine M. Crespi, PhD, Roshan Bastani, PhD

University of California Los Angeles, Los Angeles, CA

Background: We conducted two large trials (CRC1 & CRC2) to promote colorectal cancer (CRC) screening among Filipino Americans. By design, about half of the organizations that participated in CRC2 had also participated in CRC1. While sustained academic-community partnerships can improve working relationships between research partners, they could also influence study outcomes, thereby impacting the generalizability of study findings. We explored the effect of being a new versus a previous research partner on CRC2 study outcomes.

Methods: CRC2 tested two strategies (basic and enhanced) for implementing an evidence-based multi-component intervention to promote CRC screening at community organizations (N=17) with the help of trained community health advisors (CHAs; N=63). In both the basic and enhanced arms, CHAs recruited Filipino Americans (N=673) who were not adherent to CRC screening guidelines. The main study outcome was CRC screening status of participants at 6-month follow-up. Previous versus new served as a stratification variable for randomization of organizations. Using multilevel logistic regression, we obtained estimates of the odds ratio (OR) for new versus previous partner controlling for several organizational characteristics (study arm, faith-based versus social service organization, years in operation) and further controlling for CHA and participant characteristics.

Results: Screening rates were substantially higher among participants of previous versus new partner organizations in unadjusted analysis (68% versus 45%, OR 2.5, p=.21), after adjusting only for variables at the organization level (73% versus 34%, OR 7.3, p=.01) and after additionally adding CHA and participant level factors to the model (70% versus 40%, OR 4.8, p=.10). Although power was low due to the limited number of organizations, absolute differences in screening rates were large and consistent.

Discussion: These findings suggest that study outcomes that are achieved with long-term community partners may not be generalizable to new partners. Inclusion of organizations that do *not* have an ongoing research relationship with an academic partner may improve external validity of trials in community settings.

FAMILY-BASED LAY HEALTH WORKER INTERVENTION PROMOTES HEALTHY NUTRITION AND PHYSICAL ACTIVITY IN VIETNAMESE AMERICANS: A RCT

Janice Y. Tsoh, PhD[1], Tung T. Nguyen, MD[1], Nancy Burke, PhD[2], Ginny Gildengorin, PhD[1], Jin Kim, PhD[1], Khanh Le, MD, MPH[1], Ching Wong, BS[1], Bang H. Nguyen, DrPH[3], Stephen J. McPhee, MD[1]

[1]University of California San Francisco, San Francisco, CA; [2]University of California, Merced, Merced, CA; [3]University of California San Francisco, Richmond, CA

Background: Many Asian Americans do not meet nutrition and physical activity (NPA) recommendations, which increases their vulnerabilities to chronic diseases. A majority of Vietnamese Americans, the 4th largest Asian American group, are foreign-born with limited English proficiency. This study reports outcomes of a randomized controlled trial of a family-based lay health worker (LHW) intervention in promoting healthy NPA among Vietnamese Americans.

Methods: Participants were 107 dyads of Vietnamese male cigarette smokers and non-smoking family members (total N = 214) who were randomized to one of the two groups: the NPA intervention (n=106 or 53 dyads) or smoking cessation control (n=108 or 54 dyads). All participants received 2 LHW-led small group sessions and 2 individual telephone calls on their assigned topic within 6-8 weeks. Participants were assessed at baseline and 6-month follow-up. Multivariable logistic regression models were used to compare between the study arms on the changes in knowledge of USDA's MyPlate and CDC's physical activity (PA) recommendations, self-reported vegetable/fruit intake and PA, and changes in body weight from baseline to 6-month.

Results: The 214 participants included 107 male daily smokers and 107 family members (92.5% female) with mean age = 55.0 years (range: 19-86), 93.4% spoke limited English, and 60.7% with BMI >23 (overweight or obese using recommended cut-off for Asians). At baseline, a minority knew about MyPlate (29.0%) or PA recommendations (5.1%) or met the recommended vegetable/fruit intake (39.3%) or PA level (41.6%). At 6-month, the NPA group reported a greater increase in knowing MyPlate (NPA: 20.9% vs. control: 5.5% increase, p=0.003) and PA recommendations (NPA: 28.3% vs. control: 0% increase, p < 0.001) as well as meeting recommended vegetable/fruit intake (NPA: 39.3% vs. control: 10.6% increase, p < 0.001) and PA level (NPA: 12.3% vs. control: 2.8% increase, p=0.006). In multivariable models, baseline BMI was not associated with any of the outcome measures. The NPA group was more

likely to know MyPlate (adjusted odds ratio [AOR] = 2.9; 95% CI: 1.6 – 5.3) or PA recommendations (AOR: 8.0; 95% CI: 3.0 – 21.2). Although they were not more likely to meet PA recommendation (p=0.09), the NPA group were more likely to meet vegetable/fruit intake recommendation (AOR = 4.5; 95% CI: 2.2 – 9.1) and have had weight loss of 5 lbs. or more (AOR: 1.8, 95% CI: 1.2 – 2.6) than the control group.

Conclusions: Family-based LHW outreach delivering NPA information was effective in increasing NPA knowledge, self-reported vegetable/fruit intake and weight loss in Vietnamese Americans. Findings underscore the continuing needs to promote NPA knowledge and behaviors in Vietnamese Americans with limited English proficiency and the promise of involving families and peers in addressing such needs.

FEMININE HYGIENE PRODUCTS: ATTITUDES AND BELIEFS ABOUT SAFETY

Pragya Rai, MS, Drishti R. Shah, MS, B.Pharm, Kimberly M. Kelly, PhD, MS

West Virginia University, Morgantown, WV

Objective Despite being used by women all over the world for 80% of their lifetime, limited research on the use and safety of various feminine hygiene products persists, particularly among men. Our objectives were to assess 1) use (women) and awareness (men) of feminine hygiene products, 2) differences in safety attitudes and norms between men and women, and 3) association of practice with safety attitudes and norms of these products in women.

Methods A cross-sectional, online survey was conducted among young adults 18 to 30 years old. The Theory of Planned Behavior guided survey development. T-tests compared differences in attitudes and norms between men and women. Associations between current use of feminine hygiene products (tampons, maxi-pads) with safety attitudes and norms were estimated using logistic regression.

Results Our sample (n=179) included men (n=43), was highly educated (>bachelor's degree= 59%), employed (75%), had an annual family income of >$50,000 (58%), and resided in an Appalachia county (82%). Common products used by women included tampons (82%), panty liners (59%), and maxi pads (54%). Unconventional products used included menstrual cups (8%) and sanitary panties (4%). More controversial products such as feminine wipes (22%) and douches (3%) were also used. Some men were unaware of common feminine hygiene products: tampons (21%), maxi pads (26%), panty liners (51%), douches (40%) and feminine wipes (54%), as well as unconventional products: menstrual cups (79%) and sanitary panties (71%). There was a trend such that women had more positive safety attitudes (p=0.06) and norms (p=0.10) all products than men. Most women had high safety attitudes about tampons (mean=2.77, SD=0.67) and maxi-pads (mean=2.8; SD=0.67). Women using tampons were less likely to be Hispanic (p=0.01), more likely to be White (p=0.003), and had positive safety attitudes (p=0.03) as compared to non-users. Women using maxi-pads were more likely to have an annual family income of

Conclusion Our novel study included men while studying products used by women. Despite being widely advertised and sold in markets, some men were unaware of common feminine hygiene products. Safety attitudes guide selection of feminine hygiene products. Additional research and education is needed about the actual safety of these products to help women in feminine hygiene decision-making.

Gender Differences in Peer Support in Type 2 Diabetes Self-Management: An International Qualitative Study

Florence Okoro, PhD,[1] Debra Barksdale, PhD,[2] Shawn Kneipp, PhD,[3] Kathleen Knafl, PhD,[3] Jennifer Leeman, DrPH, [3] Edwin Fisher, PhD, [3]

[1]University of North Carolina at Charlotte, [2]Virginia Common Wealth University, Richmond Virginia, [3]University of North Carolina Chapel Hill

Background: The effectiveness of peer support programs as a means to sustain self-management in patients with type 2 diabetes has been well-documented. However little is known of how gender differences in peer support might influence the provision and receipt of support.

Purpose: This study used the key functions of peer support as framework to explore gender differences in peer support programs and identified gender-related issues and global cultural contexts that influence peer support.

Method: Qualitative data were generated through telephone interviews using open-ended questions to nine programs across the globe: Africa (Cameroon and Uganda), Asia (Cambodia, Hong Kong, Thailand, and Vietnam), and the United States (Alabama, California, and Illinois). Qualitative content analysis was done to achieve in-depth exploration of categories.

Results: Five themes emerged: 1) Differences in emotional support: female peer supporters reportedly displayed more emotional support than any other form of support; 2) Differences in instrumental support: male peer supporters gave information as their primary form of support; 3) Who is a peer supporter: males dominated as peer supporters in two Asian countries (Cambodia and Hong Kong) and females dominated in African American and Latino peer support programs in the US; 4) Matching by gender: male peer supporters were assigned only male recipients, but female peer supporters could be assigned to either sex; 5) Gender differences in participant availability: there was considerable variety in how gender was manifest in programs and both peer supporters' and participants' responses to them.

Conclusion: This study provided evidence that substantial gender differences and gender-related issues were present in all the peer support programs and that the manifestation of differences varied considerably across settings and cultures. Gender differences have to be taken into consideration when planning peer support programs.

MERITORIOUS AWARD WINNER

GET ACTIVE! EFFICACY OF A BRIEF ACCEPTANCE-BASED BEHAVIORAL INTERVENTION TO PROMOTE EXERCISE ADOPTION AND MAINTENANCE

Courtney J. Stevens, MA[1], Angela D. Bryan, PhD[2]

[1]Alpert Medical School of Brown University, Providence, RI; [2]University of Colorado Boulder, Boulder, CO

Regular exercise confers tremendous transdiagnostic benefits for health, yet 54% of American women are insufficiently active. Affective/experiential factors influence exercise adoption and maintenance, but how best to address these constructs and maximize health outcomes is not well understood. This study proposed that participants may be able to learn acceptance-based skills for managing inherent/inevitable exercise discomfort. The central aims of this investigation were to (1) compare exercise change across time and condition, and (2) assess mechanisms of exercise behavior change over time. A sample of $N = 119$ insufficiently active women aged 21 – 65 were randomly assigned to 1 of the 3 conditions: (1) acceptance-based health coaching (ACT), (2) education-based health coaching (EDUC), or (3) no-health coaching control (CTRL). The study was divided into: Phase 1 Adoption (baseline visit – post intervention), and Phase 2 Maintenance (3- and 6- months follow up). During Phase 1, all participants completed a 30-day exercise program, and ACT and EDUC participants received visit 1 and 2 workshops. All participants were contacted at 3- and 6-months post-intervention to complete follow-up assessments. The overall trend across Phases 1 and 2 was for ACT participants to score highest on exercise outcomes. Notably, a time X condition interaction for PAR total minutes of exercise was observed such that ACT participants completed more exercise minutes in the past week at visit 2 compared to EDUC and CTRL participants, $F(2,103) = 4.58$, $p = .012$, $\eta^2 = .082$. Additionally, only ACT participants completed 150-minutes of exercise per week, on average, over the course of the 30-day intervention (as recorded *objectively* by HR monitors). Repeated measures tests showed significant main effects of time on exercise scores through Phase 2, $F(3, 201) = 22.99$, $p < .001$, $\eta^2 = .255$; but not significant main effects of condition or time X condition interactions. Regarding mechanisms of action, assignment to ACT predicted higher experiential acceptance scores at visit 2, and visit 2 experiential acceptance scores predicted exercise scores at both 3- and 6-months follow-up as tested via mediational analyses. These results demonstrate that a brief acceptance-based intervention can improve metrics of psychological flexibility, which in turn influences exercise

behavior maintenance. Future work should assess the optimal intervention “dose” for bolstering these associations across time.

HOW PEER MENTORSHIP CONVERSATIONS SUPPORT PEOPLE WITH SCI: A THEMATIC ANALYSIS

Rhyann McKay, Bachelor of Human Kinetics[1], Emily E. Giroux, Bachelor of Science Kinesiology[1], Christopher B. McBride, PhD[2], Sheila Casemore, BASc[3], Teren Clarke, Bachelor of Nursing, Master of Management [4], Kristy L. Baxter, Human Kinetics[1], Shane N. Sweet, PhD[5], Heather Gainforth, PhD[6]

[1]University of British Columbia Okanagan, Kelowna, BC, Canada; [2]Spinal Cord Injury BC, Vancouver, BC, Canada; [3]Spinal Cord Injury Ontario, Toronto, ON, Canada; [4]Spinal Cord Injury Alberta, Edmonton, AB, Canada; [5]McGill University, Montreal, PQ, Canada; [6]University of British Columbia, Kelowna, BC, Canada

Background: Participation is defined as the extent and nature of a person's involvement in society. Full participation in society is a U.N. human right. People with a spinal cord injury (SCI) often have lower levels of participation compared to the general population. Peer mentorship is an approach that shows promise for improving participation among people with SCI. Peer mentors can be defined as individuals with lived experience of SCI who provide knowledge, counsel, and encouragement to mentees with SCI. To date, research has not examined how SCI peer mentorship conversations enhance participation among mentees with SCI, or the nature of the topics discussed during these conversations.

Purpose: The purpose of this study is to gain an understanding of how peer mentorship conversations enhance participation among mentees with SCI. Specifically, it aims to use thematic analysis to understand topics discussed during SCI mentorship conversations.

Methods: Three provincial SCI community organizations in Canada recruited participants with SCI. Participants completed a baseline survey to collect information about demographics and prior experience with peer mentorship. Peer mentors and mentees were matched, and their telephone conversations were audio recorded and transcribed verbatim. Two researchers inductively coded each transcript independently to identify topics. The researchers then came together to reach a consensus of the key themes.

Results: Similar to previous analyses of behavioural support conversations, 5 conversations between 5 mentors and 5 mentees were recorded (mean age: 49.2 ± 14.3 years, 40% female). The mean duration of the conversations was 38.25 ± 21.28 minutes. Identified themes included: sports and recreation; perception of their injury; similarities between the mentor

and mentee; accessibility issues in the home and community; information about available resources; the importance of support from peers; aging with SCI; and physiological changes due to SCI, particularly with sensory and motor function and changes with the bladder and bowel. Mentees primarily initiated conversation around these themes, with physiological changes and aging being the most commonly discussed.

Discussion: Peer mentorship conversations address various topics related to participation with topics related to physiological changes and aging being most commonly instigated by mentees. This study is the first to record and inductively code SCI peer mentorship conversations. Future research will apply these findings to develop coding frameworks that will allow for in-depth conversation analyses of peer mentorship conversations and will ultimately aim to improve SCI peer mentorship programs.

IDENTIFYING HEALTH AND WELLNESS PERCEPTIONS AND NEEDS AMONG WIC EMPLOYEES

Natasha Birchfield, B.S., M.S.[1], Jennifer Huberty, PhD [2], Carrie Zavala, M.S., R.D.[3], Jeanene Fowler, B.S.[3]

[1]Arizona State University, Chandler, AZ; [2]Arizona State University School of Nutrition and Health Promotion, Phoenix, AZ; [3]Maricopa County Department of Health, Phoenix, AZ

Introduction: Social service employees are at risk for experiencing poor health due to the burden associated with job stress (i.e. difficult clients, volatile situations). There is a need for worksite interventions specifically designed for stress associated with social service employment. The purpose of this qualitative research study was to identify Women, Infants, and Children's Nutrition Program (WIC) employee perceptions of health and wellness to inform a worksite wellness program. **Methods:** Four focus groups were conducted with 38 WIC staff and 14 30-minute interviews with WIC supervisors. Data were analyzed by WestGroup Research. **Results:** Data were organized by individual health and wellness (IHW) and role of the employer in health and wellness (EIHW). IHW had three subthemes: (1) health and wellness concerns, (2) ways staff stay healthy (3) barriers to health and wellness. EIHW had five subthemes: (1) aspects employer *should* support; (2) ways employer supports; (3) ways employer *could* support; (4) obstacles to participation; and (5) motivators for participation. The major health and wellness concern was stress. Walking was most identified as a way to stay healthy. Health and wellness barriers were time and work environment. In relation to the role of the employer, WIC staff felt physical and mental health, and the environment *should* be supported. Staff felt WIC provided health insurance, health coaching, and mental health services but most services were inaccessible. Staff felt the employer *could* provide support for stress reduction, fitness and diet, environmental improvements (i.e., cleanliness, standing desks), and staff appreciation. Obstacles to participation included location (i.e., programs are off-site and too far away), time, policies, stress (i.e., demands of the day leads to fatigue and low motivation), email challenges, lack of space in clinic, and cost. Motivators included positive encouragement from leadership, fellowship (i.e., inclusion in programs, support from others), offering programs in-clinic, allowing worktime (i.e. scheduled breaks) to participate, participation incentives, and staff appreciation. **Discussion:** Programming that is supported by leadership and is aligned with employee needs is critical for the success of worksite health and wellness programs. The results of this study will inform the implementation of an evidenced-based wellness program targeting stress reduction and physical activity behaviors in WIC staff.

IMPACT OF A COMMUNITY-BASED DIABETES PREVENTION AND MANAGEMENT PROGRAM FOR IMPROVING PHYSICAL ACTIVITY IN WEST VIRGINIA

Jonathan Stewart, M.S., Ranjita Misra, PhD, Samantha Shawley, MS, Spencer Ingels, M.A., Brandon Lucke-Wold, MS

West Virginia University, Morgantown, WV

Physical activity is critical for blood glucose management and overall health in individuals with diabetes and pre-diabetes. Researchers have estimated that as much as 10% of type 2 diabetes cases worldwide are caused by physical inactivity. More specifically, West Virginia is burdened by higher rates of type 2 diabetes and physical inactivity. This study explored the relationship of physical activity with anthropometric and clinical factors among participants in a community-based diabetes prevention and management (DPM) program.

Eighty-three adults with type 2 diabetes and pre-diabetes completed a 12-month (22-session) DPM program in two churches in Morgantown and Charleston WV (completion rate 82%). The program was modeled after the Diabetes Prevention Program and modified to include diabetes management sessions. The trained student health coaches (HCs) (included a multidisciplinary group of undergraduate and graduate students) were used as change agents; HCs had weekly communications with the participants to provide continuous feedback and reinforcement of health education messages. Program assessments included step count (pedometer), surveys, clinical (blood pressure, triglycerides, cholesterol) and anthropometric measurements (weight, waist circumference (WC), body mass index, and % body fat).

Mean age was 58.5 years; 63% self-reported that they had diabetes; 38 participants (75% females, 63% diabetics) completed the weekly activity log to track their physical activity for at least 24 weeks (46% activity log completion rate). A significant improvement in physical activity occurred from baseline (2nd and 3rd week) to mid-program (17th to 19th week) (*p=0.05*). There was a significant (negative) bivariate association between average steps and BMI and WC ($p < .05$). Controlling for Weight, WC and HDL in the multiple linear regression, physical activity was significantly associated with change in A1c between baseline and 6-months ($p=0.042$).

Results show that a lifestyle education program can have a positive impact on improving physical activity. Partnerships with churches to deliver evidence-based diabetes programs can serve as a prototype for future efforts to improve physical activity and health outcomes for WV communities

IMPACT OF A HEALTH PROMOTION INTERVENTION ON FEMALE ULTRA-ORTHODOX JEWISH TEACHERS' HEALTH BEHAVIORS AND HEALTH SELF-EFFICACY

Elisheva Leiter, PhD[1], Sima Wetzler, BS[2], Keren Greenberg, MPH[3], Osnat Keidar, MPH, PHD[4], Donna Zwas, MD, MPH[5]

[1]inda Joy Pollin Cardiovascular Wellness Institute for Women, Hadassah University Medical Center, Jerusalem, Yerushalayim, Israel; [2]Linda Joy Pollin Cardiovascular Wellness Institute for Women, 2, Yerushalayim, Israel; [3]Linda Joy Pollin Cardiovascular Wellness Institute for Women, 222, KS; [4]Linda Joy Pollin Cardiovascular Wellness Institute for Women, ff, CO; [5]Cardiology Department, Hadassah University Medical Center, Jerusalem, Yerushalayim, Israel

Introduction: Women in low socio-economic, religious, cloistered communities often have lower levels of health knowledge and preventive health behaviors. Ultra-Orthodox Jewish (UOJ) women engage in lower levels of preventive health behaviors and have higher rates of diabetes and obesity. Interventions aimed at improving engagement in preventive health behaviors in this population are unknown. This study evaluated the impact of a health promotion intervention with UOJ female high school teachers on health knowledge, preventive health behaviors, general health self-efficacy, and self-rated health status.

Methods: 246 female UOJ teachers from two girls' high schools in Israel completed questionnaires before and one year following a school-based health promotion intervention. Questions included demographic, preventive health behaviors, health knowledge items, self-rated health status, as well as a general health self-efficacy scale.

Results: Women's age range was 21-71, average number of children was 6.4 (range= 0-17), 36% were below poverty level and 55% were overweight or obese. Post intervention, women had increased knowledge of heart attack symptoms $p < .005$) and cardiovascular disease risk factors ($p < .05$). They had increased whole grain consumption ($p < .05$), decreased margarine consumption ($p < .05$), and increased blood pressure testing ($p < .005$). Women also reported increased accuracy in self-rated health status ($p < .005$) and increased general health self-efficacy ($p < .005$).

Conclusions: This study is the first investigating an intervention aimed at improving engagement in preventive health behaviors with UOJ women. School-based health promotion interventions can improve health knowledge, preventive health behaviors, self-perception of health status, and health self-efficacy in female UOJ high school teachers. Utilizing the school setting in interventions aimed at improving engagement in preventive health behaviors may provide an accessible, effective method for preventive health behaviors promotion in UOJ and other women from low SES, religious, cloistered populations.

IMPACT OF A MODULAR SOCIAL COGNITIVE SMARTPHONE APPLICATION ON PHYSICAL ACTIVITY IN ADULTS: A RANDOMIZED FACTORIAL TRIAL

Jason Fanning, PhD[1], Sarah Roberts, M.S.[2], Charles Hillman, PhD[3], Sean P. Mullen, PhD[4], Lee M. Ritterband, PhD[5], Edward McAuley, PhD[6]

[1]Wake Forest University, Winston Salem, NC; [2]University Of Illinois At Urbana - Champaign, Urbana, IL; [3]Northeastern University, Boston, MA; [4]University of Illinois at Urbana-Champaign, Urbana, IL; [5]Center for Behavioral Health & Technology, Charlottesville, VA; [6]University of Illinois at Urbana Champaign, Urbana, IL

Smartphones have received considerable attention as vehicles for behavioral intervention, but a focus on randomized controlled trials has provided mHealth developers with little guidance in constructing their own health apps. The present study aimed to assess the individual and combined impact of two social cognitive theory (SCT)-based “intervention ingredients” on moderate to vigorous physical activity (MVPA) and important SCT outcomes. Adults (N = 116; M_{age} = 41.38 7.57) were recruited to participate in a goal-driven 12-week MVPA intervention, and were randomized to receive the base-level app containing 3 common eHealth tools (i.e., MVPA tracking, instant/bi-weekly feedback, weekly educational modules), base-app + guided goal setting (i.e., GGS; participant behavior automatically generated weekly goal-setting strategies and recommendations), base-app + points-based feedback (i.e., PBF: all app features were associated with points, motivational content, levels, and badges), or the base-app + both modules. MVPA was assessed via accelerometry at baseline and week 12. SCT outcome measures included the exercise self-efficacy scale (EXSE); lifestyle self-efficacy scale (LSE); barriers self-efficacy scale (BARSE); multidimensional outcome expectations (OE) for exercise scale, which included physical (POE); social (SOE); and self-evaluative (SEOE) subscales; the perceived barriers scale (PBE); and exercise goal-setting scale (EGS). Repeated measures factorial analysis of variance (RM-ANOVA) revealed a significant effect for time (pp=.05): those with PBF recorded an additional 5.94 minutes of daily MVPA. For BARSE, there was a significant PBF*time interaction. Post-hoc analyses indicated a protective effect for those with PBF (p=.20) and a decrease in those without PBF (p < .01). There were time effects for EXSE and LSE (p’s .02). Participants reported poorer efficacy following the intervention; however a significant time*PBF*GGS interaction for EXSE (p = .04) indicated those with PBF and GGS maintained efficacy (p = .98), while those without PBF significantly decreased (p < .01). No significant effects were present for OE. For POE there was a trend toward significance in the time*PBF interaction (p = .05): there was a nonsignificant increase for those with PBF (p=.14), and a non-significant decrease for those without (p=.2). The time effect for EGS was significant ($p < .01$): all individuals increased goal setting strategy usage, and those with PBF engaged in still greater strategy usage ($p = .01$). For PBE, the main effect for time was significant ($p < .01$). Participants perceived fewer barriers to exercise following the intervention. These results are of immediate use to mHealth developers, suggesting that although the base-level app may have been overbuilt, the use of a theory-based PBF system may positively impact MVPA and important SCT outcomes.

INTER-RATER RELIABILITY OF TAXONOMY CODING OF THE BEHAVIOR CHANGE TECHNIQUES USED IN A WEIGHT MANAGEMENT INTERVENTION

Clara Adegbite-Adeniyi, BA[1], Oluwatomisin Olayinka, MPH, RN[2], Shirley M. Moore, PhD[1]

[1]Case Western Reserve University, Cleveland, OH; [2]School of Nursing, Case Western Reserve University, Cleveland, OH

Background: The Behavior Change Technique Taxonomy (BCTTv1) was developed as a common language for describing behavior change interventions across disciplines (Michie et. al, 2013). This taxonomy tool can be used to identify the behavior change techniques that are the most effective and most frequently used in multi-component interventions. Requisite to using a taxonomy to identify and classify behavior change techniques, however, is the need to establish inter-rater reliability among taxonomy coders.

Purpose: The purpose of this study was to determine the feasibility and reliability of novice coders in coding the behavior change techniques (BCTs) used in two theoretically-different interventions of a randomized clinical trial to reduce childhood obesity.

Methods: The process involved a pair of expert coders and a pair of novice coders. Novice coders received 120 hours of online training over 3 months, including phone and e-mail correspondence with expert coders. Each person of the two pairs (expert and novice coders) independently coded the materials from two interventions. The materials consisted of 884 pages of the interventionist protocol manual and participant materials used in a 1-year family-oriented behavior change intervention that met face-to face every 2 weeks. The materials for both interventions were coded separately by each coder with adjudication by coder pairs in early phases of coding. The number of BCTs identified by each set of coders were recorded, and inter-rater reliability was calculated using prevalence- and bias-adjusted kappa (PABAK) and percent agreement.

Results: Training for each novice coder took approximately 125 hours. It took 120 hours for each novice coder to independently code the intervention materials. Inter-rater reliability between the novice coder pairs were PABAK scores of 0.80 and 0.81 and agreement scores of 88% and 90% for the two interventions, respectively. Reliability between novice coder pairs and expert coder pairs showed PABAK scores of 0.46 and 0.59 for the two interventions (acceptable PABAK ≥ 0.67 (Sim and Wright, 2005)). Percent agreement was 73% and 80%, respectively.

Conclusions: The results indicate good taxonomy coding inter-rater reliability among novice coders of two different interventions. Although the PABAK scores were not as high between novice and expert coders, the agreement was still good. Our results indicate that with adequate training, reliable taxonomy coding of behavior change techniques in behavior change interventions can be successfully achieved with newly trained individuals.

OBJECTIVELY MEASURED E-NEWSLETTER ENGAGEMENT AND WORKPLACE SEDENTARY BEHAVIOR

Miranda L. Larouche, B.S.[1], Sarah L. Mullane, Ph.D.[2], Meynard J. Toledo, B.S., M.S.[2], Sarah A. Rydell, MPH[3], Linda Feltes, M.S.[4], Brenna Vuong, M.P.H.[5], Aaron Bryant, M.B.A.[6], Noe C. Crespo, Ph.D., M.P.H.[7], Mark A. Pereira, Ph.D.[8], Matthew P. Buman, Ph.D.[2]

[1]School of Nutrition and Health Promotion, Arizona State University, Phoenix, AZ; [2]Arizona State University, Phoenix, AZ; [3]Division of Epidemiology & Community Health, University of Minnesota School of Public Health, Minneapolis, MN; [4]Minnesota Department of Health, Saint Paul, MN; [5]Fairview Health Services, Saint Paul, MN; [6]Arizona State University, Tempe, AZ; [7]San Diego State University, San Diego, CA; [8]Division of Epidemiology and Community Health, Minneapolis, MN

Workplace behavior change interventions often incorporate educational electronic messages (i.e., E-newsletters). However, there is limited objective data on whether engagement with E-newsletters actually drives behavior change. We examined whether E-newsletter engagement was associated with changes in sedentary and active behaviors during the first three months of a sedentary behavior workplace intervention. Participants (N = 413, 75.6% female, 72.4 % White, 43.6 ± 11.1 years of age) were recruited from 14 worksites in the Phoenix and Minneapolis regions to participate in a multi-component intervention to reduce sitting and increase light-intensity physical activity (LPA). E-newsletters were sent weekly for the first month and biweekly thereafter and were monitored using email tracking software (Salesforce.com, Inc.). E-newsletter engagement was assessed by “open rates” (i.e, number of emails opened) and “click rates” (i.e., number of embedded hyperlinks clicked). Participants wore an activPAL accelerometer to assess sitting, standing, LPA (< 100 steps/min), moderate-vigorous physical activity (MVPA; ≥ 100 steps per/min), number of sit-stand transitions, and long bouts of sitting (≥30 minutes) during work hours. Outcomes were standardized to an 8h workday. Mixed-effects regression models (clustered by worksite) were adjusted for age, gender, race, BMI, and job type. Participants spent 323.0 ± 86.1 minutes sitting, 106.8 ± 74.5 minutes standing, 27.4 ± 13.5 minutes in LPA, 5.7 ± 5.2 minutes in MVPA, 6.3 ± 4.0 sit-stand transitions, and 146.5 ± 92.1 minutes in long bouts of sitting at work. Open rates were associated with reductions in sitting (*b[se]*=-5.4 [2.6] min/workday, *p*=.04), but not with changes in standing, LPA, MVPA, sit-stand transitions, or long bouts of sitting. Click rates were not associated with any of the outcomes. E-newsletter engagement - as measured objectively by e-mail open rates - was associated with reductions in sitting time at work. However, the

effect did not translate to significant increases in standing or more active behaviors. Future interventions should continue to focus on E-newsletters as a viable means of intervention delivery; however, more robust methods are likely necessary for long-term and substantive decreases in workplace sedentary time.

B021 6:00 PM-7:00 PM

ACCULTURATION MODERATES AMBIVALENCE OVER EMOTIONAL EXPRESSIONS AND WELL-BEING AMONG CHINESE BREAST CANCER SURVIVORS

William Tsai, Ph.D.[1], Qian Lu, M.D., Ph.D.[2]

[1]California State University, San Marcos, Vista, CA; [2]University of Houston, Houston, TX

Ambivalence over emotional expression (AEE) is defined as individuals' internal conflict between wanting to express their emotions but fearing the consequences of such expressions. In one study among European American gastrointestinal cancer patients, AEE was associated with greater pain and lower quality of life. Whereas low levels of AEE are regarded as essential to healthy interpersonal and intrapersonal functioning among European Americans, the ability to restrain or control emotions to maintain social harmony is a sign of maturity and social awareness among Asian Americans. Hence, the relations between AEE and well-being may be different among Asian Americans. Few studies to date have examined these emotional processes using a sample with chronic illness that prioritizes emotional self-control. The present study examines the relations between AEE and well-being (viz., depressive symptoms and quality of life) as a function of acculturation among a sample of 93 Chinese breast cancer survivors. Specifically, we predicted that AEE would not be predictive of quality of life and depressive symptoms among less acculturated Chinese breast cancer survivors, whereas AEE would be associated with lower quality of life and greater depressive symptoms among highly acculturated Chinese breast cancer survivors. Consistent with our hypotheses, we found that acculturation moderated the relations between AEE and depressive symptoms, $F(1, 82) = 6.18$, $p < .05$, $\Delta R^2 = .06$, $\eta_p^2 = .07$, and marginally moderated the relations between AEE and quality of life, $F(1, 84) = 3.36$, $p = .07$, $\Delta R^2 = .03$, $\eta_p^2 = .04$. Specifically, AEE was positively associated with higher depressive symptoms (B = .20, $p < .001$) and lower quality of life (B = -.45, $p < .001$) for women with high acculturation, but not for women with low acculturation (B = .04 and -.15, $p > .05$ for depressive symptoms and quality of life, respectively). As Chinese women acculturate to mainstream American culture and obtain Western values of individuality, self-assertion, and emotional expression, AEE becomes a detrimental emotional process associated with maladjustment. Future research would benefit from exploring the directionality of these processes and explore specific cultural values that were obtained or lost as a function of acculturation.

ADVOCACY AND STIGMA AMONG PATIENTS WITH LUNG CANCER

Sarah N. Price, B.A.[1], Jamie S. Ostroff, Ph.D.[2], Megan Shen, PhD[3], Anna J. Thomas, Ph.D.[4], Simon J. Craddock. Lee, PhD, MPH[5], Heidi Hamann, PhD[6]

[1]The University of Arizona, Tucson, AZ; [2]Memorial Sloan Kettering Cancer Center, New York, NY; [3]Weill Cornell Medicine, New York, NY; [4]Baylor University Medical Center, Dallas, TX; [5]UT Southwestern Harold C. Simmons Comprehensive Cancer Center, Dallas, TX; [6]University of Arizona, Tucson, AZ

Introduction: Stigma is pervasive among patients with lung cancer, and is associated with negative psychosocial and behavioral outcomes. To develop stigma-focused interventions, there is a need to understand potential avenues of adaptive coping and stigma resilience among lung cancer patients. Preliminary investigations (e.g., Brown & Cataldo, 2013), including our previous qualitative work (Hamann et al., 2014), indicate that patient engagement in lung cancer advocacy (supporting a cause, idea, and/or policy through knowledge, personal contact, fundraising and other organized activities) may mitigate negative effects of stigma for patients. The present quantitative analysis builds on this work to examine lung cancer advocacy and possible relationships to stigma and other characteristics among patients with lung cancer.

Methods: The sample included 231 patients (147 women; 84 men) diagnosed with lung cancer and recruited from outpatient clinics associated with two NCI-designated cancer centers. Lung cancer advocacy was assessed through four items endorsed on a 1-5 scale ("I have tried to learn as much as I can about my lung cancer"; "I have been involved in a group that promotes lung cancer awareness"; "I have wanted to help others who have lung cancer"; "I have tried to share with others what I know about lung cancer"). Lung cancer stigma was assessed using the *Lung Cancer Stigma Inventory (LCSI;* Hamann et al., In press*)*, a 25-item measure reflecting factors of Perceived Stigma (negative appraisal and devaluation from others), Internalized Stigma (self-blame, guilt, and regret), and Constrained Disclosure (social avoidance, disclosure discomfort, and disengagement).

Results: We found a statistically significant difference in advocacy based on smoking status, *F* (2, 216) =3.35, *p*=.04), with never smokers reporting higher scores (*M*=12.28) on the advocacy measure than current smokers (*M*=9.79; *p*=.02) and marginally higher scores than former smokers (*M*=11.37; *p*=.10). Although not significantly associated with factors of perceived or internalized stigma, advocacy was negatively correlated with the factor of constrained disclosure (*r*=-0.19; *p* < .01).

Conclusions: Involvement in advocacy may buffer lung cancer patients against the social avoidance and disengagement associated with lung cancer stigma. Advocacy involvement may enhance social support and feelings of shared purpose that help guard against constrained disclosure. Facilitating community involvement and advocacy may be useful components of multifaceted interventions to mitigate lung cancer stigma. There may, however, be barriers to advocacy engagement for current smokers that require increased focus and understanding.

CHALLENGING THERAPEUTIC DISCUSSIONS WITH LATINO CANCER PATIENTS: PROVIDER PERSPECTIVES FROM LATIN AMERICA AND THE USA

Rosario Costas-Muñiz, PhD[1], Olga Garduño-Ortega, B.A.[1], Xiomara Rocha-Cadman, MD[2], Javier González, MFA[3], Francesca Gany, MD, MS[4]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]MSKCC, Ny, NY; [3]Memorial Sloan-Kettering Cancer Center, New York, NY; [4]Immigrant Health and Cancer Disparities Center, Memorial Sloan Kettering Cancer Center, New York, NY

BACKGROUND: Latino cancer patients (LCP) are at risk of poor psychological outcomes. Managing distress in LCP requires therapeutic skill and cultural competency. In this study, we explored mental health providers'(MHP') perceptions about the challenging or difficult aspects of discussing the cancer diagnosis (CD), cancer prognosis (CP) and death and dying (DD) in therapeutic discussions.

METHODS: A survey with open-ended questions was emailed to MHP practicing in the USA and Latin America. Three qualitative questions explored difficult aspects of counseling LCP when discussing the CD, CP and DD issues. Fifty five MHP providing mental health services in Spanish participated. Four independent coders coded responses and inductive content analysis was utilized to analyze the data.

RESULTS: Ten percent of MHP reported that they find challenging having discussions about the CD, 21% about CP, and 28% about DD. Thematic categories across the three areas (CD, CP, and DD) were: 1) emotional impact and coping, 2) cultural issues, and 3) patient-provider related themes. Providers perceived difficulty addressing the emotional impact and coping strategies of patients; particularly, it was difficult to address distress and coping mechanisms such as denial and avoidance when talking about CD, CP, and DD. There was a need for increased cultural sensitivity to address LCP specific cultural beliefs. There was an expressed need to build therapeutic trust and to receive specialized training to treat LCP.

A significant theme was the lack of information, cancer-related education, and/or communication about the CD and CP. Stigma was challenging in conversations about CP and DD, specifically, fatalistic perceptions about cancer and death taboo. Family impact and the desire to protect the family were challenging themes during DD conversations.

DISCUSSION: MHP describe encountering many challenges in their therapeutic discussions with LCP about CD, CP and DD. Addressing the emotional impact, the educational needs, the

cultural context, stigma, and family impact, were challenging aspects of having these conversations. The need for specialized training to improve therapeutic effectiveness during therapeutic discussions was emphasized. Psycho-oncology educators and training programs should incorporate additional training on how to address these challenging topics and the cultural context of patients in a sensitive manner.

CHANGES IN OBJECTIVELY MEASURED ACTIVITY OVER 6 MONTHS AMONG BREAST CANCER SURVIVORS ON ADJUVANT THERAPY

Cynthia C. Forbes, PhD[1], Melanie Keats, PhD[1], Daniel Rainham, PhD[2], Tallal Younis, MD[3], Cynthia Blanchard, PhD[1]

[1]Dalhousie University, Halifax, NS, Canada; [2]Dalhousie Univeristy, Halifax, NS, Canada; [3]Nova Scotia Health Authority, Halifax, NS, Canada

Objective: The objective of this study was to assess the prevalence of objectively measured moderate-to-vigorous PA (MVPA), light and sedentary time among breast cancer survivors (BCS) currently undergoing adjuvant therapy. We also wanted to determine if there were any changes over time.

Methods: Participants completed baseline surveys and wore an accelerometer to measure MVPA during waking hours for nine consecutive days at baseline and 6 months. Seven valid days were used by deleting the first and last day if nine were completed. 5-second epochs were used to provide a more sensitive estimate of MVPA levels. Repeated Measures Analyses of Variances (R-ANOVAs) were used to determine changes over time.

Results: BCS were recruited from the QEII Health Science Centre in Halifax, Nova Scotia. Of the 114 approached 77 (68%) agreed to participate. Participants were aged 57 years, 68% married, 51% employed, and BMI of 28kg/m^2. 70 (91%) and 56 (72%) provided PA data for ≥3 valid days at T1 and T2 respectively. At baseline, the average duration of MVPA bouts was 119 minutes and 27% were meeting guidelines. At 6 months, the average duration was 138 minutes and 38% were meeting guidelines. Sedentary time did not change from T1 to T2 (597 vs 601 minutes). Significant increases from T1 to T2 were found in daily light minutes (+6.9; p=.048), daily moderate minutes (+5.6; p=.021), weekly moderate minutes (+42.7; p=.007), and weekly MVPA minutes (+36.5; p=.045).

Conclusion: This study found that BCS increased their objectively measured light and MVPA over six months. This would generally be when most survivors have completed the majority of their treatments. They may be feeling better and are returning to their previous activity levels. However, the smaller number of T2 measures may bias the results and artificially inflate them. More research needs to be conducted with larger sample sizes to gain a more accurate representation of activity levels of BCS undergoing adjuvant therapy.

DEVELOPMENT OF A PATIENT NAVIGATION INTERVENTION TO IMPROVE COLORECTAL CANCER CARE

Tatianna Clark, NA[1], Claudia Carrizosa, MD[2], Samir Gupta, MD[3], Balambal Bharti, Staff Res Assoc[3], Jesse Nodora, DR. PH[3], Elva M. Arredondo, PhD[2], Christian Ramers, MD[4], Yessenia Magana, n/a[5], Eden Sosa, MBA[4], Felipe Garcia-Bigley, MHA[4], Jessica Haughton, MPH, MA[6], Jamie Moody, MS[7], Kristen Wells, Ph.D., MPH[2]

[1]San Diego State University, Chula Vista, CA; [2]San Diego State University, San Diego, CA; [3]University of California, San Diego, La Jolla, CA; [4]Family Health Centers of San Diego, San Diego, CA; [5]Family Health Centers of San Diego, Sasn diego, CA; [6]San Diego State University/UC San Diego Moores Cancer Center Partnership Institute for Behavioral and Community Health, San Diego, CA; [7]Institute for Behavioral and Community Health, San Diego, CA

Purpose: Compared to non-Hispanic whites, Hispanics/Latinos are at an increased risk for cancer disparities. This intervention development study outlines the creation of a patient navigation (PN) intervention designed to improve colorectal cancer (CRC) diagnostic care and screening at a Federally Qualified Health Center (FQHC). ***Methods:*** Evidence-based environmental and behavioral determinants from CRC literature and data from semi-structured interviews with staff (n=17) at a FQHC provided the needs and context for the intervention. Intervention Mapping (IM) steps 1-4, encompassing themes generated from the Social Ecological Model (SEM), were then used to develop an outcome-oriented intervention. ***Results:*** During step 1 of IM, researchers collected data from literature searches and interviews conducted with the FQHC's staff to identify the specific assets and barriers contributing to completion of recommended CRC screening and diagnostic care. In step 2, researchers created a logic model of the problem based on the SEM model; this model outlined the behavioral and environmental determinants and factors contributing to the health problem (premature death from CRC and poor health-related quality of life). Researchers then decided on specific behavioral and environmental outcomes for the intervention (e.g., completing diagnostic/screening colonoscopy within 3 months of provider order [behavioral], and navigator explaining a health care provider's recommendation for screening/diagnostic colonoscopy in the patient's preferred language [environmental]).To accompany intervention outcomes, performance objectives describing how the outcomes could be accomplished were included. To complete steps 3-4, researchers are using the outcomes and performance objectives to create the program's structure, materials, and

protocols using health behavior theory. ***Conclusion:***This study describes the development of a CRC PN intervention for Hispanic/Latinos served by a FQHC that has the potential of lessening the CRC burden among this community.

DEVELOPMENT OF AN EDUCATIONAL VIDEO TO PROMOTE CERVICAL CANCER SCREENING AMONG BURMESE AND BHUTANESE REFUGEE WOMEN IN THE US

India Ornelas, PhD[1], Bouapanh Lor, MPH[1], Maya Magarati, PhD[2], H. Hoai Do, Ying Zhang, MD, MPH[1], J. Carey Jackson, Victoria M. Taylor, MD, MPH[3]

[1]University of Washington, Seattle, WA; [2]Indigenous Wellness Research Institute, School of Social Work, University of Washington, Seattle, WA; [3]Fred Hutchinson Cancer Research Center, Seattle, WA

Background: Immigrant and refugee women in the United States (US) have high cervical cancer incidence rates coupled with low cervical cancer screening rates. Women from Southeast Asian and other US communities with a high proportion of refugees are among the most likely to have never been screened. Refugees from Burma and Bhutan were the two largest refugee groups arriving in the US in 2011, making up 56 percent of all resettled refugees. These refugee communities come from countries that experience marked cervical cancer disparities. However, little is known about cervical cancer screening among these refugee groups and few health education interventions have targeted this population. **Methods:** Using the Behavioral Model for Vulnerable Populations as a conceptual framework, we conducted eight focus groups in King County, Washington to gather information about women's perceptions and knowledge of cervical cancer (need for care factors) as well as their cervical cancer screening barriers and facilitators (predisposing and enabling factors). A total of 58 women participated (Burmese n=31; Bhutanese n=27). **Results:** Only 28% reported being screened for cervical cancer before coming to the US and 55% reported being screened after resettling in the US. The focus groups revealed limited knowledge about cervical cancer and the need for screening; barriers such as competing priorities and cost; and facilitators such as trusted providers, interpreters, and support from social networks. We used our findings to develop two 15 minute narrative educational videos (one in Nepali for Bhutanese women and one in Karen for Burmese women) that provide basic information about women's anatomy and reproductive health, guidelines for cervical cancer screening, a description of screening procedures, and how to request female providers and interpreters. We are currently pilot testing the videos to assess changes in knowledge and cervical cancer screening intentions. **Conclusions:** Bhutanese and Burmese refugee women are in need of culturally relevant health education about cervical cancer screening. If effective, educational videos may serve as a useful tool for reaching a population at high risk for cervical cancer.

DEVELOPMENT OF AN MHEALTH BEHAVIORAL CANCER PAIN PROTOCOL FOR MEDICALLY UNDERSERVED COMMUNITIES

Sarah Kelleher, Ph.D.[1], Caroline Dorfman, Ph.D.[1], Rebecca Shelby, Ph.D.[1], Beverly Thorn, Ph.D., ABPP[2], Francis Keefe, Ph.D.[1], Tamara Somers, Ph.D.[1]

[1]Duke University Medical Center, Durham, NC; [2]The University of Alabama, Tuscaloosa, AL

Cancer patients in medically underserved areas, characterized by a shortage of healthcare providers and services and economic or cultural barriers to healthcare, report higher pain, more negative pain-related outcomes, and are less likely to have their pain adequately treated. Women with breast cancer in these areas are particularly vulnerable to pain; they are often diagnosed at a later stage, increasing their risk of disease- and treatment-related pain. Behavioral cancer pain interventions can help with pain management. Persistent barriers (e.g., transportation, lack of experts) inhibit the use of these interventions with medically underserved populations. To address this need, we developed a mobile-health (mHealth) Pain Coping Skills Training protocol (mPCST) specifically tailored for women with breast cancer in medically underserved areas. A nationally recognized expert in applying behavioral pain protocols to patients with low-literacy in rural areas provided extensive input into tailoring the intervention. Patient focus groups were conducted to aid in intervention development. Participants (N=19) had a primary diagnosis of breast cancer, reported clinical pain at a 3/10 or greater (0=no pain, 10=worst pain imaginable), and received cancer treatments at a clinic in a medically underserved area. Three 90-minute focus groups were held. Demographic, medical, and self-reports of pain were collected. Participants provided verbal information about their pain experiences and input on the intervention. Group feedback was used iteratively to update the intervention. Field notes and audio recordings were reviewed, and themes were identified. Women were *M*=60 years old, married (63%), and the majority were African-American (53%); 25% had a college degree or more and 33% were working full or part time. Women reported their pain to be *M*=3.2/10 in the last week. Participants reported pain and fatigue were significant unaddressed concerns. Participants reported limited behavioral intervention opportunities and were enthusiastic about mHealth resources. Participants endorsed willingness to travel to their home clinic to participate in tele-video conferencing and to use mobile phones as an adjunct intervention component. They suggested explicit direction be given for use of mHealth technologies. Results suggest that an mPCST intervention designed to meet the needs of breast cancer patients in medically underserved areas is likely to be feasible and acceptable. Key protocol modifications based on focus group data include addressing fatigue, modifying activity suggestions, and creating detailed mHealth

technology instructions. mHealth technologies provide new opportunities to implement efficacious behavioral cancer pain interventions and have the potential to benefit underserved populations. We are currently testing the mPCST protocol in a small trial.

DEVELOPMENT OF THE TRUENTH PROSTATE CANCER PEER NAVIGATION CORE COMPETENCY FRAMEWORK

Parminder K. Flora, PhD[1], Jacqueline L. Bender, BSc, MSc, PhD[1], Aaron Miller, MHI, MSc[2], Lisa Parvin, MSc[3], Shimae Soheilipour, PhD[4], Nandini Maharaj, PhD candidate[4], Andrew G. Matthew, PhD., C.Psych[5], Arminee Kazanjian, DrSoc [4]

[1]Princess Margaret Cancer Centre, University Health Network, Toronto, ON, Canada; [2]Prince Margaret Cancer Centre, Toronto, ON, Canada; [3]School of Population and Public Health, University of British Columbia, Vancouver, BC, Canada; [4]University of British Columbia, Vancouver, BC, Canada; [5]Princess Margaret Cancer Centre, Toronto, ON, Canada

Peer navigation (PN) is an emerging concept in cancer care where individuals who have experienced cancer volunteer valuable informational, emotional and practical support to new patients and their caregivers (CG; Freeman, 1995; CPAC, 2010). PN in prostate cancer (PC) is in line with reports from men with PC about their preference for one-to-one support from peer cancer survivors (King et al, 2015). While some existing literature is available to guide the definition, role, and scope of peer navigators, no existing framework defined core competencies specific for PC peer navigators. Furthermore, no known sources included the CGs of men with PC as peer navigators. The study aim was to develop a set of core competencies for PC peer navigators to guide the definition, role, and scope of peer navigators, and a subsequent PN training program. Drawing on existing literature and stakeholders, we developed the PN Core Competency Framework in 3 phases. Phase 1: Identified PN knowledge, skills, abilities, or attributesfrom formative research including (a) a systematic review, (b) an environmental scan of cancer navigation programs, and (c) semi-structured qualitative interviews exploring PC navigational support needs among patients, CGs, and healthcare providers. Phase 2: Drafted initial set of competency statements and mapped into domains. Phase 3: Verified competency statements with PN stakeholders via an online survey in which agreement with inclusion (yes/no) and priority (low/medium/high) were rated. In the verification phase, 27 participants (19 patients, 3 CGs, and 5 healthcare providers) completed the online survey. The majority of participants rated the competencies as medium and high priority. Most statements had an affirmative consensus for inclusion, with comments about exclusion pertaining to concerns about overlapping role with healthcare providers, time required to execute, and limited knowledge/information. Following revisions, the resulting consensus-based framework consisted of 6 core competency domains for PC peer navigators: (1) navigator attributes (e.g., professionalism, cultural

competency, responsibility, self-awareness, empowerment, problem-solving, character, personal and professional development); (2) communication; (3) knowledge/information; (4) facilitate patient-centered care; (5) eHealth/technology; and (6) CG needs. This framework can be used to develop a PN training program to prepare PC survivors for a peer navigator role.

DIFFERENT METHODS OF LOCALIZATION FOR NON-PALPABLE BREAST TUMORS AND PATIENT REPORTED ANXIETY

Cindy Matsen, MD[1], Yue Zhang, PhD[2], Matthew Stein, MD[3], Kimberly Kaphingst, ScD[4]

[1]Huntsman Cancer Institute at the University of Utah, Salt Lake City, UT; [2]University of Utah, Salt Lake City, UT; [3]University of Utah School of Medicine, Salt Lake City, UT; [4]University of Utah and Huntsman Cancer Institute, Salt Lake City, UT

Background: Women with breast tumors that cannot be felt on exam need to have a localization procedure done in radiology to help the surgeon find the right area to take out. The most common way this is done is with a wire (WL) that is placed into the breast on the day of surgery. An alternative method uses a radioactive seed (SL) that gives off a signal that can be detected with a probe in the operating room. The seed is contained entirely within the breast and can be placed days before surgery. There are several advantages to using seed localization with the scheduling advantages for the surgeon and radiologist being the most widely recognized, but there is very little data on the patient experience and no study has specifically looked at patient reported anxiety at the time of the procedure As we implemented a seed localization program in our institution, we aimed to explore the patient experience with a specific focus on peri-procedure anxiety. We hypothesized that WL would be associated with greater anxiety because it must be done on the day of surgery and because WL can be associated with delaying the surgery start time which may be anxiety provoking.

Methods: Patients with non-palpable, invasive or pre-invasive breast cancer with no history of anxiety disorder, who had not undergone a localization procedure in the past were recruited. The WL group consisted of patients prior to implementation of the SL program and patients in the SL group were recruited after program implementation. All patients completed a validated, single-item anxiety assessment (5 point Likert scale with a 0.78 correlation to the State Trait Anxiety Inventory) before and after the procedure. Scheduled surgery time and the time the patient arrived in the OR were recorded for all patients. Logistic regression models were used to compare the likelihood of increased anxiety and time delay in the start time in OR between the two groups, controlling for age and family history of cancer.

Results: The 29 patients in the WL group and 31 patients in the SL group were well matched for all demographic and disease characteristics. There were no significant differences in pre-procedure, post-procedure, or change between pre and post-procedure anxiety between the two groups. The majority of patients reported low pre and post-procedure anxiety. Patients

with high levels of post-procedure anxiety were seen more often in the WL group, but this was not statistically significant. There were significant differences in delay time to the OR with seed localization associated with lower likelihood of delays (OR for seed 0.024 (95% CI 0.003-0.207), $p < 0.001$).

Conclusions: Implementation of a seed localization program reduced delays to the operating room. Delays to the operating room decrease patient satisfaction and impact negatively on the patient experience, but this is not associated with anxiety levels around the time of the localization procedure.

DO SPOUSAL CANCER CAREGIVERS RECEIVE ADEQUATE DEPRESSION TREATMENT? EVIDENCE FROM A POPULATION-BASED STUDY

Kristin Litzelman, PhD[1], Abiola Keller, PA-C, MPH, PhD[2]

[1]University of Wisconsin-Madison, Madison, WI; [2]Marquette University, Milwaukee, WI

Background: Recent research suggests that mental health problems in spouses are associated with worse mental health in cancer survivors. Adequately treating spousal mental health problems therefore represents an opportunity to improve outcomes for both cancer survivors and their co-surviving family members. Using nationally representative data, this study sought to determine how depression treatment differs between spousal cancer caregivers with depression compared to the general married population and assess rural/urban disparities in treatment.

Methods: Data are from the Medical Expenditures Panel Survey, a household-based survey of US adults; we concatenated data from 2004-2013. We identified spouses of cancer survivors and a comparison group of married adults. Key measures included depression (ICD-9 codes generated from participant interviews), adequacy of depression treatment (at least four prescriptions related to depression treatment, or at least eight psychotherapy or counseling visits), and sociodemographics. We calculated the prevalence of depression in spousal caregivers and comparisons. Among caregivers and comparisons with depression, logistic regression evaluated the association between caregiver status and receipt of adequate treatment, controlling for sociodemographics; secondary analyses included rurality as a moderator. Analyses were weighted to account for the complex sampling design.

Results: Twelve percent of spousal caregivers were depressed, compared with 9% of the general married population. Most depressed caregivers received guideline concordant treatment (65%), with no difference from comparisons (60%; p=0.50). Urban caregivers were less likely to receive adequate treatment compared to urban comparisons (Odds Ratio [OR]: 0.39, 95% Confidence Interval [CI]: 0.17-0.91). Rural caregivers did not differ significantly from urban comparisons (OR: 0.88, 95% CI: 0.59-1.31) or rural comparisons (OR: 1.05, 95% CI: 0.72-1.52). However, rural comparisons were less likely to receive treatment than urban comparisons (OR: OR: 0.84, 95% CI: 0.72-0.98).

Conclusions: Although spousal caregivers overall receive adequate depression treatment at rates roughly equal to their non-caregiving counterparts, these data suggest that urban caregivers may be at increased risk of inadequate treatment. Future research should examine

and seek to mitigate clinical- and community-level barriers to depression care for urban caregivers.

EFFECTS OF SOCIAL MEDIA ADVERTISEMENT CONTENT ON THE RECRUITMENT OF YOUNG GAY AND BISEXUAL MEN FOR AN HPV VACCINE INTERVENTION

Paul L. Reiter, PhD[1], Annie-Laurie McRee, DrPH[2]

[1]The Ohio State University, Columbus, OH; [2]University of Minnesota, Minneapolis, MN

Background. Social media is a promising approach for reaching and recruiting participants for research studies. We sought to evaluate the effects of different images and text included in social media advertisements (ads) used to recruit young gay and bisexual men for an online human papillomavirus (HPV) vaccine intervention.

*Methods.*In July and September 2016, we used paid Facebook advertisements to recruit men who were ages 18-25, self-identified as gay or bisexual, lived in the US, and had not received any doses of HPV vaccine. A 4x2x2 factorial experiment varied the ad image (a single young man, a male couple, a group of young men, or a young man talking to a doctor), content focus (text about HPV infection or HPV vaccine), and disease framing (text about a sexually transmitted disease [STD] or cancer). Poisson regression determined if these experimental factors affected ad performance.

Results. The recruitment campaign reached a total of 35,646 Facebook users and resulted in an overall unique click-through rate of 2.01% and an overall conversion rate of 0.66%. Ads that included an image of a male couple had a higher reach (IRR=4.91, 95% CI: 2.68-8.97) and conversion rate (IRR=2.56, 95% CI: 1.13-5.77) compared to ads that included an image of a single young man. The unique click-through rate was higher for ads with text about an STD compared to ads with text about cancer (IRR=1.34, 95% CI: 1.06-1.69). The campaign cost a total of $413.72 and resulted in 150 eligible and enrolled individuals ($2.76 per enrolled participant).

Conclusions. Facebook was an efficient and cost-effective approach for reaching and recruiting a national sample of young gay and bisexual men for an HPV vaccine intervention. The success of individual ads varied based on their image and text. Researchers should consider the importance of ad content in order to maximize the recruitment of participants into health-related studies via social media.

EFFECTS OF THE DOCTOR-PATIENT RELATIONSHIP ON LUNG CANCER PATIENTS' TREATMENT EXPECTATION AND QUALITY OF LIFE

Huynh Nguyen, BS[1], Laurie E. Steffen, PhD[2]

[1]University of New Mexico, Rio Rancho, NM; [2]Wake Forest University School of Medicine, Winston-Salem, NC

The doctor-patient relationship is a key component of patient quality of life in terminal illness. Patients present with different backgrounds and belief systems about illness, health, and death that can make effective communication with their physician challenging and shape treatment expectations. The extent to which a patient feels their physician is culturally competent may impair or enhance communication and care; therefore, understanding the relationship between patient perceptions of their physician and quality of life is important to improving patient care. Our study used a 21-day longitudinal design in which 20 lung cancer patients (75% stage IIIB/IV disease, MN age = 73 years; MN education = 13 years; 60% female, 80% white) completed questionnaires regarding their daily quality of life, treatment expectations, and perception of their physician's cultural competency, communication, trust, and partnership building. Higher ratings of physician's patient-centered cultural competence corresponded with higher ratings of trust ($r = .67$, $p = .001$), effective communication ($r = .57$, $p = .009$), and partnership building ($r = 0.69$, $p = .001$). Patient information index, a subscale of communication, was a significant predictor of treatment expectation ($b = 1.48$, 95% CI [.71, 2.3]). Better physician communication predicted higher daily social and role functioning ($b = 4.04$, 95% CI [1.12, 6.96]), higher daily physical functioning ($b = 4.51$, 95% CI [1.28, 7.74]), and fewer physical symptoms ($b = -.11$, 95% CI [-.18, -.04]. To our knowledge, this is the first study to relate aspects of physician communication to daily quality of life during treatment for advanced lung cancer. Results underscore that the doctor-patient relationship is multifaceted and that physician communication does play an important role in patients' quality of life. Results highlight the need for increased attention to the quality of physician interactions with patients and cultural factors, as these interactions impact patients' daily lives during illness.

EMPOWERING BREAST CANCER PATIENTS WITH WEARABLE TECHNOLOGY: HEALTH LITERACY, COMMUNICATION, AND CONNECTION: A PILOT STUDY

Cori McMahon, Psy.D.[1], Tina Harralson, Ph.D.[2], Kristen Scott, RN,BSN[3], Kelly Lynn. Gilrain, PhD[4], Philip Fizur, MA[5], Mark Redlus, BS[3]

[1]Cooper University Hospital, Department of Medicine, Woodbury, NJ; [2]Polaris Health DIrections, Inc., Wayne, PA; [3]Polaris Health Directions, Wayne, PA; [4]Cooper University Hospital, Camden, NJ; [5]MD Anderson Cancer Center at Cooper, Cooper University Hospital, Camden, NJ

According to the NCI, it was estimated that in 2013, there were over 3 million women living with breast cancer in the US; that there will be more than 249,000 new cases of breast cancer in 2016, and that 89.7% of those women will survive more than 5 years. With increasing survival rates and well-established benefits of patient-centered communication, such as improved quality of life, adherence to medical treatment regimen, and health literacy, there is a need for more efficient communication and monitoring of psychosocial and physical functioning. Wearable technology allows patients to consistently monitor symptoms and to quickly share that information with the medical team. The current study aims to assess the utility of a novel app used via Apple™ watch and iPhone in improving communication, improving health literacy, and tracking patient data, including passive data (heart rate, activity level), self-report data (mood, pain, and fatigue levels), and engagement data (use of social media, daily challenges, ability to communicate with study cohort). Twenty women with various stages of breast cancer were enrolled in the study: mean age 50 years (range: 27-66 yrs.); 80% White, 20% African American; 15% having completed some high school and 85% completing at least some college (20% graduate school). 70% of subjects reside with spouse and/or children with only 5% live alone. Intake assessment completed at enrollment indicated: 60% moderate to severe distress, 15% moderate to severe anxiety (GAD7), and 20% moderate to severe depression (PHQ9). Overall, subjects reported very good social and emotional well-being (FACT-B) and showed a range of difficulty with functional well-being (mean 18.6, SD 6.7, range: 6-27) on a scale from “28” (excellent) to “0” (very poor). Subjects reported very good satisfaction with treatment team, including communication with medical staff, confidence and trust, and willingness to recommend providers. Qualitative feedback has allowed researchers to tailor the app and includes requests for afternoon (as opposed to morning) check-in about mood, pain, and fatigue; inclusion of a sufficient number of daily challenges (i.e. take a hike, talk to a friend); and for data to be incorporated into medical chart for monitoring. Subjects reported overall satisfaction with the app and using wearable

technology for self-report and monitoring, appreciated being electronically connected, and learning about their patterns of physical and emotional functioning during treatment, which, many noted, improved targeted communication with physicians during medical exams.

ENHANCING BREAST CANCER SURVIVORSHIP FOR KOREAN WOMEN USING A RANDOMIZED CONTROLLED TRIAL TO IMPROVE QOL AND DECREASE STRESS

Sunmin Lee, ScD[1], Mary Y. Jung, MPH[2], Min Qi Wang, PHD[3]

[1]University of Maryland School of Public Health, College Park, MD; [2]University of Maryland School of Public Health, Kensington, MD; [3]UNIVERSITY OF MARYLAND, COLLEGE PARK, MD

Background: Existing research on cancer survivorship among Asian subgroups is highly sparse. Specifically, Korean American women have experienced a surge of breast cancer incidence in recent years and report low levels of quality of life (QOL) and high levels of stress, partly due to linguistic and cultural barriers, which diminish their ability to cope with cancer. However, few studies have examined breast cancer survivorship in this population underscoring the strong need for linguistically and culturally appropriate resources for Korean American breast cancer survivors (KABCS). We developed and assessed the effectiveness of *one of the first* linguistically and culturally tailored randomized controlled trial (RCT) for KABCS.

Methods: This RCT aimed to improve QOL and decrease stress using cognitive-behavioral stress management. Participants attended seven 2-hour weekly sessions and one follow-up session seven weeks after the intervention. The analytic sample consisted of 77 KABCS in the Washington, D.C. metropolitan area. The standard intervention (SI) group (n=37) were provided linguistically and culturally appropriate information related to breast cancer survivorship, whereas the enhanced intervention (EI) group (n=40) were provided the SI content in addition to information on practicing relaxation, enhancing coping, reducing stress, using social support, managing anger, and being assertive.

QOL and stress were measured at baseline (T1), end of the program (T2), and follow-up (T3). The Functional Assessment of Cancer Therapy-Breast (FACT-B), which consists of five subscales [physical well-being (PWB), social well-being (SWB), emotional well-being (EWB), functional well-being (FWB), and breast cancer subscale (BCS)] was used to assess QOL, and the Perceived Stress Scale (PSS) was used to measure stress. Generalized estimating equations (GEE) models were used to examine program effects on QOL and PSS separately.

Results: The EI group had a 5.2 unit greater increase in mean FACT-B scores, 1.7 unit greater increase in mean SWB scores, 1.1 unit greater increase in mean EWB scores, and 2.2 unit greater increase in mean FWB scores from T1 to T2 as compared to the SI group.

For mean PSS scores, EI group participants had a 2.4 unit greater decrease in mean PSS scores as compared to those in the SI group from T1 to T2. Among participants who resided in the U.S. for less than 10 years, the EI group had a significantly greater decrease of 6.8 units in mean PSS scores from T1 to T2 as compared to the SI group (p= 0.03). Likewise, among participants who resided in the U.S. for 10 or more years, EI group participants had a marginally greater decrease of 2.2 units in mean PSS scores (p= 0.05).

Conclusions: Findings support the use of a linguistically and culturally tailored support program to improve QOL and decrease stress among KABCS.

EVALUATION OF BLACK/AFRICAN AMERICAN CANCER SURVIVORS' HEALTH BEHAVIORS

Matthew Asare, PhD, MBA, CHES[1], Karen Mustian, PHD, MPH, MS[2], Luke J. Peppone, PhD, MPH[3], Joseph J. Guido, MS[2], Gary Morrow, PhD, MS[4], Calvin L. Cole, PhD[1], Ian Kleckner, PhD[2], Charles Kamen, PhD, MPH[2]

[1]University of Rochester, Rochester, NY; [2]University of Rochester Medical Center, Rochester, NY; [3]University of Rochester, Wilmot Cancer Institute, Rochester, NY; [4]university of Rochester, pittsford, NY

Introduction: Healthy eating, physical activity, tobacco cessation and maintaining healthy weight are healthy lifestyles can help cancer survivors control their risk for cancer recurrence, secondary cancers, and improve health outcomes and overall quality of life. However, the health behaviors of Black/African American cancer survivors have been understudied. We examined young, middle-aged, and older black/African American cancer survivors' health behaviors.

Methods: 2,878 Black/African American cancer survivors (age 63.79 ± 12.59 years) participated in the post-diagnosis survey and it was mixed cancer types. Survivors self-reported their body mass index (BMI), and health behaviors (Yes/No for exercising, smoking, alcohol use, and fruit/vegetable consumption). Chi-squared analyses and analyses of variance (ANOVA) were used to compare young (18-39 years), middle-aged (40-64 years) and older adults' (>65 years) health behaviors.

Results: Middle-aged and older survivors were more likely to be obese/overweight than young survivors (young 64%, middle-aged 78%, older 75%). Older survivors were more likely to be current drinkers than middle-aged and young survivors (young 49%, middle-aged 68%, older age 78%). Young survivors were more likely to be binge drinkers (young 18%, middle-aged 7%, and older 3%); and current smokers (young 31%, middle-aged 23%, and older 11%). Older adult and young survivors were more likely than middle-aged survivors to lead sedentary lifestyle (young 42%, middle-aged 28%, older adult 43%). Middle-aged survivors were less likely to eat one or more fruit servings per day (young 60%, middle-aged 58%, and older 65%). All comparisons $p< 0.05$.

Conclusion: Differences were noted across the age spectrum for unhealthy behaviors. While young African American survivors reported more unhealthy behaviors like binge drinking, tobacco use, and sedentary behaviors, middle-aged survivors reported low fruits and vegetables consumption, and older adults reported high alcohol consumption. Clinical efforts should be tailored to African American survivors to address their specific unhealthy behaviors including life stage considerations. Health behavior interventions at community and individual levels should be implemented to educate Black/African cancer survivors, especially the young survivors about healthy behaviors and its impact on health outcomes and quality of life.

EXPERIENCE OF CANCER TREATMENT IN THE US AMONG PATIENTS FROM SAUDI ARABIA

Salah Alshagrawi, MS Health Care Adminstration

TAMU, College Station, TX

Statement of the problem: An increasing number of Saudi cancer patients seek treatment in the United States. To understand this group's experience, we examined the perspectives from a group of Saudi cancer patients in a large U.S. metropolitan cancer center.

Study design: A qualitative grounded theory study**.**

Sample size and composition: Twelve cancer patients from Saudi Arabia; six females and six males, who varied in ages, diagnoses, therapies and treatment durations.

Measures utilized: In-depth face-to-face interviews

Analysis method: Interviewes were audio recorded and transcribed. A grounded theory was employed to collect and analyze the data through constructing analytical codes and categories.

Results: Our sample recognized the professionalism and kindness of their U.S. healthcare providers; especially the knowledge that their physicians' displayed and their skills, expertise, and attitudes. Moreover, they were successful in building a trustful relationship with their providers. Although interviewees encountered difficulties of living abroad, the trust with they had on their providers and the support of other Saudi cancer patients enhanced their faith in cancer treatment internationally.

Conclusion: Our Saudi cancer patient participants had a positive experience in receiving cancer treatment in the United States.

EXPRESSED AFFECT AND PERCEPTIONS OF CLINICAL INTERACTIONS

Nicole Senft, PhD[1], Lauren M. Hamel, PhD[2], Louis A. Penner, PhD[2], Terrance L. Albrecht, PhD[2], Felicity Harper, PhD[3], Tanina Foster, PhD[2], Robert Chapman, MD[4], Eggly Susan, PhD[2]

[1]Karmanos Cancer Institute/Wayne State University, Ann Arbor, MI; [2]Wayne State University/Karmanos Cancer Institute, Detroit, MI; [3]Karmanos Cancer Institute/Wayne State University, Detroit, MI; [4]Josephine Ford Cancer Center, Detroit, MI

Physicians and patients convey information via emotional behavior that is used in forming judgments about each other and their interactions. The current research is a preliminary investigation of the role of emotional expressivity in clinical interactions between Black cancer patients and their non-Black physicians. This is a secondary data analysis examining patient-physician communication during discussions of cancer treatment for expressions of emotion. Naïve coders rated the emotional expressivity of patients and physicians, as well as the rapport between them, using five “thin slices” of 74 interactions. Using generalized estimating equation (GEE) regression models to control for patients nested within physicians, we tested whether observer ratings of patient and physician positive affect, negative affect, or the combination of both predicted (a) observer ratings of patient-physician rapport and (b) patients’ post-visit perceptions of physician patient-centeredness. The interaction between patients’ positive and negative affect predicted perceptions of both rapport (β=.12, SE=.03, $p < .001$) and patient-centeredness (β=.10, SE=.03, p=.004). Observers perceived higher rapport among patients displaying positive affect, especially when patients also expressed relatively high levels of negative affect.Patients perceived their physician to be less patient-centered if they had high levels of expressed negative affect and low levels of expressed positive affect, whereas expressed negative affect was unrelated to patient-centeredness among those who had high levels of expressed positive affect. Regarding physician affect, physicians’ expressed negative affect was inversely related to ratings of rapport (β=-0.31, SE=.05, $p < .001$) and patient-centeredness (β=-.36, SE=.14, p=.011). Physicians’ positive affect was unrelated to either outcome (ps>.10). These findings suggest patients’ positive and negative emotional expressivity jointly contribute to positive perceptions of physicians and interactions, perhaps by eliciting empathic responses from physicians. However, in reverse, physicians’ high expressed negative affect may have negative consequences for patient perceptions and the quality of interactions. Future work will examine the contribution of pre-interaction attitudes and experiences that may influence patient and physician emotional expressivity.

FACTORS ASSOCIATED WITH INTENTIONS OF HPV INITIATION AMONG VACCINE NAïVE FEMALES WITH AND WITHOUT A HISTORY OF CHILDHOOD CANCER

Robin Hardin, M.A.[1], Kathryn Russell, Ph.D. [2], Jessica Simmons, M.S.[2], Jasmine Eddinger, M.S. [3], Lauren Dahlke, B.A. [1], James Klosky, Ph.D.[2]

[1]St. Jude Children's Research Hospital and University of Memphis, Memphis, TN; [2]St. Jude Children's Research Hospital, Memphis, TN; [3]University of Missouri-Kansas City, Kansas City, MO

Purpose: Effective vaccination is available to prevent many high-risk types of human papillomavirus (HPV), the most common sexually transmitted infection and cause of cervical cancer. This study aimed to examine vaccine intentions among vaccine naïve young adults with and without a cancer history in addition to identifying factors associated with HPV vaccination intentions.

Methods: Vaccine naïve females (aged 18-26 years, *n* = 120) completed surveys querying HPV vaccination intentions, HPV knowledge and communication, along with sociodemographic, medical, and health belief factors specific to HPV vaccine intent. Multivariate logistic regression was utilized to calculate odds ratios (OR) and 95% confidence intervals (CI) for HPV vaccination intentions.

Results: Univariate analyses indicated no differences between participants with/without history of cancer on intention to vaccinate or considered risk factors. Multivariate logistic regression analyses for those who self-identified as non-white revealed that those who reported their physician recommended HPV vaccination were more likely to report having intentions to vaccinate (ORs = 4.25 – 8.08, *p*s p =.014).

Conclusion: There are various factors that affect vaccine intentions among vaccine naïve young adult women. Future interventions aimed at increasing HPV vaccination intentions among childhood cancer survivors should include training providers in recommending the vaccine as a mechanism to increase vaccine intentions, and subsequently, vaccine initiation. Additionally, future research should further examine the relationship between HPV-related knowledge and intentions to vaccinate to elucidate this inverse relationship in underrepresented racial groups.

FACTORS THAT INFLUENCE CERVICAL CANCER SCREENING UPTAKE AMONG LESBIAN AND BISEXUAL WOMEN AND TRANSGENDER MEN

Michael Johnson, Ph.D., RN

University of Nevada, Las Vegas, Henderson, NV

The purposes of this study were to measure the prevalence of, and identify factors associated with, cervical cancer screening uptake among a sample of lesbian, bisexual and queer (LBQ) women, and transgender men. Past research has found that LBQ women underutilize cervical screening services, and because deficient screening remains the most significant risk factor for cervical cancer, it is essential to understand the differences between routine (Pap test < 3 years) and non-routine (Pap test > 3 years) screeners. The widely used health care utilization framework, Andersen’s Behavioral Model of Health Services Use (BMHSU), was used as a structure to mix the data sets and contextualize the results. It was chosen because it accounts for the different levels of determinants. Participants for this convergent-parallel mixed methods study were conveniently recruited from the Internet and community events from August to December 2014. To be included, participants had to be female or transgender male, age 21-65 years and identify with a sexual orientation other than heterosexual. Quantitative data were collected via a 48-item Internet questionnaire, and qualitative data were collected through in-depth interviews. The quantitative and qualitative data were analyzed separately and then mixed. Quantitative data analyses entailed four steps: 1) screening the data and reporting descriptive statistics for the observed cases, 2) multiple imputations, 3) bivariate analyses, and 4) multivariate logistic regression. Qualitative data were analyzed using deductive-inductive content analysis. Finally, a matrix approach was used to compare the quantitative and qualitative results. Seventy-three percent of the participants received routine cervical cancer screening. Twenty factors were found to be statistically significantly different between routine and non-routine screeners. Eighteen themes/factors were found in the qualitative data. Factors triangulated during the mixed analyses if they were statistically significant and identified in the qualitative data. Routine screeners reported feeling more welcome in the health care setting, while non-routine screeners reported more discrimination related to their sexual orientation and gender expression. Routine screeners were also more likely to be 'out' to their provider. Many of the factors identified in this study related to the healthcare environment and to interactions between the patient and provider. The factors found in the quantitative and qualitative data have implications for research and practice around cancer prevention for LBQ women and transgender men. The factors that contrasted between the quantitative and qualitative data sets are signals for additional research.

FEAR OF PALLIATIVE CARE IN YOUNGER ADULTS WITH CANCER: AN INDIRECT EFFECT OF DEPRESSION SYMPTOM SEVERITY

Ashley Beggin, N/A[1], Laura M. Perry, BS[2], Michael Hoerger, PhD, MSCR[1]

[1]Tulane University, New Orleans, LA; [2]Tulane University, New Orlenas, LA

Title: Fear of Palliative Care in Younger Adults with Cancer: An Indirect Effect of Depression Symptom Severity

Objectives: Drawing upon socioemotional selectivity theory, this study examined differences in fear of palliative care consultations based on age and depression symptom severity. Increased knowledge about how different age groups view palliative care could help inform tailored interventions in the future.

Methods: The sample of 598 participants was drawn from Project EMPOWER, an internet based palliative care educational intervention study. Participants had no prior palliative care consultations and were adults with cancer in current oncological care. The sample was heterogeneous in terms of caner type, had an age range of 27 to 93 years old, and was 42.8% female. Participants completed self-report measures of their health history, depression symptom severity (PROMIS), and fear of palliative care (Palliative Care Preference Scale – emotion subscale). Hierarchical regression was used to determine how baseline palliative care preferences varied based on age.

Results: Results indicated that younger age was associated with greater fear of palliative care consultations ($p < .01$). This association was mediated by depression symptom severity.

Discussion: Younger participants indicated greater fear of palliative care consultations, potentially due to elevated levels of depression symptoms. Future studies should examine whether educating patients about the impact of mood on preferences reduces barriers to palliative care utilization.

FEASIBILITY OF A PHYSICAL ACTIVITY INDEX IN CLINICAL PRACTICE: PERSPECTIVES OF PROVIDERS AND CANCER SURVIVORS

Shirley M. Bluethmann, PhD, MPH[1], Sarah Keadle, PhD, MPH[2], Charles Matthews, PhD[1], James McClain, PhD, MPH[1], Frank Perna, EdD, PhD[1]

[1]National Cancer Institute, Rockville, MD; [2]Cal Poly, San Luis Obispo, CA

Background: Physical activity (PA) is a well established behavioral recommendation for older adults and has specific benefits for cancer survivors. However, most older adults and survivors do not meet PA recommendations. Clinical tools are being sought to help counsel these increasingly intersecting groups, but the feasibility of these tools in clinical practice is not well understood. We developed an integrated Physical Activity Index (PAI) that synthesizes physical and behavioral components to assist with this task. The purpose of this project was to conduct interviews to assess the feasibility and clinical utility of the PAI from both provider and patient perspectives.

Methods: We recruited 18 participants from the Washington, DC area (9 providers, 9 post-treatment cancer survivors) for one-on-one, in-person interviews. Providers were purposively sampled to include a mix of practice settings (e.g., primary care and oncology). Eligible providers reported seeing survivors “regularly”; eligible survivors had completed treatment within the last 5 years. Interviews were recorded and transcribed verbatim. An interview guide and interviewer training ensured consistently in interview procedures. Segmented coding procedures tracked responses to specific PAI elements (i.e., cognitive assessment). Thematic coding synthesized qualitative data to assess barriers and feasibility of implementing the PAI in clinical practice.

Results: Five oncology providers (including 2 nurses) and 4 primary care providers (including 2 nurses) were interviewed. Patient participants included 5 prostate and 4 breast cancer survivors with a mean age of 69 yrs (range 55-79 yrs) and mean time of 4 years post treatment. Most providers were receptive to the PAI as a brief screener and liked the idea of report-card style output to track and counsel patients on lifestyle changes, especially if this could be linked to electronic medical records (EMR). Most survivors had received a provider recommendation to exercise, but liked the idea of creating customized exercise goals and partnering with providers to achieve them. For barriers, providers worried about having time to explain the tool and output to patients, a concern also shared by many survivors. Some survivors mentioned symptoms and chronic conditions as potential barriers to lifestyle

changes.

Conclusion: The PAI could be a feasible tool in clinical practice, for providers and survivors, especially if the tool could be integrated with the EMR to assist providers and patients in pursuing PA recommendations. Supplementary provider education resources on patient counseling would facilitate use of the PAI in primary care and oncology practices. Survivors may need additional support from the medical team to adapt PA goals based on individual health concerns, especially older survivors or those with multi-morbidities.

FORGIVENESS AS A BUFFER TO LUNG CANCER STIGMA

Kristen E. Riley, Ph.D. [1], Heidi Hamann, PhD[2], Megan Shen, PhD[3], Anna J. Thomas, Ph.D.[4], Jamie S. Ostroff, Ph.D.[1]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]University of Arizona, Tucson, AZ; [3]Weill Cornell Medicine, New York, NY; [4]Baylor University Medical Center, Dallas, TX

The majority of individuals diagnosed with lung cancer report experiencing stigma, such as perceiving that they are responsible and/or deserving of lung cancer. Stigma is associated with a number of deleterious psychosocial and medical outcomes in lung cancer patients, including delayed medical help-seeking, increased psychosocial distress, lower quality of life, and poorer provider communication. As such, a better understanding of modifiable targets for development of stigma-reducing interventions are needed. Forgiveness, or resolving emotional and cognitive distress through an intraindividual, prosocial change process, has been shown to decrease stigma and buffer individuals from the deleterious effects of stigma broadly. However, forgiveness has never been studied in the context of lung cancer stigma. We aim to examine whether forgiveness provides a buffer to stigma in lung cancer patients in order to guide the development of interventions for better mental and physical wellbeing outcomes in this vulnerable population of cancer survivors.

Method

Lung cancer patients (N = 231) completed a battery of questionnaires assessing demographic information, lung cancer stigma (Lung Cancer Stigma Inventory; Hamann, Shen, Thomas, Craddock Lee, & Ostroff, 2016) and forgiveness (Forgiveness subscale of the Fetzer Multidimensional Measure; Fetzer Institute, 1999; Neff, 2006), as part of a larger study.

Results & Discussion

Internal reliability for the forgiveness subscale in this sample was good (α = .758). Bivariate correlations between forgiveness and lung cancer stigma indicated a statistically significant negative relationship (r = -.211 p < .001). Stepwise regression analyses indicated that forgiveness was a statistically significant correlate of lung cancer stigma, even when accounting for age, gender, race, ethnicity, and education (B = -2.27, p = .008).

It appears as though forgiveness may mitigate lung cancer stigma such that more reported forgiveness of self, God, and others is related to less reported lung cancer-related stigma. Forgiveness may serve as a buffer against experiencing lung cancer stigma, or may protect against the deleterious effects of lung cancer stigma, and may serve as a target for interventions. These preliminary findings must be confirmed in future longitudinal studies.

GENDER ROLE NORMS AND SPIRITUAL PEACE AMONG CHINESE HUSBANDS OF BREAST CANCER SURVIVORS: THE MEDIATING ROLE OF COPING PROCESSES

Nelson Yeung, Ph.D.[1], Lu Guohua, Ph.D[2], Qian Lu, MD, PhD[3]

[1]The Chinese University of Hong Kong, Hong Kong, N/A, Hong Kong; [2]Weifang Medical University, Weifang, Shandong, China (People's Republic); [3]University of Houston, Houston, TX

Studies have found that stress/coping processes are associated with well-being among husbands of breast cancer survivors (BCS). However, little is known about how gender role norms associate with these stress/coping processes, and subsequently affect the husband caregivers' well-being. This study applied the Stress and Coping Model to examine the psychosocial correlates of spiritual peace among Chinese husbands of BCS. Participants (n=176, mean age =54.4) were recruited in Weifang, China. Their individual characteristics (including male gender role norms), caregiving burden, self-efficacy, denial coping, and spiritual peace were measured in a cross-sectional survey.

Path analysis results supported the proposed mediation model, with satisfactory fit indices (χ^2 (5) = 6.79, *p* = .24; CFI = .99, TLI = .99, RMSEA = .045). The "masculinity strength" norm was associated with lower caregiving burden, higher self-efficacy, less denial coping; whereas the "avoid being feminine" norm was associated with higher caregiving burden. Lower caregiving burden was associated with less denial coping and higher self-efficacy, which in turn associated with higher spiritual peace. The model explained 43.2% of the variance in spiritual peace.

Bootstrapping results indicated that both the "masculinity strength" (β= 0.39, 95% CI =0.34, 0.45) and "avoid being feminine" (β= -0.11, 95% CI =-0.16, -0.07) norms had significant indirect effects on spiritual peace, supporting that stress/coping variables (caregiving burden, self-efficacy, and denial coping) mediated between the gender role norms and spiritual peace.

This was the first study exploring how male gender role norms were associated with stress/coping processes and spiritual peace among husbands of Chinese BCS. Interventions that help caregivers reduce caregiving burden, enhance self-efficacy, and encourage the use of adaptive coping strategies may increase their spiritual peace. Regarding gender role norms, supporting men by appreciating their commitment to take good care of their spouses ("masculinity strength" norm) and by reducing their barriers to express tenderness ("avoid being feminine" norm) may help to reduce caregiving burden and improve their well-being.

HEALTH BEHAVIORS AND SUPPORTIVE CARE NEEDS OF LOW-INCOME LATINA BREAST CANCER SURVIVORS

Alix Sleight, OTD, OTR/L

University of Southern California, Los Angeles, CA

Background: Latina breast cancer survivors are disproportionately at risk for poor health outcomes. Supportive care services can promote well-being during cancer survivorship and reduce health disparities. However, little is known about the supportive care needs of low-income Latina breast cancer survivors, particularly as they relate to health behaviors. This pilot study aimed to identify the unique supportive care needs and health behaviors of low-income Latina breast cancer survivors. **Design:** This descriptive study utilized a battery of three self-report questionnaires. **Setting:** Subjects were recruited from the oncology clinic of a major public hospital. Participants were breast cancer survivors (n=102) with no metastasis who had completed surgery, chemotherapy, and radiation. **Outcome Measures**: Three self-report questionnaires: 1) The Supportive Care Needs Survey (SCNS-SF34), a standardized, 34-item survey designed to capture the supportive care needs of cancer survivors. 2) The Health Behaviors and Logistical Challenges Survey, a 31-item measure developed for the purposes of this study to gather supplemental data about lifestyle-related needs. 3) A standard demographics questionnaire. **Results:** All participants self-identified as Latina, with an average age of 54. 77% disclosed an annual income of $15,000 or less. 72% of participants indicated having at least one co-morbidity, most commonly hypertension (38% of participants) and diabetes (31%). Respondents reported, on average, 16 unmet supportive care needs. They indicated the highest level of unmet need in the domain of “health systems and information.“ Items most commonly rated as 5/5 (“high need”) in this domain included "being informed about things you can do to help yourself to get well" and "being given information about aspects of managing your illness and side-effects at home.” The most frequently reported needs related to health behaviors and logistical challenges were “help with everyday management of another health condition” (45% of respondents) and “paying my bills/rent” (48% of participants). Other commonly-reported health behavior challenges included obtaining adequate nighttime sleep and addressing weight loss/maintenance. **Conclusions**: These findings suggest that low-income Latina breast cancer survivors may require more and/or better-tailored health-related information and increased support in self-management of co-morbidities, along with guidance in health behavior change. These findings carry implications for optimizing multidisciplinary supportive care for this population.

B045 6:00 PM-7:00 PM

HEALTHCARE USE AND COST AMONG DEPRESSED AND NON-DEPRESSED CANCER PATIENTS

Gabrielle Decastro, N/A[1], Brent Mausbach, PhD[2]

[1]San Diego State University, La Jolla, CA; [2]University of California San Diego, La Jolla, CA

OBJECTIVE: We examined differences in healthcare costs between depressed and non-depressed cancer patients.

BACKGROUND: Cancer is a disease for which treatment may be both lengthy and costly. The prevalence of depression is significantly higher among individuals with cancer relative to those without. In non-cancer patients, depression has been associated with increased annual healthcare use and cost. Among those with cancer, depression has been associated with increase in annual healthcare visits, increased risk for emergency department visits, and inpatient hospitalizations. However, the link between depression and healthcare costs in those with cancer is less clear. This study investigated whether annual healthcare costs were higher among depressed cancer patients relative to non-depressed cancer patients.

METHODS: A retrospective analysis of UCSD healthcare system administrative data was conducted on 13,194 patients who had an ICD-9 diagnosis of cancer. Of these, 1,624 (12.3%) had an ICD-9 diagnosis consistent with a depressive disorder. GLM with gamma distribution and log link was used to estimate annual healthcare costs for depressed vs non-depressed participants after controlling for participant age, gender, race/ethnicity, comorbid medical conditions, metastasis status, and number of mental health visits. Secondary analyses examined healthcare charges for outpatient visits in depressed and non-depressed participants.

RESULTS: Depressed cancer patients had annual healthcare charges (M ± SE = $15,761 ± $497) that were 61.1% higher than non-depressed cancer patients (M ± SE = $9,690 ± $112). Similarly, outpatient charges for depressed patients were 57.4% higher than non-depressed patients (mean ± SE = $3,307 ± $78 vs $1,915 ± $18, respectively). When mental health charges were excluded from total outpatient charges, costs remained almost identical to those found when mental health costs were included (depressed = $3,102 ± $73; non-depressed = 1904 ± $18), suggesting that increased cost of depression was not due to costs associated with mental health treatment.

CONCLUSIONS: Depressed cancer patients had higher average annual healthcare costs, as well as higher outpatient charges, than non-depressed cancer patients. These data suggest

that depression comorbidity be taken into account when assessing healthcare and treatment options for those with cancer. Future studies should replicate results using standardized diagnostic criteria for depression, determine the impact of severity of depressive symptoms on healthcare costs, and evaluate if change in depression status via psychiatric treatment reduces healthcare costs in depressed cancer patients.

HIGH PREVALENCE OF COMBINATION TANNING AMONG UNDERGRADUATES: SURVEY OF A SOUTHEASTERN U.S. UNIVERSITY

Marcus Tan, MBBS[1], Natalie R. Gassman, PhD[1], Alyssa Fernandez, MPH[2], Sejong Bae, Ph.D.[3], Casey Daniel, PhD, MPH[1]

[1]University of South Alabama Mitchell Cancer Institute, Mobile, AL; [2]USA Mitchell Cancer Institute, Mobile, AL; [3]University of Alabama at Birmingham, Birmingham, AL

Background: Tanning is a common behavior among young adults. While outdoor tanning (OT) is common, indoor tanning (IT) and sunless tanning products (STP) are also utilized. However, little is known about how young adults combine multiple tanning modalities. The objective of this study was to define the prevalence of combination tanning among undergraduates and to identify characteristics distinguishing combination tanners from single-modality tanners. **Methods**: Undergraduate students at a public university in the southeastern United States were invited to complete an online survey about their participation, knowledge, and attitudes regarding OT, IT and STP. Combination tanning was defined as engaging in two or more tanning behaviors. Uni- and multivariate analyses were performed to identify factors associated with combination vs. single-modality tanning. **Results**: 2,668 of 11,015 undergraduates completed the survey (24% response rate). Of these, 1,942 (73%) engaged in tanning behavior(s). There were 726 single modality tanners (38%) and 1,216 combination tanners (62%). Among combination tanners, 772 used two tanning modalities (63%), most commonly OT and IT, whereas 444 used three tanning modalities (OT+IT+STP, 37%). Combination tanners, compared to single-modality tanners, were more likely to be aware of the risks of tanning beds (OR 1.6, 95% CI 1.1-2.4), but also more likely to agree or strongly agree that using a tanning bed is fine if not used too frequently (OR 2.5 (1.7-3.6), 6.4 (3.0-13.9), respectively). Furthermore, combination tanners had greater intention to use IT within the next 12 months (OR 23.7, 95% CI 11.9-47.3). **Conclusions**: The majority of those engaged in tanning behaviors used more than one modality. Combination tanning appears to be an under-recognized phenomenon, with the beliefs and perceptions of this population not well-studied. Understanding concurrent tanning behaviors may be important in order to develop effective interventions.

HOW ARE MULTIFACTORIAL BELIEFS ABOUT CANCER CAUSATION ASSOCIATED WITH RISK PERCEPTIONS, CANCER COGNITIONS, AND WORRY IN THE US?

Jada G. Hamilton, Ph.D., M.P.H.[1], Erika A. Waters, Ph.D., M.P.H.[2]

[1]Memorial Sloan Kettering Cancer Center, New York, NY; [2]Washington University in St. Louis, St. Louis, MO

Background: Cancer, like many common health conditions, is caused by a combination of genetic, behavioral, and environmental factors. Understanding this multifactorial nature of cancer etiology is a critical component of genomic health literacy. Our past work has demonstrated that multifactorial beliefs about cancer causation are common in the U.S. (endorsed by 64.3%), and that endorsement of multifactorial beliefs is associated with some cancer screening behaviors. However, it is unclear whether these multifactorial causal beliefs are associated with other cognitive and affective variables that theory and research have identified as contributors to the adoption of health behaviors.

Methods: Using nationally representative cross-sectional data from the U.S. Health Information National Trends Survey (N=2,756), we examined whether endorsing a multifactorial model of cancer causation (operationalized as simultaneous endorsement of genetic and behavioral causal beliefs) was associated with perceptions of risk, cancer cognitions, and worry about toxic environmental exposures.

Results: Multivariable linear regression analyses adjusted for demographics and health history indicated that multifactorial beliefs were associated with higher absolute ($b = 0.18$, $p = 0.01$) and affective perceived cancer risk ($b = 0.10$, $p = 0.05$), more worry about ingested ($b = 0.21$, $p = 0.002$) and emanating ($b = 0.17$, $p = 0.01$) environmental exposures, and with more agreement that cancer can be prevented ($b = 0.24$, $p < 0.001$). Multifactorial beliefs were not associated with comparative perceived cancer risk or with believing that there are too many cancer recommendations to follow and that everything causes cancer.

Conclusions: Multifactorial causal beliefs are associated with cognitive and affective factors that drive healthy behaviors. Specifically, multifactorial beliefs about cancer etiology are related to personal understanding of disease risk, the possibility of preventing cancer, and worries about toxic environmental exposures. These findings highlight possible mechanisms by which multifactorial beliefs may support healthy behaviors. They can also inform the development of health communication efforts that aim to translate basic genomics research into clinical and public health practice.

IMPACT OF A MULTIMEDIA INTERVENTION ON TREATMENT DECISION MAKING AMONG PROSTATE CANCER PATIENTS: A NATIONWIDE TRIAL

Michael A. Diefenbach, Ph.D.[1], Catherine Benedict, PhD[2], Suzanne M. Miller, PhD[3], Linda Fleisher, PhD, MPH[4], Annette L. Stanton, Ph.D.[5], Sara Fleszar, N/A[1], Gianna M. Torre, BA[1], Mary Ropka, Ph.D.[6], Kuang-Yi Wen, PhD[7]

[1]Northwell Health, Manhasset, NY; [2]Hofstra Northwell School of Medicine, Manhassat, NY; [3]Fox Chase Cancer Center/Temple University Health System, Philadelphia, PA; [4]Children's Hospital of Philadelphia, Philadelphia, PA; [5]UCLA, Los Angeles, CA; [6]UVA School of Medicine, Charlottesville, VA; [7]Fox Chase Cancer Center, Cheltenham, PA

Introduction: Men diagnosed with early stage prostate cancer (PC) face multiple treatment options, each with distinctive side effects that have significant implications for post-treatment quality of life. “Healing Choices for Men with Prostate Cancer” is a multimedia educational and decision aid program designed to support patients’ personalized treatment decision making. This nation-wide randomized controlled trial evaluated the impact of the Healing Choices program on decision variables.

Methods: Eligible cancer patients who called the National Cancer Institute’s Cancer Information Service (CIS) were invited to participate. Participants completed a baseline interview and were randomized to either a usual service call with a CIS information specialist (comparison condition), or CIS standard consultation plus the Healing Choices program (intervention condition). Follow-up interviews were conducted at 2-months post-enrollment. Decisional conflict and psychological distress about PC treatment were assessed using the Decision Conflict Scale and the Impact of Event Scale respectively. Group differences at 2 months post-randomization were tested using the intent-to-treat principle. Hypothesized moderation effects of demographic and clinical characteristics were evaluated.

Results: 440 participants were randomized to the intervention (n=221) or comparison (n=219) conditions. The sample was on average 64 years old, primarily White and well-educated. Intervention effects were not significant on total decisional conflict (t[312]=1.13, ns) or psychological distress (t[338]=-.48, ns). However, evaluation of specific aspects of decision processes indicated a significant effect on levels of perceived decisional support (t[339]=2.01, $p < .05$. The intervention effect was greates for non-White minority participants (b=10.19, SE=4.36) and those with lower educational attainment (b-3.87, SE=2.21).

Conclusions: This interactive, comprehensive education and decision aid program may be most effective for a subset of patients at risk for unmet needs and decisional conflicts. It is therefore critical to be able to identify at-risk patients in need of decision support services. Future work should determine the best ways to leverage this technology to provide tailored interventions with the greatest reach.

IMPACT OF DIAGNOSIS ON HEALTH BEHAVIORS OF BREAST CANCER SURVIVORS AND THEIR PARTNERS: A QUALITATIVE STUDY

Caroline Dorfman, Ph.D.[1], Tamara Somers, Ph.D.[1], Rebecca Shelby, Ph.D.[1], Gretchen Kimmick, MD, MS[1], Linda Craighead, PhD[2], Francis Keefe, Ph.D.[1]

[1]Duke University Medical Center, Durham, NC; [2]Emory University, Atlanta, GA

Obese breast cancer survivors are at increased risk of disease progression, recurrence, and death. The stress and responsibility faced by caregiving partners may also result in weight gain, unhealthy eating, and inactivity putting them at risk for poor health outcomes. Given the strong concordance of health practices of couples, we conducted a qualitative study of breast cancer survivors and their partners to better understand weight-related behaviors among dyads. Focus groups were held with obese breast cancer survivors (n=14) and their overweight/obese partners (n=14). Participants provided information about changes in weight and factors impacting health behaviors following diagnosis and treatment. Field notes and audio recordings were reviewed; relevant themes were identified. Couples were married (93%) and had been together for *M*=27 years (*SD*=14.6). The average BMI was 33.1 (*SD*=2.7) for survivors and 30.6 (*SD*=3.5) for partners. The majority of survivors were diagnosed with 2 other medical comorbidities, and 57% of partners reported 2 or more health conditions; hypertension and pain-related conditions (e.g., osteoarthritis) were most common. Weight gain following diagnosis was common, and weight loss was difficult. Couples endorsed fatigue, change in taste making high fat/sugar foods more palatable, and increased eating outside the home as challenges to weight management. Survivors and partners reported a link between emotions and eating behaviors, describing food as a source of comfort. Couples shared in the experience of eating for comfort with one partner describing him and his wife as “partners in crime.” Couples provided information about barriers to activity. Survivors noted that their physical activity was limited by joint stiffness, pain, and fatigue. For some partners, side effects from medical conditions affected their activity level. Behavioral weight loss interventions for cancer survivors have not typically involved partners and rarely address physical and psychological symptoms related to poor eating and inactivity. Qualitative data suggest that a dyadic behavioral weight loss intervention that includes symptom management strategies may improve weight management and health behaviors for couples during cancer survivorship.

IMPACT OF HEALTH LITERACY AND PATIENT ACTIVATION ON USE OF PROSTATE CANCER AND COPING WEBSITE INTERVENTION

Alicja Bator, MPH[1], Erin K. Tagai, PhD, MPH[2], Suzanne M. Miller, PhD[3], Michael A. Diefenbach, Ph.D.[4], Sara Fleszar, N/A[4], Stefanie Garner, B.S.[5], Gianna M. [1]Rutgers University - Robert Wood Johnson Medical School, New Brunswick, NJ; [2]Fox Chase Cancer Center, Philadelphia, PA; [3]Fox Chase Cancer Center/Temple University Health System, Philadelphia, PA; [4]Northwell Health, Manhasset, NY; [5]Fox Chase Cancer Center/ Temple University Health Center, Philadelphia, PA; [6]Northwell Health, Providence, RI; [7]Fox Chase Cancer Center at Temple University Hospital, Philadelphia, PA; [8]Lewis Katz School of Medicine/Temple University Hospital, Philadelphia, PA; [9]Rutgers Robert Wood Johnson Medical School, New Brunswick, NJ, New Brunswick, NJ

Background: Patient activation and health literacy are important indicators of self-management and health seeking behaviors. We examined their impact on patient use of an interactive web-based multimedia program (PROGRESS) that is theoretically guided by the Cognitive-Social Health Information Processing Model (C-SHIP) to help prostate cancer patients with self-management after treatment.

Methods: The PROGRESS website intervention for prostate cancer patients focused on common concerns (e.g., communication, emotional and body-image issues, managing treatment side effects) and provided training tools and tips to promote coping and reduce disruption of daily activities. Prostate cancer patients (n=186) within six months of treatment were given access to the PROGRESS website. Health literacy was measured using a three-item health literacy screening tool designed by Chew et al. Patient activation was measured using the patient activation measure (PAM-13) scale. Descriptive statistics were used to summarize website usage, health literacy, patient activation and demographics such as race, age, household income, marital status, and education. Chi-square and ANOVA were used to determine bivariate associations. Logistic regression was used to analyze multiple predictors of website use.

Results: High health literacy levels (mean=4.36, *SD*=0.76) and high patient activation (55%=high compared with 6%=low) were observed. Bivariate analyses reported patients with higher levels of health literacy were more likely to access and use the website (r=0.22, *p*

Discussion: Data suggests that patients with high literacy are more likely to find the website intervention useful. Findings also suggest participants with greater health literacy scores have greater patient activation. Future research is needed to better understand the relationships between health literacy, patient activation, and other predictors of use of interactive educational websites tools for prostate cancer and other patient populations.

INTRA- AND INTERPERSONAL FACTORS THAT MAY INFLUENCE GENETIC COUNSELING AMONG HIGH RISK BREAST CANCER SURVIVORS

Maija Reblin, PhD[1], Monica Kasting, PhD[1], Kelli Nam, MPH[1], Courtney L. Scherr, PhD[2], Jongphil Kim, PhD[1], Ram Thapa, PhD[1], Cathy Meade, PhD, RN, FAAN[1], M. Catherine Lee, MD FACS[1], Tuya Pal, MD[1], Gwendolyn Quinn, Ph.D. [3], Susan Vadaparampil, PhD MPH[1]

[1]Moffitt Cancer Center, Tampa, FL; [2]Northwestern University, Chicago, IL; [3]Moffitt Cancer Center - USF, Tampa, FL

Purpose: Many survivors at increased risk for hereditary breast cancer (BC) do not receive genetic counseling (GC) and/or testing. We evaluated intra- and interpersonal factors predicting survivor readiness to engage in GC.

Methods: BC survivors meeting National Comprehensive Cancer Network criteria for referral to GC were recruited using clinic and community based approaches. After consent, participants responded to items based on the Health Belief Model assessing intrapersonal (perceived risk, susceptibility, severity, worry and impact of BC, benefits and barriers to GC, self-efficacy, and decisional conflict), interpersonal-provider (provider encouragement of GC), and interpersonal-family (cancer family history, family encouragement of testing) factors and demographic items. Participants also reported whether they planned to make a GC appointment, and drawing from the Transtheoretical Model of Behavior Change, were categorized by pre-contemplation (did not plan to make an appointment) and contemplation (did plan to make an appointment in the next 1-6 months) status. We used X^2 and t-tests to compare pre-contemplators and contemplators on intra- and interpersonal factors.

Results: Of 111 participants analyzed, 48 (43%) were contemplators and 63 (67%) were pre-contemplators. Compared to pre-contemplators, contemplators were younger (M=61 vs 65, p=.04), but there were no other significant demographic differences. Contemplators reported higher perceived susceptibility and severity, and more worry and intrusiveness related to BC (ps

Conclusions: Our results suggest that intrapersonal factors may be more important than interpersonal factors in predicting whether at-risk BC survivors seek GC. However, families of pre-contemplative survivors may recognize their reticence and offer more explicit encouragement for testing. Findings suggest potentially modifiable targets to improve rates of GC in high risk BC survivors.

PREDICTORS OF ADHERENCE TO AEROBIC EXERCISE IN RECTAL CANCER PATIENTS DURING AND AFTER NEOADJUVANT CHEMORADIOTHERAPY

Andria Morielli, MSc[1], Normand Boulé, PhD[1], Nawaid Usmani, MD[2], Kurian Joseph, MD[2], Keith Tankel, MD[2], Diane Severin, MD[2], Kerry S. Courneya, PhD[1]

[1]University of Alberta, Edmonton, AB, Canada; [2]Cross Cancer Institute, Edmonton, AB, Canada

Background: Treatment for locally advanced rectal cancer includes 5-6 weeks of neoadjuvant chemoradiotherapy (NACRT) followed by surgery 6-8 weeks later. Unfortunately, NACRT is associated with side effects including fatigue, diarrhea, and physical deconditioning. Preliminary evidence suggests that aerobic exercise may improve cardiorespiratory fitness in rectal cancer patients during and after neoadjuvant chemoradiotherapy (NACRT), however, adherence to exercise is a challenge in this clinical setting. **Objective:** To explore the predictors of adherence to supervised aerobic exercise during NACRT and unsupervised aerobic exercise after NACRT in rectal cancer patients. **Methods:** Rectal cancer patients (N=18) scheduled to receive NACRT followed by definitive surgery were recruited from the Cross Cancer Institute in Edmonton, Alberta. The exercise program consisted of 3 supervised moderate-intensity aerobic exercise sessions/week during NACRT followed by ≥150 minutes/week of unsupervised moderate-intensity aerobic exercise after NACRT. Demographic, health, psychosocial, and motivational variables were assessed pre- and post-NACRT.. **Results:** For the patients included in the current analysis, adherence to the supervised exercise sessions during NACRT was 77% (SD = 19%, n = 17) and the mean number of aerobic exercise minutes per week post-NACRT was 160 (SD = 67 minutes, n = 13). Although not statistically significant, adherence to supervised exercise during NACRT was meaningfully better for patients who were women (*d*= 0.82; p=0.12), younger (*d*=-0.62; p=0.30), married (*d*=0.62; p=0.42), with better mental health (*r*=0.32; p=0.21), fewer diarrhea symptoms (*r*=0.48; p=0.052), and higher anticipated enjoyment (*r*=0.31; p=0.23), support (*r*=0.32; p=0.22), and motivation (*r*=0.31; p=0.23). After NACRT, adherence to unsupervised exercise was significantly better for patients who reported worse mental health (*r*= -0.56, p=0.046) and meaningfully better for patients who were women (*d*= 0.54; p=0.38), better educated (*d*= 0.77; p=0.22), had no comorbidities (*d*=-0.63; p=0.17), and were aerobic exercisers at baseline (*d*=1.05; p=0.12). **Conclusions:** This pilot study suggests that demographics, tumor side effects, and motivational variables may predict adherence to supervised exercise during NACRT. Predictors of adherence to unsupervised exercise after NACRT may differ and be influenced by treatment response.

SMOKERS’ ATTITUDES TOWARDS CONTINUED SMOKING AFTER A NEGATIVE CT RESULT & LATER TOBACCO USE IN A LUNG CANCER SCREENING POPULATION

Sarah Lillie, PhD, MPH[1], Anne Melzer, MD[2], Angela Fabbrini, MPH[2], Kathryn Rice, MD[2], Barbara Clothier, MA[1], Melissa Partin, PhD[1], Steven Fu, MD[1]

[1]Minneapolis VA Center for Chronic Disease Outcomes Research, Minneapolis, MN;
[2]Minneapolis VA Division of Pulmonology, Minneapolis, MN

Background: Low-dose computed tomography (LDCT) for lung cancer screening decreases lung cancer mortality and offers a “teachable moment” to deliver smoking cessation treatment. However, there is concern that patients given negative results may believe they are no longer at risk of cancer and will continue to smoke - the health certificate effect.
Methods: We surveyed Veterans 3 mo. after screening invitation as part of a larger lung cancer screening evaluation. Survey respondents were asked how strongly they agreed or disagreed with the statement ‘If I had a normal CT scan result, I could continue to smoke without worry’. We dichotomized responses strongly disagree/disagree (i.e., worried about continued smoking) vs neutral/agree/strongly agree (i.e., not worried about continued smoking). Current smokers at invitation (45% of original sample) completing the item were included in analyses (N=263).We assessed smoking status 6 mo. later (N=217) and collected LDCT completion and results (negative result; abnormal result) from medical records. We evaluated bivariate associations between the reported worry of continued smoking post-negative LDCT, sociodemographics, and subsequent smoking status.
Results: Respondents were mostly male (94%) and white (87%). Overall, 46% were not worried about continued smoking after a negative LDCT result. Not worrying about continued smoking varied by age group, with older smokers (age ≥ 65) reporting this view more often than younger smokers (56% vs 37%, X^2=9.16; $P < 0.01$). Compared to those who worried about smoking post-negative LDCT, a higher proportion of respondents who were not worried about continued smoking later reported smoking everyday, and a lower proportion smoked some days or not at all (X^2=7.57; $P < 0.05$). Forty-eight Veterans completed LDCT; 13 received normal and 35 abnormal results, of which 2 required further diagnostic evaluation. Though the sample was too small for formal analyses, 100% of Veterans who were not worried about continued smoking on the survey and actually received a negative LDCT result later reported smoking daily at follow up.
Discussion: Nearly half of respondents reported that they would not be worried about continued smoking after a negative LDCT result, and this attitude was associated with actual tobacco use. This suggests that the health certificate effect is present in lung cancer screening,

particularly among older smokers. Successful lung cancer screening implementation will require evidence-based smoking cessation treatment and addressing patients’ views towards continued smoking post-negative LDCT.

Nisotel, B.A.[4], James MacDonald, B.A.[5], J Buzaglo, PhD[6], Inga T. Lennes, M.D[1], Steven A. Safren, PhD[7], William F. Pirl, M.D., MPH[8], Jennifer S. Temel, MD[1], Joseph A. Greer, PhD[1]

[1]Massachusetts General Hospital Cancer Center/Harvard Medical School, Boston, MA; [2]University of Colorado Anschutz Medical Campus, Aurora, CO; [3]University of Colorado, Boulder, Department of Psychology, Boulder, CO; [4]Harvard T.H. Chan School of Public Health, Boston, MA; [5]University of California, Los Angeles, Department of Psychology, Los Angeles, CA; [6]Cancer Support Community, Washington, DC; [7]Department of Psychology, University of Miami, Coral Gables, FL; [8]Sylvester Cancer Center, University of Miami Miller School of Medicine, Miami, FL

Background: Oral chemotherapies are increasingly utilized in oncology care. However, patients on these regimens lack close monitoring with regard to adherence, side effects, and toxicities. Data are lacking regarding the types of physical and psychological symptoms patients experience. Little is known about patients' quality of life (QOL) and factors associated with QOL during treatment.

Methods: From 12/2014–8/2016, adult patients with solid and hematologic malignancies prescribed oral chemotherapy were enrolled in a randomized controlled study of adherence and symptom management at the Massachusetts General Hospital Cancer Center. Patients reported sociodemographic information and completed baseline assessments of QOL (FACT-G), symptom severity (MDASI), depression and anxiety (HADS), fatigue (BFI), satisfaction with social support (MSPSS), and satisfaction with providers and treatment (FACIT-TS-PS). Prevalence of symptoms and relationships among these constructs were examined using measures of central tendency, proportions, Pearson product-moment correlations, and multivariate linear regression.

Results: Patients (N=174) commonly reported fatigue (88.7%), pain (44.6%), and nausea (37.6%). Higher QOL (M=81.66, SD=15.13) was associated with lower depressive and anxiety symptoms, lower fatigue, better social support, and higher satisfaction with providers and treatment (ps < .001). Having children was associated with lower QOL (r=-0.19, p=.013). In a

multivariate regression model, each factor was associated with QOL above the effects of others; ($F[6,157]=67.13$, $p < .001$, adj. $R^2=.71$).

Conclusions: Findings elucidate common symptoms and correlates of QOL in patients prescribed oral chemotherapy. Data suggest the potential value of addressing symptoms and psychosocial targets for interventions to enhance patients' QOL.

TRAJECTORIES OF CANCER-SPECIFIC DISTRESS OF INDIVIDUALS WITH PROSTATE CANCER AND THEIR PARTNERS

Kevin R. Criswell, PhD[1], Sharon L. Manne, PhD[2]

[1]Rutgers Cancer Institute of New Jersey, Edison, NJ; [2]Rutgers Cancer Institute of New Jersey, New Brunswick, NJ

Introduction: The prostate cancer experience affects both prostate cancer (PCA) survivors and their partners. Although existing observational longitudinal studies of cancer-specific distress differ regarding the trajectories of distress they report, there have been no studies to date that have reported whether different trajectories of distress may emerge from the same sample of PCA survivors and their partners. The current study sought to characterize cancer-specific distress trajectories for PCA survivors and their partners and to determine predictors of trajectories.

Method: The current study analyzed data spanning 26 weeks across four time points from PCA survivors (n = 79) and their partners (n = 79) within the usual care arm of a clinical trial for an intimacy-enhancing intervention (NIH CA140297). Growth mixture modeling was utilized so as to extract trajectory classes of cancer-specific distress for survivors and their partners, separately. Logistic regression models were run to determine baseline univariate and multivariate predictors of class membership.

Results: Two-class linear models of cancer-specific distress emerged for both PCA survivors (high-high, low-low) and their partners (high-low, low-low). The high-high and low-low classes began at high and low levels, respectively, and remained at those levels. The high-low class began at a high level that decreased over time. Univariate predictors included age, bowel function, psychological distress, psychological wellbeing, intimacy, concern, and masculine self-esteem for survivors (ps < .05). Univariate predictors included mutual avoidance, holding back concern, concern, general psychological distress, and psychological wellbeing for partners (ps < .05). Significant multivariate predictors of class membership included bowel function and general psychological distress for survivors and concern and general psychological distress for partners (ps < .05). Multivariate models correctly classified 83.3% and 78.7% of survivors and partners, respectively.

Discussion: The data suggest that discreet trajectories of cancer-specific distress exist for both PCA survivors and their partners. Future studies should demonstrate whether the extracted trajectories and their predictors are generalizable to other samples. Healthcare professionals

should consider cancer-specific distress screening for PCA survivors with poor bowel function as they may benefit from psychopharmacological or psychosocial interventions.

ANXIETY SENSITIVITY IN SMOKERS WITH INDICATORS OF CARDIOVASCULAR DISEASE

Samantha Farris, Ph.D.[1], Ana Abrantes, Ph.D.[2]

[1]Alpert Medical School of Brown University, Providence, RI; [2]Butler Hospital/Alpert Medical School of Brown University, Providence, RI

There is growing recognition of the importance of understanding the nature of the associations between anxiety and cardiovascular disease (CVD), although limited research has examined mechanisms that may explain the anxiety-CVD link. Anxiety sensitivity (fear of anxiety-relevant somatic sensations) is a cognitive-affective risk factor implicated in the development of anxiety psychopathology and various behavioral risk factors for CVD, although has not been examined among individuals with CVD. Adult daily smokers (n = 619; 50.9% female; Mage = 44.0, SD = 13.67) completed an online survey that included the Anxiety Sensitivity Index-3 (ASI-3) and the Patient Health Questionnaire (PHQ). The presence of CVD indicators was assessed via the presence of ≥ 1 of the follow: heart attack, heart murmur, positive stress test, heart valve abnormality, angina, and heart failure. Smokers with CVD indicators (n = 66, 10.7%) had significantly higher scores on the ASI-3 (M = 33.5, SD = 22.15), relative to smokers without CVD (M = 22.0, SD = 17.92; Cohen' s d = .57). Physical and social concerns about the meaning of somatic sensations were common among smokers with CVD. Mediational analyses indicated that anxiety sensitivity indirectly accounted for the association between (a) anxiety psychopathology and likelihood of CVD, and (b) CVD and likelihood of anxiety psychopathology. While these findings are preliminary and warrant replication in future prospective studies, anxiety sensitivity is a potentially novel psychological mechanism that plays a facilitatory role in bidirectional associations between anxiety psychopathology and CVD.

HOW MANY US CITIZENS ARE AT RISK FOR HEART DISEASE? FINDINGS FROM THE NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEY, 1999-2014

Haley Moss, MPH Candidate[1], Kaigang Li, PhD[2]

[1]Colorado School of Public Health, Fort Collins, CO; [2]Colorado State University, Fort Collins, CO

Background: Cardiovascular Disease (CVD) is the leading cause of death worldwide, costs billions of dollars in healthcare spending each year, and affects people of all ethnicities, ages, and geographic locations. With the increasing age of the U.S. population and the obesity epidemic, CVD related morbidity and mortality is likely to increase in prevalence in the future. Early prediction of individual risk may aid in reversing this trend.

Purpose: Assess the 10-year atherosclerotic CVD (ASCVD) risk of the U.S. population aged 40-79 years utilizing the newly developed, race-and sex-specific Pooled Cohort Equations for non-Hispanic White and African-American men and women from the American College of Cardiology (ACC) and the American Heart Association (AHA).

Methods: Using data from the 1999-2014 National Health and Nutritional Examination Survey, 10-year ASCVD risk scores were calculated using stepwise addition of the provided equation parameters for 11,553 participants. After calculating the total, the percent risk was calculated using 1-(baseline survival rate)^e^(total-overall mean). Both baseline survival rate and overall mean were provided by the ACC/AHA. We then sorted scores into categories of less than 5%, 5-10%, and greater than 10% risk. The analyses were conducted using SAS 9.4 program and accounted for complex survey design.

Results: Of all participants, 57.66% (weighted % hereafter, 95% confidence interval [CI]: 55.89 – 59.43%) had a 10-year ASCVD risk of ≥ 5%. In addition, 20.29% (CI: 18.92-21.66%) had a risk of 5 - 10%, and 22.06% (CI: 20.99-23.12%) had a risk of < 10%. Sex and age disparities were found, with 28.02% males (vs. 15.48% females; Rao-Scott chi-square=1,251.43, df=2, p < .001) and 41.83% of those 55 years and older (vs. 3.28% 50-55, 1.03% 45-50, 0.33% 40-45 year; Rao-Scott chi-square = 11,437.59, df=6, p < .001) had a < 10% risk.

Conclusion and Future Directions: Given the high percentage of individuals with a 10-year ASCVD risk < 10%, steps must be taken to lower individual risk. Previous studies suggest that providing specific diet and exercise guidelines as well as individual and group counseling about healthy eating and exercise behaviors in gender and race specific contexts can aid in creating lasting behavioral changes that lead to lower risk. In addition to the efforts to improve individual CVD risk lowering behaviors, environmental improvements must be emphasized to support individuals in making risk-lowering decisions.

LONELINESS, CARDIOVASCULAR DISEASE, AND DIABETES PREVALENCE IN THE HISPANIC COMMUNITY HEALTH STUDY/STUDY OF LATINOS

Samantha A. Reina, MS[1], Tasneem Khambaty, PhD[1], Orit Birnbaum-Weitzman, PhD[1], William Arguelles, PhD[2], Frank Penedo, PhD[3], Rebeca Espinoza Giacinto, MA/MPH, PhD[4], Angela P. Gutierrez, MS[5], Linda C. Gallo, PhD[6], Aida L. Giachello, PhD[7], Neil Schneiderman, Ph.D.[8], Maria M. Llabre, PhD[1]

[1]University of Miami, Coral Gables, FL; [2]Center for Research and Grants, Baptist Health South Florida, Coral Gables, FL; [3]Northwestern University, Chicago, IL; [4]San Diego State University/UC San Diego, Auburn, CA; [5]SDSU/UC San Diego Joint Doctoral Program in Clinical Psychology, La Jolla, CA; [6]San Diego State University, Chula Vista, CA; [7]University of Illinois at Chicago, Chicago, IL; [8]University of Miami, Miami, FL

Background: Cardiovascular, immune, and nervous system changes have been identified in chronically lonely people. Yet, the relationship between loneliness and prevalence of cardiovascular disease (CVD) and diabetes mellitus (DM) has been understudied in U.S. Hispanics/Latinos, a group at high risk for DM. **Purpose:** We examined whether loneliness was associated with CVD and DM, and whether sex, marital status, and years in U.S moderated these associations. **Methods:** Participants were 5,313 adults ages 18 -74 (M (SD) age = 42.39 (15.01), 54.5% female) enrolled in the Hispanic Community Health Study/Study of Latinos Sociocultural Ancillary Study. Loneliness was assessed via the 3-item Revised UCLA Loneliness Scale. CVD was assessed via self-reported medical history and DM from serum glucose levels, A1C percentage, OGTT findings, and diabetes medication use. **Results:** Although mean level of reported loneliness was low, loneliness adjusted for demographic, disease risk factors (body mass index, smoking) and depression was significantly associated with CVD: OR = 1.10 (CI: 1.01-1.20), $p = .024$ and DM: OR = 1.08 (CI: 1.00 – 1.16), $p = .048$. Each unit increase in the loneliness total score was associated with 10% greater odds of having CVD and 8% greater odds of having DM. Results did not vary among groups defined by sex, marital status or years in the US. **Conclusions:** Results from this large epidemiological study indicate that increased loneliness is associated with higher cardiometabolic disease prevalence beyond depressive symptoms, regardless of sex, marital status, or years living in the U.S. These results raise the possibility that Hispanic/Latino adults experiencing high levels of loneliness may be a subgroup at particularly elevated risk of CVD and DM.

A NEEDS ASSESSMENT OF MIDWESTERN MOTHERS TO BETTER UNDERSTAND MATERNAL MENTAL AND PHYSICAL HEALTH

Kailey Snyder, M.S., Danae Dinkel, Ph.D., Sofia Jawed-Wessel, Ph.D.

University of Nebraska at Omaha, Omaha, NE

Background: Up to 23% of women struggle with depression during pregnancy and few meet nutrition and physical activity recommendations during pregnancy and the postpartum period. Specifically, up to 60% of pregnant women engage in little to no physical activity in a typical week and these numbers do not improve during the postpartum period. In regards to nutrition, few women prior to pregnancy are meeting nutrition recommendations and minimal improvements to nutrition occur during pregnancy. There is a vital need to improve the mental and physical health of mothers. **Purpose:** The purpose of this study was to conduct a needs assessment to assess women's perceptions of their own mental and physical health as well as their desire for additional services. **Methods:** This non-experimental cross-sectional study utilized a 35-question survey completed by pregnant and postpartum women. Data were analyzed using descriptive statistics. **Results:** A total of 527 mothers living within a large Midwestern metropolitan city completed the survey. The majority of mothers were Caucasian (94.2%), employed full-time (54.6%) and had a household income of $50,000-$75,000 (25.6%). When asked about causes of stress, the most common causes reported were exhaustion (53.5%) and financial distress (38.2%). Mothers indicated these components had been often to very bothersome in the past year. Additionally, 47.3% of mothers felt at least somewhat bothered by a lack of access to physical activity and healthy food options. When asked if they felt they were receiving empathy, trust, and love in their life 15.7% reported no. When asked if they would like more information regarding their own mental and physical health 82.2% of mothers said yes primarily through the format of online support groups (58.4%) or in-person workshops/events (48.5%). **Conclusion:** Mothers need greater access to resources related to mental and physical health to improve overall health thus improving the well-being of their family. Future interventions could focus on utilizing free workshops/events that included an education component as well as online resources related to financial planning, mental health, and health behaviors (i.e., healthy eating, physical activity).

EAT MOVE WIN: PILOT RESULTS OF AN ONLINE NUTRITION EDUCATION PROGRAM FOR HIGH SCHOOL STUDENTS

Trina Robertson, M.S., R.D.N[1], Genevieve Dunton, PhD, MPH[2], Jaclyn Maher, PhD[3], Janel Alberts, PhD[4]

[1]Dairy Council of California, Irvine, CA; [2]University of Southern California, Institute for Health Promotion & Disease Prevention, Pasadena, CA; [3]Data Analysis Consultant, Pasadena, CA; [4]Research Consultant, Mission Viejo, CA

Background: Childhood overweight and obesity are major health problems. School-based nutrition education programs can be implemented with relative ease and cost-effectiveness, and disseminate health information to large groups of adolescents through in class activities. *Eat Move Win* delivers information about nutrition and its impact on personal health through issues relevant to adolescents. The program consists of 5 interactive online lessons that inform and empower students to take small steps to improve their eating habits. Students are encouraged to critically reflect on the content, which aligns with the USDA MyPlate, and make SMART goals for behavior change.
Objective: The goal of this research was to conduct a pilot test of *Eat Move Win* to assess preliminary efficacy at changing students' eating behaviors.
Methods: Pilot testing of the five lessons took place in ninth and tenth California classrooms (N = 4) in early Spring 2016. One hundred and sixty students completed a pre-survey before the curriculum was taught and a post-survey immediately after the five lessons. The survey, from the California Department of Public Health, utilizes the School Physical Activity and Nutrition Survey (SPAN) instrument. It measures food consumption, physical activity, and psychosocial factors influencing fruit and vegetable consumption with high school students.
Results: Pilot data indicated a significant positive change in fruit, carrot, milk, yogurt, whole grain bread intake from pre-to post survey (p's < .05). Changes in salad and vegetable consumption were also positive and approached statistical significance (p's < .10). Chi-square tests indicated that participants did not significantly change their breakfast eating habits between the pre- and post-survey, although a small increase was observed. Approximately three-quarters (73.6%) of participants reported consuming breakfast on the pre-assessment, and 79.2% of participants reported consuming breakfast on the post-survey. Physical activity (past 7 days) significantly increased from pre-to post survey (p < .05). Moreover, pilot data indicated small but not statistically significant reductions in the consumption of sports drinks, soda, French fries/chips, and pastries from pre to the post survey.
Conclusion: *Eat Move Win* is an online nutrition curriculum that shows promise for increasing

healthy eating habits and physical activity, and decreasing consumption of unhealthy foods/drinks for high school students.

EFFECTS OF AEROBIC EXERCISE ON COGNITION AND MENTAL HEALTH SYMPTOMS IN CHILDREN WITH ATTENTION-DEFICIT HYPERACTIVITY DISORDER

Catherine L. Davis, PhD[1], Sarah Premji, B.S. [2], Yoon Ji Ahn, BS[3], Celestine Williams, MS[2], Jacob Looney, BS[4], Christopher F. Drescher, PhD[2], Eduardo E. Bustamante, Ph.D.[5]

[1]Georgia Prevention Institute, Pediatrics, Medical College of Georgia, Augusta Univ., Augusta, GA; [2]Augusta University, Augusta, GA; [3]Medical College of Georgia, Augusta University, Augusta, GA; [4]Augusta University, North Augusta, SC; [5]University of Illinois at Chicago, Chicago, IL

PURPOSE: To test the effects of aerobic exercise on cognition and mental health symptoms in children with Attention-Deficit/Hyperactivity Disorder (ADHD); to bring a new level of rigor to this field (diagnosis; randomization; attention to CONSORT); and to calculate effect sizes to inform future trials.

METHODS: 8 children were randomized into exercise (n = 4) or wait list control group (n = 4). Participants were selected based on diagnosis of ADHD (Parent/Teacher Disruptive Behavior Disorders (DBD) Rating Scale, the Impairment Rating Scale (IRS), and Diagnostic Interview Schedule-IV Parent Interview by a child psychologist). The exercise group attended a 4-week, 40-minute daily aerobic exercise program. Independent samples t-tests measured changes over time by group (Hearts & Flowers, Flanker Fish, DBD, IRS, and the Strengths and Difficulties Questionnaire (SDQ)). Cohen’s d assessed effect size.

RESULTS: No significant differences between groups were found. Effect size in Flanker Fish and each of the symptom ratings (DBD, IRS, SDQ) showed large differences between groups.

CONCLUSIONS: Results did not show significant group effects, but large effect sizes suggest we might encounter significant benefits of exercise in a larger study. Limitations include a small sample size, some baseline group differences and the short duration of the intervention.

EXPANDING THE LIVING HEALTHY SUMMER CAMP TO LATINO FAMILIES

Brook E. Harmon, PhD, RD, FAND[1], Brennan K. Berg, PhD[1], Idia B. Thurston, PhD[1], Cardella Leak, MPH[1], Claudio R. Nigg, PhD, FSBM[2], Laura L. Hayman, PhD, RN, FAAN, FAHA[3]

[1]University of Memphis, Memphis, TN; [2]University of Hawaii, Honolulu, HI; [3]University of Massachusetts Boston, Boston, MA

The prevalence of childhood obesity in the US remains high with little recent change. While parent-focused interventions are recommended for modifying obesity-related behaviors among children, participation and retention of parents is a major barrier. This study used a community-based participatory approach to translate a child-focused summer program to families in Memphis, TN. The Living Healthy Summer Camp began in 2010 as a 4-session culinary camp offered through a church in South Carolina, which served a primarily low-resource African-American community. Participants found the camp acceptable as a way of providing nutrition and cooking skills to families. In translating the camp, the study team met with representatives from 10 churches with multi-ethnic congregations. These meetings expanded the camp into a 4 month curriculum that included: weekly mailings of family-focused diet and physical activity (PA) education activities; a week-long camp offering child-focused cooking and PA skill building; 2.5 hour sessions offered to parents 4 times and focused on diet and PA education and skill building. Thirty youth enrolled along with 17 parents. Parents and children completed diet and PA behavior questionnaires and had anthropometrics measured. Parents also completed home environment questionnaires. Baseline data are reported, with measurements being repeated mid and post program. All participants identified as Latino. Children were between 7 and 12 years old (9.4± 1.5), primarily male (70%), and 47% were classified as obese, using age and sex specific growth charts. Parents were on average 32.2±5.1 years old, obese (BMI=31.2±6.5 kg/m^2), female (77%), and received public assistance (65%). Almost half (47%) of children reported eating at a fast food restaurant 1-2 times a week. They also reported eating on average 3.4±2.0 servings/day of fruits and vegetables and spending 3.6±3.0 hours/week in moderate-to-vigorous physical activity. Most children (53%) reported not being involved in meal preparation during the past week and their average cooking ability was 3.8±2.9 on scale of 1 to 10 (highest). Baseline data indicates a population with a high need, and recruitment indicated a high interest, for this type of intervention.

FAMILY STRESS AND PAIN-RELATED DISTRESS IN YOUTH WITH IBD: TARGETS FOR TREATMENT?

Bonney Reed-Knight, PhD[1], Miranda A.L. van Tilburg, PhD[2], Shelby L. Langer, PhD[3], Joan M. Romano, PhD[4], Rona L. Levy, MSW, PhD, MPH[4]

[1]Emory University, Atlanta, GA; [2]University of North Carolina at Chapel Hill, Chapel Hill, NC; [3]Arizona State University, Phoenix, AZ; [4]University of Washington, Seattle, WA

PURPOSE: Abdominal pain is common in pediatric inflammatory bowel diseases (IBD) but physiological causes have not adequately accounted for the pain experience. Pain is a subjective experience and predicts unfavorable outcomes, but it is unclear who is at risk, and who experiences typical adjustment in the face of chronic illness. The present study aimed to examine the role of several factors prior pain research has found to be associated with poor outcomes - life stressors, coping, and depressive symptoms - in pain-related distress in youth with IBD.

METHODS: 183 parents and their children ages 8-18 years old (Mean age=13.75; 47.5% female, 4.3% Hispanic, 88.0% Caucasian) diagnosed with IBD were recruited (68.3% Crohn’s Disease and 31.7% Ulcerative Colitis). Parents completed measures on child pain related distress, family stressors, and child coping, and children completed the Children’s Depression Inventory.

RESULTS: Mediation analysis was conducted using ordinary least squares path analysis. Higher family stress was positively associated with passive coping. Passive coping was positively associated with depressive symptoms ($p < .001$) and pain-related distress ($p < .001$). Depressive symptoms were positively associated with pain-related distress ($p < .05$). Mediated effects were demonstrated by significant indirect effects in the relationship between family stress and pain-related distress through passive coping (point estimate=.03, 95%CI=.01-.04), depressive symptoms (point estimate=.001, 95%CI= .0003-004) and through both passive coping and depressive symptoms sequentially (point estimate=.004, 95%CI=.00-.01). The full model including mediators accounted for 66% of the variance in pain-related distress; family stress alone account for 27% of the variance in pain-related distress.

CONCLUSIONS: Children whose families have experienced greater family stressors reported greater passive coping and depressive symptoms, which each independently were associated

with pain-related distress. These findings suggest that addressing coping and depressive symptoms during treatment may reduce the burden of pain in young IBD patients.

FOOD CRAVING MEDIATES THE RELATIONSHIP BETWEEN EXTERNAL EATING AND EXCESS GESTATIONAL WEIGHT GAIN

Lauren Blau, B.S.[1], Natalia Orloff, M.S.[1], Renee Samuelson, M.D.[2], Julia M. Hormes, Ph.D.[1]

[1]University at Albany, SUNY, Albany, NY; [2]Albany Medical Center, Albany, NY

Excess gestational weight gain (GWG) is a major public health concern and contributes to medical complications in both mother and child. Craving frequency in pregnant women accounts for a considerable portion of the variance in excess GWG (Orloff et al., 2016). Food craving has also been shown to mediate the effect of external eating (i.e., eating in response to environmental cues) on body mass index (BMI) in university students (Burton et al., 2007). This study tested the hypothesis that craving frequency similarly mediates the relationship between externality and excess GWG.

68 pregnant women (mean age=30.47, SD=4.23; average weeks of gestation=24.01, SD=8.91) completed the Dutch Eating Behavior Questionnaire, which measures "emotional" (Cronbach's a=.95), "external" (a=.86), and "restrained" (a=.90) eating styles, and the Food Craving Inventory, which measures frequency of cravings for high fat foods (a=.70), sweets (a=.86), carbohydrates/starches (a=.82), and fast food fats (a=.66). Excess GWG was calculated based on pre-pregnancy BMI and stage of gestation at time of survey completion.

36.9% of participants had gained in excess of the recommended GWG for their stage of gestation. Excess GWG was significantly and positively correlated with "emotional" (*r*=.45, *p*r=.30, *p*=.02), and "restrained" eating (*r*=.31, *p*=02), as well as with reported frequency of cravings for high fat foods (*r*=.42, *p*=.001) and fast food fats (*r*=.29, *p*=.02). Eating styles accounted for 27% of the variance in frequency of cravings for high fat foods [*F*(3,52)=6.44, *p*=.001], with "external" eating emerging as the single significant predictor (β=.41, *p*b=6.06, *p*=.01, 95% C.I.: 1.59, 10.53), as was the regression of "external" eating on frequency of craving for high fat foods (*b*=.37, *p*b=3.67, *p*=.14, 95% C.I.: -1.30, 8.63), suggesting full mediation. A Sobel test approached statistical significance (*z*=1.76, *p*=.08).

Findings are consistent with past research showing that food craving is a mediator of the relationship between externality and BMI, and suggest that interventions focused on coping with external cues and cravings may help pregnant women more effectively manage gestational weight gain.

GARDASIL FOR BOYS AND YOUNG MEN: PARENTS' AND PHYSICIANS' REPORTED BARRIERS TO VACCINE UPTAKE

Kate E. Dibble, M.A.[1], Jessica L. Maksut, M.A.[1], Elizabeth J. Siembida, Ph.D.[2], Keith M. Bellizzi, Ph.D., MPH[1]

[1]University of Connecticut, Storrs, CT; [2]University of Connecticut, Bethesda, MD

Background: The human papillomavirus (HPV) can cause penile, anal, and oropharynx cancers, as well as genital warts among boys and men who are sexually active. Within the United States, the Human Papillomavirus Quadrivalent vaccine, Gardasil$^{(R)}$, was approved for use in boys and young men in 2009; however, despite its documented effectiveness, uptake of the vaccine among this population remains limited.

Methods: In order to better understand the discrepancy between the vaccine’s documented effectiveness and its lack of uptake among boys and young men, we conducted a systematic search of the literature and qualitatively reviewed 10 published studies that focused on barriers to Gardasil$^{(R)}$ uptake and reasons for uptake among boys and young men, as reported by both parents (*n*=5 studies) and physicians (*n*=5 studies).

Results: Parents reported a number of barriers to vaccine uptake, including low awareness of the existence of Gardasil$^{(R)}$ (*n*=4, 80%), its applicability to boys and young men (*n*=4, 80%), and the vaccine’s cost (*n*=2, 40%). Parents were most likely to vaccinate their sons to protect them from cancer (*n*=4, 80%) and protect their sons’ future sexual and romantic partners (*n*=4, 80%). Physicians also reported concerns regarding the cost of the vaccine, specifically in regards to the patient’s healthcare coverage (n=3, 60%), but also reported additional barriers to vaccine uptake, including the lack of physician/parent communication (*n*=4, 80%) and a concern for vaccine efficacy (*n*=3, 60%). Similar to parents, physicians’ primary reasons for promoting the Gardasil$^{(R)}$ vaccine to boys and young men included cancer prevention (*n*=3, 60%) and promotion of sexual health (*n*=3, 60%).

Conclusion: Parents and physicians aware of the Gardasil$^{(R)}$ vaccine reported similar reasons for uptake of the vaccine in boys and young men. However, parents and physicians differed on the main barriers to vaccine uptake. Particularly, many parents were unaware of the Gardasil$^{(R)}$ vaccine and how it might be useful for their sons. Physicians, in contrast, struggled with the doctor-parent relationship and how to engage in conversations regarding the

Gardasil$^{(R)}$ vaccine. Future research needs to establish best practice promotional strategies for Gardasil$^{(R)}$ uptake, and should focus on both parental and physician audiences in order to maximize vaccination uptake.

IMPACT OF PROVIDER SUPPORT SERVICES ON BREASTFEEDING DURATION

Emily D. Fry, Undergraduate Student, Sarah Rhoades-Kerswill, Ph.D., Misty AW Hawkins, Ph.D.

Oklahoma State University, Stillwater, OK

Background: The benefits of breastfeeding for both infants and mothers are well-documented. However, many women struggle to successfully breastfeed – resulting in a call to action to promote and aid in breastfeeding by providing support and services to increase the success of breastfeeding mothers. This support may include lactation consultants inside and outside of the hospital, nurses, doulas, midwives and medical providers (MD/CNP).

Objective: This study examined factors relating to breastfeeding duration, including types of provider support and services. Specifically, the use of lactation consultants, nurses, doulas, midwives, and medical providers on breastfeeding success were explored. It was hypothesized that these support services have a positive effect on breastfeeding duration.

Methods: Snowball sampling was used to recruit participants for the Breastfeeding Opinions, Outcomes, Behaviors, and Services (BOOBS) online survey. The current sample consisted of 1,964 mothers whose first child was born between 2004 and 2014, who had attempted to breastfeed this child, and who answered questions about using providers to aid with breastfeeding efforts.

Results: Of the sample, 61% breastfed for at least 12 months. It was found that breastfeeding support from a lactation consultant outside of a hospital setting ($t(1860)= -4.275$, $p< .05$), a doula ($t(1699)= -7.581$, $p< .05$) or a midwife ($t(1698)= -8.572$, $p< .05$) was associated with longer breastfeeding durations. The greatest difference was seen among women who had support from a doula. These women breastfed for 17 months, almost 4 months longer than those who did not have a doula. Women who received breastfeeding support from a nurse or doctor/nurse practitioner reported shorter breastfeeding durations ($t(1,774) = 4.06$, $p =.01$, $t(1752) = -8.57$, $p < .05$ respectively). This was most notable for women who had seen a doctor/CNP, who breastfed for 12 months, 2 months less than women who did not.

Conclusion: Results indicate that the use of breastfeeding support services, specifically lactation consultants outside of the hospital, doulas, and midwives were associated with longer breastfeeding durations. These findings indicate that implementation and utilization of these breastfeeding support services may be important factors in increasing the likelihood of successful breastfeeding experiences.

INTERVENTIONS TARGETING MEN'S ALCOHOL USE AND FAMILY RELATIONSHIPS IN LOW AND MIDDLE-INCOME COUNTRIES: A SYSTEMATIC REVIEW

Ali Giusto, MA, Eve Puffer, Ph.D.

Duke University, Durham, NC

Problem drinking disproportionally affects men and has disabling psychosocial, behavioral, and physical consequences. These can lead to a cascade of negative effects on men's families, with documented ties to intimate partner violence (IPV) and child maltreatment. These multi-level problems are often exacerbated in contexts with high poverty rates, including low and middle-income countries (LMICs). In societies where strong patriarchal norms place men in positions of power, family-level consequences are often even more pronounced. To understand how these intertwined consequences have been addressed, we conducted a systematic review of the empirical literature on interventions conducted in LMICs targeting men's problem drinking and any family-related outcomes (i.e., parenting, IPV). Cochrane and PRISMA procedures guided the review, and the search was conducted in PsychInfo, PubMed, and Web of science databases. The initial search yielded 1261 publications that were evaluated, with eight studies from four different countries meeting inclusion criteria. Of those, none had the primary goal of improving both drinking and related family-level outcomes; rather these were secondary outcomes for the majority of the interventions, and none directly targeted parent-child relationships. However, half of the studies documented modest improvements on both drinking and couples or family relationship outcomes, supporting the value of combined alcohol and family interventions. Specific strategies emerged as promising across outcomes including behavioral, communication, narrative, and participatory learning; gender-transformative approaches were associated with reduced IPV and more equitable gender norms, and motivational interviewing and behavioral approaches were beneficial for reducing alcohol use. Overall findings highlight the scarcity of interventions addressing men's drinking and its effects on families, particularly in the domain of parenting. However, results point to strategies that, combined with the broader evidence-base on family-based interventions, can guide the development and rigorous evaluation of new combined approaches.

SELF-EFFICACY PREDICTS CHANGE IN HEALTH KNOWLEDGE IN MIDDLE SCHOOL AGE GIRLS

Mary Kate Clennan, B.S.[1], Daniella Carucci, B.A., M.S.[2], Shannon Chiles, M.S[3], Marissa D. Alert, M.S.[1], Qingyun Liu, N/A[1], Sarah Conboy, MA [4], Ayesha Ware, BA[5], Maria Isabel. Leeder, M.A.[6], Sylvia Perez, M.A.[7], Maria M. Llabre, PhD[1], Judy Brown, Emerita[8], Patrice G. Saab, Ph.D.[1]

[1]University of Miami, Coral Gables, FL; [2]University of Miami, Miami, FL; [3]University of Miami, Louisville, KY; [4]NYSCI, Corona, NY; [5]New York Hall of Science, Corona, NY; [6]Patricia and Phillip Frost Museum of Science, -, FL; [7]New York Hall of Science, Queens, NY; [8]Patricia and Phillip Frost Museum of Science, Miami, FL

Introduction:
Health knowledge and self-efficacy are common outcome variables measured in health promotion studies. While motivational theory suggests children with higher general self-efficacy are more motivated to learn information, and, thus, produce higher classroom achievement scores, research on the relationship between *health* self-efficacy and *health* knowledge is virtually nonexistent. The purpose of the current study was to investigate whether baseline self-efficacy predicts change in health knowledge scores following a health promotion intervention.

Methods:
This project investigated the relationship between self-efficacy and health knowledge in 288 middle school age girls of diverse ethnic backgrounds who were enrolled in a 3-week summer camp that emphasized the importance of a healthy lifestyle. Nutrition and physical activity knowledge were quantified as the percent of items correct on a 7-item nutrition knowledge assessment and on a 6-item physical activity knowledge assessment, respectively. The participants also completed two questionnaires assessing their nutrition and physical activity self-efficacy. All measures were taken at baseline and at the end of camp.

Results:
Two multilple regression models were run, a dietary and physical activity model, controlling for baseline knowledge, age, maternal education, ethnicity, and treatment condition. Dietary results suggest that baseline nutrition self-efficacy and the covariates accounted for significant variability in nutritional knowledge score at the end of the program, adjusted R^2 = .286, F (10, 220) = 10.31, p < .001. Results indicate that, controlling for covariates, for every one-point increase in baseline nutrition self-efficacy, week 3 nutritional knowledge score increased by 5.5%, 95% CI [.12, 10.93]. Similarly, the physical activity model results suggest

that baseline physical activity self-efficacy and the covariates accounted for significant variability in physical activity knowledge score at the end of the program, adjusted $R^2 = .305$, $F(10, 221) = 11.23$, $p < .001$. Results indicate that, controlling for covariates, for every one-point increase in average baseline physical activity self-efficacy item score, week 3 physical activity knowledge score increased by 19.03%, 95% CI [4.38, 33.67].

Conclusion:

The results of the present study show that greater gain in health knowledge scores were predicted by higher baseline health self-efficacy. Heath knowledge is important to possess as increased knowledge may lead to positive attitudes toward healthy behaviors, instill fear of the risks of being unhealthy and motivate healthy weight behaviors in children. The findings suggest that, in order to assure that children can maximize the benefits of health interventions, it may be advantageous to direct intervention efforts at increasing self-efficacy *before* targeting other health variables.

WHAT DOES PHYSICAL LITERACY MEAN TO YOU? AN EXPLORATION OF PARENTS' UNDERSTANDING AND PERCEPTIONS OF PHYSICAL LITERACY

Kristen C. Reilly, B.HSc, MPH, Shauna M. Burke, Ph.D.

Faculty of Health Sciences, Western University, London, ON, Canada

Purpose: Physical literacy is defined as the knowledge, confidence, motivation, and physical competence to engage in physical activity for life (Whitehead, 2010). The purpose of this study is to explore parents' understanding and perceptions of physical literacy and its importance in their family.

Methods: Parents of children aged 16 years and younger, living in Ontario, Canada, were recruited to participate in an online questionnaire via social media (i.e., Facebook and Twitter) and word-of-mouth. Questionnaires contained a combination of Likert-scale and open-ended questions to examine parents': (1) understanding of physical literacy (e.g., "What does physical literacy mean to you?"), and (2) perceived importance of physical literacy in their family (e.g., "How much do you agree or disagree with this statement: physical literacy is important to me for my family?"). Quantitative data were analyzed with descriptive statistics and qualitative data underwent thematic analysis assisted by QSR NVivo 10.

Results: Participants (n = 81, M_{Age}= 39.2 years) were predominantly female (93.8%) and married (79.0%). More than half of respondents (62.5%) were familiar with the term "physical literacy". Participants provided a wide variety of meanings and definitions for physical literacy including knowledge of physical activity's impact on health, awareness of physical activity guidelines, and ability to perform fundamental physical movements. After reading a definition and several examples of physical literacy provided by the researchers, all participants (100.0%) agreed that it was important to them for their family. Overall, participants expressed that they valued physical literacy because it promotes health and wellbeing, strengthens family bonds through exercise, and enhances children's capacity to engage in physical activity for life. The majority of respondents (77.6%) believed that it could be improved by a moderate or great extent in their family.

Conclusions: Preliminary findings demonstrate the variability in parents' understandings of physical literacy. Though, generally speaking, parents perceived physical literacy to be important, they also believed that it could be improved within their families. Thus, researchers should be encouraged to explore and investigate the feasibility of home and community-based interventions and resources to enhance physical literacy in families.

BODY IMAGE DISSATISFACTION, DEPRESSION, AND DISORDERED EATING IN COLLEGE-AGED WOMEN SEEKING A YOGA INTERVENTION

Aviva H. Ariel-Donges, M.S., Eliza L. Gordon, M.S., Vivian Bauman, B.S., Masyn McMillin, N/A, Oshin Rai, N/A, Anaiz Rodriguez, N/A, Daniela Sanchez, N/A, Brittney Dixon, MPh, Abraham Eastman, B.S., Kathryn Ross, PhD, MPh, Michael Perri, PhD, ABPP

University of Florida, Gainesville, FL

Introduction: Previous studies have shown that 75% of college-aged women report body image dissatisfaction, and negative body image has been shown to be an independent predictor of disordered eating in young women. This study examined baseline characteristics and correlates of young women interested in a yoga intervention for body image dissatisfaction.

Methods: The preliminary study sample included 118 women (M ±SD; age = 21.0 ±2.7 years, White = 64.4%, Asian = 14.4%, Black = 13.6%, More than one race/Not reported = 7.6%, attending undergraduate/graduate school = 96.6%, BMI = 24.5 ±5.4 kg/m^2) screened for a yoga intervention for body image dissatisfaction. The relationships between baseline body image dissatisfaction (Multidimensional Body-Self Relations Questionnaire – Appearance Scales; MBSRQ-AS), depressive symptoms (Beck Depression Inventory – Second Edition; BDI-2), disordered eating symptoms (Eating Attitudes Test – 26), and demographic variables were assessed using Pearson correlations and independent samples t-tests. An MBSRQ-AS score $\leq$ 3.0 was utilized as the clinical cut-off for significant body image dissatisfaction, and a BDI-2 score $\geq$ 14 was utilized as the clinical cut-off for significant depressive symptoms.

Results: Clinically significant body image dissatisfaction was endorsed by 72% of participants. Although prior studies suggest a 10% prevalence rate of depression in college-aged women (e.g., Michael, 2006), 33.1% of women in this sample screened positive for clinically significant depressive symptoms. Moreover, while only 28.8% of the women had BMIs in the overweight/obese range, 55.1% reported trying to lose weight over the prior three months and 70.3% reported being $\geq$ 5 lbs. heavier than their ideal weight. More severe body image dissatisfaction was associated with greater depressive symptoms, $r = -.324$, $p < .001$, and greater disordered eating symptoms, $r = -.264$, $p = .004$. Moreover, those with negative body image reported significantly greater depressive symptoms, $t(97.8) = -3.63$, $p < .001$, and greater disordered eating symptoms, $t(116) = -2.15$, $p = .034$, than those with positive body image. Mean body image dissatisfaction was not significantly different across ethnicities or races (e.g., Caucasian vs. African American, $p = .115$).

Discussion: In this sample, clinically significant depressive symptoms were three times more prevalent than in the general population of college-aged women, and a substantial proportion of participants reported wanting to lose weight despite being at a healthy BMI. Notably, worse body image dissatisfaction was associated with greater depressive and disordered eating symptoms. These findings highlight the interrelation of mood, appearance evaluation, and health behaviors in young women interested in a yoga intervention for body image dissatisfaction.

A RANDOMIZED CONTROLLED TRIAL COMPARING TWO CONSENT INTERVENTIONS FOR ENROLLMENT INTO A SEQUENCING STUDY

Erin Turbitt, Ph.D.[1], Paola Chrysostomou, B.S. [2], Alexis Heidlebaugh, BS[1], Barbara B. Biesecker, PhD, MS[3]

[1]National Human Genome Research Institute, Bethesda, MD; [2]National Institutes of Health/ National Institute of Child Health and Human Development, Bethesda, MD; [3]National Human Genome Research institute, National Institutes of Health, Bethesda, MD

Despite the widespread use of genome sequencing in research, evidence-based procedures for obtaining participants’ consent to enter such studies are lacking. It is unknown how successfully participants make an informed choice (defined as having sufficient knowledge and attitudes consistent with one’s decision) to enroll in a sequencing study. Increasingly, such studies include return of secondary findings that should be made clear to participants. Secondary findings are results unrelated to the primary reason (such as the health condition under investigation) the sequencing was obtained.

This study compared an evidence-based “shorter” consent to a “standard” consent among women affected with primary ovarian insufficiency and eligible to participate in an NIH sequencing study. Participants were randomized to receive the shorter or the standard consent document. A mixed methods approach yielded data from surveys at baseline, immediate and six month follow up. Quantitative data were analyzed using descriptive statistics and bivariate analyses. Thematic content analysis was used to analyze qualitative data. Of the 387 women contacted, 212 were recruited and randomized (rr=55%), with complete data available from 188 participants. There were no differences between the two consent type groups in genome sequencing knowledge, perceived benefits or decisional conflict ($p>0.05$). Participants had high expectations to learn information of personal benefit, including secondary findings. Most (n=171) decided to participate in the sequencing study prior to the consent process. Intentions to receive secondary findings were high (mean, 10.9; SD, 1.6; maximum possible score 12) as were attitudes (mean, 6.5; SD, 0.9; maximum possible score 7). Based on the data from the knowledge, attitudes and intentions scores, 90 (47.9%) participants made an informed choice to receive secondary findings.

Participants have high expectations for receiving sequencing results of personal benefit. This study demonstrates a lack of differnce in outcomes between the longer, standard consent and the shorter consent suggesting that a more concise, evidence based consent is as effective at

consenting individuals to genome sequencing studies. However, it may be challenging to achieve informed choice, as defined by current measures, for receiving secondary variants. Future research should focus on the level of knowledge participants require to make an informed choice about entering a sequencing study.

A SYSTEMS-THINKING, PROBLEM-SOLVING APPROACH TO STUDY MIGRAINE SELF-MANAGEMENT AND EMPOWERMENT IN SOCIALLY VULNERABLE WOMEN

Deanna Befus, BSN, RN[1], Kristen Hassmiller Lich, PhD[2], Shawn Kneipp, PhD, RN, ANP-BC, APHN-BC, FAANP[3], Remy Coeytaux, MD, PhD[4]

[1]Duke University School of Nursing, Durham, NC; [2]University of North Carolina-Chapel Hill, Gillings School of Global Public Health, Chapel Hill, NC; [3]University of North carolina Chapel Hill School of Nursing, Chapel Hill, NC; [4]Community and Family Medicine, Duke University Health System, Durham, NC

Migraine affects over 20% of women and is the sixth most disabling condition worldwide. Both in incidence and severity, migraine disproportionately disables women with less education, living in poverty, un- or underemployed, and/or with high levels of chronic stress due to the unequal distribution of health-damaging experiences. Self-management is a crucial part of chronic illness management, with direct correlations to health outcomes. Yet, effectiveness of self-management behaviors is inextricably linked to social determinants of health. Socially vulnerable women are often ignored in highly medicalized migraine research, making their experiences and choices in managing migraine relatively unknown.

We developed a systems-thinking data collection approach that can feasibly be applied to study migraine self-management behaviors using a complexity/systems science framework with women in diverse social locations. We crafted a two-part activity for use in focus groups. First, using systems dynamics concept mapping, women tracked a migraine episode, from triggers through self-management strategies and desired and actual outcomes, including behavior needs, facilitators, and supports. Next was a causal loop diagramming activity to delve deeper into the relationships between triggers, self-management behaviors, and outcomes. Part two--while often enlightening for affluent participants—left more vulnerable women feeling overwhelmed and defeated, with a solution to one challenge becoming the cause of another. Through constant comparison analysis, we recalibrated the approach, using a combination of theory, clinical experience, and participant feedback to replace the causal-loop diagram with an individually-tailored, strengths-based problem-solving activity highlighting relationships and trade-offs in a more empowering, actionable way. Bringing a critical lens and strengths-based approaches for vulnerable populations can replace traditional deficit thinking in healthcare, developing options for leveraging resources and understanding complex health behaviors without losing sight of systemic, distributional justice issues. These tools can provide a way to extrapolate the complexities of actual self-

management behaviors and challenges faced by vulnerable women with migraine, versus what they may be instructed to do by a medical model that does not always account for the social determinants of health.

ASSESSING FIDELITY FOR A COMPUTER TAILORED INTERVENTION WITH TELEPHONIC COACHING FOR DECISION-MAKING IN KIDNEY TRANSPLANT

Zoe Mushkat, BS[1], Brian Tapscott, MA[2], Alexandra Murray, MA[2], Katherine Ashley, BS[3], Andrea Paiva, PhD[4], Crystal K. Amerson, MPH[5], Mark Robbins, PhD[4], Amy Waterman, PhD[5]

[1]University of Rhode Island, Narragansett, RI; [2]University of Rhode Island, Kingston, RI; [3]University of Rhode Island, Portsmouth, RI; [4]Cancer Prevention Research Center, University of Rhode Island, Kingston, RI; [5]David Geffen School of Medicine at UCLA, Department of Nephrology, Los Angeles, CA

Your Path to Transplant (YPT) is an ongoing longitudinal study that aims to enhance decision to pursue living donor kidney transplant (LDKT) in adults with end-stage renal disease utilizing a telephonic coaching intervention grounded in the Transtheoretical Model (TTM) of behavior change. This study aimed to evaluate reliability by assessing treatment fidelity to the intervention protocol. YPT coaches complete standardized surveys and deliver tailored feedback at three time-points over eight months, examining whether transplant education and individualized, computer tailored TTM feedback increases readiness, self-efficacy and decisional balance to pursue LDKT compared to usual care transplant education.

Five raters evaluated a random sample of audio recorded coaching sessions. Rater pairs assessed at least 10% of sessions at each study time-point. Coaching fidelity was assessed using a standardized rubric that assigns a scale value (1-3) to the coach's standardized interviewing capacity, quality of TTM feedback, and relevant clinical skills (e.g. reflective listening). Mean scores of all rubric items served as fidelity adherence scores for the coach's survey. Rater agreement was evaluated using the two-way random effects Intraclass Correlation Coefficient (ICC (2, *k*)) for each rater pair.

All surveys (n=777) were recorded for fidelity review, with 13% (101) of all intervention condition surveys rated by 2+ raters; scores ranged from 1.40 to 3 (*M*=2.58, *SD*=0.27). ICC revealed that rater agreement ranged from 0.76 to 0.92 where sample size was sufficient (n≥10 ratings between rater pairs), (M=0.83, SD=0.07). Raters demonstrated good (ICC=0.75–0.90) to excellent (ICC>0.90) reliability.

Significant ICC results indicate that fidelity raters are evaluating TTM telephonic feedback similarly and consistently. Monitoring intervention fidelity supports treatment efficacy and provides coaches with consistent evaluation and feedback for telephonic expert-system delivery. Future research will aim to evaluate whether rater agreement, which supports reliability, is also providing effective feedback for telephone coaches that supports patient decision-making for kidney transplant.

DEVELOPING AN INTERNATIONAL MEASURE OF BELIEFS ABOUT CAUSES OF MENTAL ILLNESS: THE MENTAL ILLNESS ATTRIBUTION QUESTIONNAIRE

Brandon A. Knettel, Ph.D.

Duke Global Health Institute, Raleigh, NC

The study of mental illness attributions, or beliefs about the causes of mental illness, is well-documented and ongoing in the academic literature. Attributions have traditionally been dichotomized along four dimensions based on their locus, controllability, specificity, and stability and have been associated with a wide variety of thoughts, emotions, beliefs, and actions related to the stigma of mental illness. However, more recent studies have introduced a new cross-cultural model incorporating lay beliefs about the specific biological, emotional, social, and spiritual causes of mental health problems. The present research outlines the design and initial validation of a comprehensive, international measure of causal beliefs using this new cross-cultural model, the Mental Illness Attribution Questionnaire (MIAQ). The research project included item formulation, piloting, qualitative rating, and preliminary validation with a sample of 680 international students representing 94 nations. Factors captured causes related to supernatural forces, social/stress, lifestyle, physical health, substance use, heredity/biology, and personal weakness. This structure was tested for model fit using confirmatory factor analysis across three vignette conditions – one each describing a man with schizophrenia, depression, or alcoholism – with further examination yielding strong test-retest reliability and promising convergent, discriminant, and cultural validity data. Taken together, the results support the MIAQ as a valid and reliable measure of mental illness attribution with strong potential for use in future studies, particularly those examining barriers to help-seeking and stigmatizing behavior across cultures.

DOES COGNITIVE STATUS MODIFY THE RELATIONSHIP BETWEEN SELF-RATED HEALTH AND MORTALITY?

M. Scott DeBerard, Ph.D.[1], Gail Rattinger, PharmD, PhD[2], Mindy Dokos, B.A.[1], Bryce Cooley, N/A[1], Chelsea Sanders, M.S.[1], Stephanie Behrens, N/A[3], Elizabeth K. Vernon, BA[4], JoAnn Tschanz, Ph.D.[1]

[1]Utah State University, Logan, UT; [2]Binghamton University, Binghamton, NY; [3]Utah State University, Lewiston, UT; [4]Utah State University, River Heights, UT

Self-rated health status (SRHS) predicts mortality in older hospitalized patients and community-dwelling persons, however its predictive validity in persons with dementia has not been established. We examined: 1) the correlation between SRHS and nurse ratings of health status (NRHS); 2) whether SRHS/NRHS predicted 12-year mortality; and 3) whether cognitive status modified the association between SRHS/NRHS and mortality in a population-based sample of older adults.

3340 participants [58% female; mean(SD) age = 77.3(6.47) years] had SRHS; a subset (686; 56% female) had both SRHS and NRHS. SRHS was assessed by asking how the participant felt over the past week (excellent, good, fair or poor), and NRHS was based on the General Medical Health Rating, which considers stable/unstable health conditions, frailty, and results of a physical exam. We used Spearman's rank correlation to examine the association between SRHS and NRHS and Cox proportional hazards regression models to examine time to mortality for each factor. Covariates tested included cognitive impairment [none, cognitive impairment-no dementia, dementia], age, sex, depression, and body mass index.

SRHS and NRHS were modestly correlated ($\rho = .31$), but not in persons with dementia. NRHS and SRHS predicted mortality: hazard ratio (95% CI) for NRHS "fair/poor" was 3.49 (2.59-4.70); SRHS "poor" was 2.65 (2.18-3.21), compared to those with "excellent" health. Cognitive status did not modify the associations between SRHS/NRHS and mortality. BMI and depression did not further predict mortality.

Self-rated health predicted mortality regardless of cognitive status. A simple self-rating may provide a quick and valid way to monitor health in older adults, even among persons with mild dementia.

EFFECT OF SERVICE QUALITY AND PERCEIVED RISK ON SERVICE VALUE, CONSUMER SATISFACTION AND CHURN INTENTION IN KOREAN NURSING HOMES

Jiyoung An, PhD, MPH, Claudio R. Nigg, PhD, FSBM

University of Hawaii, Honolulu, HI

Background: Korea has a rapidly increasing population of elders with 11.0% aged 65 and older in 2010, growing to 20.8% in 2026. Accordingly, service quality provided by long-term care (LTC) facilities and consumer retention (vs. new consumers) is paramount.

Purpose: Therefore, the effect of *service quality* (SQ) and *perceived risk* (PR) by consumers on *perceived service value* (PSV), *consumer satisfaction* (CS), and *churn intention/intention to leave* (CI) in LTC facilities was investigated.

Methods: Three dimensions of SQ are modelled(*technical quality* (TQ), *functional quality* (FQ), and *service environment* (SE)) and PR, assessing their effects on CS and PSV. A cross-sectional survey using convenience sampling of families or guardians of elders living in LTC facilities was utilized because these individuals are likely to make substantial elder-care decisions (n=235).

Results: The model fit statistics were χ^2 = 340.202 (d.f. = 152, p = 0.000), GFI = 0.862, AGFI = 0.810, NFI = 0.879, CFI = 0.928, RMR = 0.041, and RMSEA = 0.073, indicating acceptable fit. In the model, SQ consisting of TQ, FQ, and SE had a statistically significant impact on PSV. PR had a negative impact on PSV (β = -0.122, p = 0.004). Only TQ (β = 0.492, p = 0.016) and PSV (β = 0.397, p = 0.008) had statistically significant impacts on CS. Finally, CS (β = -0.327, p = 0.037) and PR (β = 0.510, p = 0.001) had statistically significant impacts on CI. For direct effects, CS was positively related to TQ (standardized coefficient = 0.474) and PSV (standardized coefficient = 0.328). CI was positively related to PR (standardized coefficient = 0.453).

Conclusion: PR related to nursing service had a direct impact on CI. Therefore, it is necessary to reduce uncertainty and risks related to the service. It also seems necessary to improve SQ perceived by consumers if the goal is to reduce CIof families or guardians.

ENHANCING PROCEDURES FOR INFORMED CONSENT (EPIC) STUDY

Jordan Skan, MS[1], Mariah Knox, BA[2]

[1]Alaska Native Tribal Health Consortium, Anchorage, AK; [2]Alaska Native Medical Hospital, Anchorage, AK

Informed consent is an important part of research with human participants. Historically, deception was common practice. Through extensive litigation, the rights of human participants in research have grown. This study is evaluating a technology-mediated method of informed consent. The project is part of the Healing and Empowering Alaskan Lives Towards Healthy-Hearts (HEALTHH) study; a video telemedicine intervention to improve heart health for Alaska Native (AN) People in rural Alaska. AN People have endured attempted cultural, physical, and social genocide. In addition, unethical research practices with AN People are well documented. Due to the problematic history of unethical research, historical trauma, and intrusion of a western worldview, it is a reasonable concern that AN People may be a vulnerable research population. This, coupled with additional concerns presented by telehealth delivery, highlights the need for researchers to ensure that truly informed consent is obtained from AN People. A multimedia enhanced form of the consent process may provide a better understanding of the elements of the study and allow participants to be more thoroughly informed when choosing if they wish to take part in studies. This project created a 9-minute animated video version of the consent form to enhance the informed consent process. The information presented as a hypothetical patient joining the study and going through study activities. Half of the participants were randomized to the standard paper-based consent while the other received the addition of the video. Immediately after, a brief survey and the MacArthur Competence Assessment Tool for Clinical Research (MacCAT-CR) were administered. The MacCAT-CR is an adaptable capacity assessment that measures understanding, appreciation, reasoning, and the ability to express a choice. It provides an overall score which can be used for comparisons. Preliminary data were gathered from 17 AN People (8 men, 9 women) with an age range of 32 to 64 (M=52 SD=10.5). The MacCAT-CR scores for the intervention group (M=27, SD=4) were significantly higher (better) than the control group (M=18, SD=9); t(15) = 2.66, p = 0.018, demonstrating better comprehension and ability to express a choice. Our video enhancement to the informed consent process is a useful prototype with large effects and applicability to a variety of health-related research projects.

HOW DO HEALTH EXPECTANCIES & VALUES COMBINE TO DETERMINE DIETARY INTENTIONS? APPLYING FUNCTIONAL MEASUREMENT TO FOOD INTAKE

Lauren A. Fowler, BS[1], Paige Clarke, MA[2], Steffi Renninger, MPhil[3], Zeljka Macura, B.S.[1], Philip Moore, PhD[4], Tonya Dodge, PhD[1]

[1]George Washington University, Washington, DC; [2]George Washington University, Bedford, NY; [3]The George Washington University, Germantown Rd, MD; [4]The George Washington University, Washington, DC

Background. The expectancy-value (EV) framework is one of the most prominent theoretical approaches to understanding and predicting health-related outcomes. By and large, EV models have predicted behavioral intentions (and, by extension, behaviors) by aggregating expectancies and values multiplicatively, positing that this is how these factors are cognitively integrated. However, this assumption has yet to be tested vis-à-vis other cognitive integration rules. This research used Information Integration Theory (IIT) to test empirically how health-related expectancies and values are cognitively integrated to determine dietary intentions.

Method. Ninety participants—with a mean age of 19.03 years (*SD*=0.92) and 73 females—were presented with a scenario depicting physical health consequences of junk food consumption (weight gain, disease risk), which varied in terms of objective probability (low, medium, high, and no probability information), and corresponding subjective participant expectancies. The values participants assigned to these consequences were trichotomized into low, medium, and high levels, and participants indicated their likelihood of consuming junk food for each of the probability conditions.

Results. Participants combined their health-related expectancies and values using an additive—rather than a multiplicative or averaging—cognitive integration rule to determine their intentions to consume junk food.

Conclusions. Dietary research and treatment—particularly for junk food consumption—may benefit by aggregating expectancies and values additively, and by addressing both in interventions designed to promote behavior change.

IMPACT OF SNAP ON HEALTH DISPARITIES AMONG ELDERLY PATIENTS WITH NUTRITIONAL DISEASE

Layla Booshehri, PhD, Jerome Dugan, PhD

Drexel University, Philadelphia, PA

This study investigates the impact of households altering their financial behavior to qualify for the nutritional safety net programs (i.e., Supplemental Nutritional Assistance Program, SNAP) on the incidence of nutritional diseases. Our study exploits the fact that individuals have the option to modify their financial behavior to deduct medical expenses at age 60 to qualify for SNAP (instead of being subject to a gross income test) and we use a difference-in-differences (DD) model to examine the impact of the SNAP eligibility on the morbidity of nutritionally sensitive diseases. Our primary study population consists of Medical Expenditure Panel Survey (MEPS) respondents aged 56 to 64. For the overall sample, the DD estimates show that SNAP has no impact on nutritional disease morbidity, with an exception for diabetes, where SNAP is associated with a statistically significant 10.4% ($P < 0.10$) decline in the incidence of diabetes. However, when narrower racial subgroups are considered, the results vary widely across race. Whites only report a 9.5% ($P < 0.05$) decline in the incidence of diabetes. On the other hand, blacks report that SNAP is associated with a 9.1% ($P < 0.10$) decline in the incidence of cancer, 29.8% ($P < 0.01$) decline in the incidence of hypertension, and 24.6% ($P < 0.05$) decline in diabetes. These results are significant, as they demonstrate that low-income households exploit changes in the SNAP eligibility rules by altering their financial decision-making (i.e., itemizing deductions on tax returns) to receive a direct cash-transfer from the government. Moreover, the results demonstrate that the altered financial decision-making leads to the adoption of health promoting behaviors that directly lead to a lower incidence of nutritional disease, and that minorities, blacks in particular, benefit the most from the program, which closes a significant baseline nutritional disease disparity across racial groups.

LIVING KIDNEY DONATION: ASSESSING POTENTIAL BARRIERS AND FACILITATORS THROUGH NOMINAL GROUP TECHNIQUE

Lindsey Dorflinger, PhD[1], Sanjay Kulkarni, MD[2], Carrie Thiessen, MD, PhD[2], Liana Fraenkel, M.D.C.M; MPH[2]

[1]Walter Reed National Military Medical Center, Bethesda, MD; [2]Yale School of Medicine, New Haven, CT

The number of individuals in need of donated kidneys far surpasses the number of donors, and, despite the literature showing improved outcomes for recipients of living compared to deceased kidney donation, the number of living donors has decreased over the past decade. The vast majority of individuals are aware of the need for donation, support the idea of living donation, and would consider donating to a known recipient, and many even report that they would consider donating to an unknown recipient. However, only a tiny proportion of these individuals ever go on to donate. This study utilized nominal group technique, a method designed to generate ideas around a specific topic and determine which ideas are most salient among group members, to determine what factors would make one more or less likely to serve as a living donor, as well as which factors are most important in the decision-making process. Thirty individuals, recruited from a large academic medical center, participated in four groups (two groups of seven women and two groups of eight men) in which they were asked to brainstorm factors that would impact willingness to be a living donor and vote on which factors they deemed most important. Responses were analyzed and categorized into themes. Participants identified and ranked the following factors (from most to least important): altruism, relationship to recipient, knowledge, personal risk/impact, convenience/access, cost, support, personal benefit, and religion. Ranking lists were similar for men and women, though women were more likely to report knowledge as a key factor in decision making, while men were more likely to identify altruism as a key factor. While much of the literature on living donation tends to debate the ethics of providing incentives for donation and eliminating disincentives, cost appears to play a smaller role in decision making compared to factors such as altruism and knowledge about the process and the personal impact that donation would have on the donor. Future studies should explore whether public campaigns that specifically address these factors might help to reduce the significant gap in supply and demand of kidneys.

LUNG CANCER SCREENING: A QUALITATIVE STUDY EXPLORING THE DECISION TO OPT OUT OF SCREENING

Lisa Carter-Harris, PhD, RN, ANP-C[1], Susan Brandzel, MPH[2], Karen J. Wiley. Wernli, PhD, RN, ANP-C[2], Joshua Roth, PhD, MHA[3], Diana S.M. Buist, PhD, MPH[2]

[1]Indiana University-Purdue University Indianapolis (IUPUI), Indianapolis, IN; [2]Group Health Research Institute, Seattle, WA; [3]Fred Hutchinson Cancer Research Center, Seattle, WA

Aims. Lung cancer screening with annual low-dose computed tomography is relatively new for long-term smokers in the U.S. supported by a US Preventive Services Task Force Grade B recommendation. As lung cancer screening programs are more widely implemented and providers engage patients about lung cancer screening, it is critical to understand what influences a patient's decision to screen, or not, for lung cancer. Understanding lung cancer screening behavior among high-risk smokers who opt out provides insight, from the patient perspective, about the shared decision-making process for lung cancer screening. The purpose was to explore screening-eligible patients' decision to opt out of lung cancer screening after receiving a provider recommendation. This knowledge will inform intervention development to enhance shared decision-making processes between long-term smokers and their providers and decrease decisional conflict about lung cancer screening.

Methods. Semi-structured qualitative telephone interviews were performed with 18 lung screening-eligible men and women who were members of an integrated, mixed model healthcare system in Seattle about their decision to opt out of lung cancer screening. Participants met lung cancer screening criteria for age, smoking and pack-year history. Audio-recorded interviews were transcribed verbatim. Two researchers with cancer screening and qualitative methodology expertise conducted data analysis using thematic content analytic procedures.

Results. Participant mean age was 66 years (SD 6.5). Majority were female (61%), Caucasian (83%), current smokers (61%). Five themes emerged: 1) Knowledge Avoidance; 2) Perceived Low Value; 3) False Positive Worry; 4) Practical Barriers; and 5) Patient Misunderstanding.

Conclusions. Many screening-eligible, smokers opt out of lung cancer screening. The participants in our study provided new insights into why some patients make this choice. While there are known drawbacks to lung cancer screening, and it is not necessarily the best option for everyone who is eligible, it is known to be effective in early lung cancer detection

among high-risk patients. Understanding why people decide not to screen will enhance future efforts to improve knowledge transfer from providers to patients about the risks and benefits of lung cancer screening and ultimately enhance shared decision-making about lung cancer screening.

PREDICTING COLLEGE STUDENTS' HUMAN PAPILLOMAVIRUS VACCINATION INTENTION

Apurva Barve, M.A.[1], Scott Roesch, Ph.D[2], Eric Walsh-Buhi, Ph.D., MPH[2], Kristen Wells, Ph.D., MPH[2]

[1]University of California, Los Angeles, Los Angeles, CA; [2]San Diego State University, San Diego, CA

A 'catch-up' Human papillomavirus (HPV) vaccine is recommended for 13 to 26 years-old females and 13 to 21 years-old males who have not been vaccinated previously. Most Americans reach adulthood without receiving the recommended HPV vaccine doses. HPV vaccine uptake is especially lower in key priority populations, indicating significant racial disparities and potential for enhancing preventive healthcare. Increasing the HPV vaccination series uptake requires theory-driven empirical research on factors influencing HPV-related decisions among young adults. Based on Social Cognitive Theory, this study assessed the interaction between personal and environmental determinants of vaccine uptake and its effect on behavioral intention to obtain the HPV vaccine. The lead author's Psychology Department participant pool was utilized to anonymously collect data from 209 participants, aged 18-26 years who had not yet obtained any dose of HPV vaccine. Data were analyzed using a series of eight Pearson or point biserial correlation analyses, one mediation analysis using PROCESS macro, and one path analysis. Findings demonstrated that: (1) social influence (i.e., parent and peer endorsement of HPV vaccine), HPV vaccine-related self-efficacy, attitudes and knowledge regarding the vaccine, and physician's recommendation to obtain the HPV vaccine were correlated with intentions to obtain the HPV vaccine (all *p*s < .05); (2) controlling for gender, self-efficacy mediated the relationship between social influence and intentions to obtain HPV vaccine, *p* were related to physician's recommendation, and this relationship, in turn, predicted intentions to obtain the HPV vaccine (both *p*s< .05). The present study offers an understanding of personal and environmental factors associated with HPV vaccine decisions among college students, and also highlights the need for studying these mechanisms longitudinally.

REDUCED ALTRUISM DURING DECISION MAKING IN VACCINE HESITANT INDIVIDUALS

Alex Francisco, M.A.[1], Jared Bruce, PhD[1], David Jarmolowicz, PhD[2], Seung-Lark Lim, PhD[1], Amanda S. Bruce, Ph.D.[3]

[1]University of Missouri - Kansas City, Kansas City, MO; [2]University of Kansas, Kansas City, MO; [3]University of Kansas Medical Center, Kansas City, KS

The United States has seen a recent resurgence of vaccine preventable diseases. Cases of measles have doubled in some instances when vaccine hesitant individuals intentionally withheld immunizations. Rates of personal beliefs exemptions for school vaccinations have increased as well. Under herd immunity, people who receive vaccinations provide a health benefit to people who are not vaccinated (Vietri et al., 2012). For instance, vulnerable populations who cannot safely be vaccinated receive protection from high levels of population vaccination uptake. This suggests that altruism may influence vaccine uptake. Our hypothesis was that individuals who are hesitant in the efficacy of vaccines would show lower altruism, thereby discounting the benefits to individuals outside their immediate social networks. mTurk was used to recruit vaccine confident (n = 50) and vaccine hesitant (n = 70) individuals for the present study. Participants completed a hypothetical treatment choice paradigm that presents a range of vaccine risks and benefits. This paradigm asks participants to consider benefits to socially distant individuals (using a scale from 1-100) as well as benefits to their children, and examines how their willingness to risk side effects changes as benefits to others are considered. Area under the curve (AUC) was used to assess altruistic motivation. Larger AUC indicates more willingness to risk side effects to prevent disease at each social distance. A 2x5 (hesitancy by social distance) repeated measure ANOVA assessed the main effects of hesitancy and social distance, as well as the interaction of vaccine hesitancy and social distance. Social distance proved a significant main effect ($f(4,472) = 3.05$, $p < .0001$) as did vaccine hesitancy ($f(1,118) = 10.57$, $p = .001$). Moreover, we uncovered a significant social distance by vaccine hesitancy interaction ($f(4,472) = 3.05$, $p = .04$). Results suggest that vaccine hesitant individuals are less altruistic when making their decisions and heavily discount vaccine benefits for their children as well as individuals outside their immediate family. Previous models have suggested that altruism may account for up to 25% of decisions to vaccinate (Shim et al., 2012), and this therefore could be used as a method to promote vaccine uptake and health outcomes. Our research quantifies the amount that vaccine hesitant individuals de-value potential benefits to their children and others during vaccine decisions. Future research may wish to examine means of providing psychoeducation to increase altruism among vaccine hesitant individuals.

ASSOCIATION BETWEEN PURPOSE IN LIFE AND GLUCOSE CONTROL AMONG MIDDLE-AGED AND OLDER ADULTS

Dina Griauzde, MD[1], Michele Heisler, MD, MPA[1], Hwajung Choi, PhD[1], Claire Ankuda, MD, MPH[1], Tyler Winkelman, MD[1], Jeffrey Kullgren, MD, MS, MPH[2]

[1]University of Michigan, Ann Arbor, MI; [2]University of Michgan, Ann Arbor, MI

Background: Greater purpose in life is associated with lower rates of certain chronic diseases. Whether purpose can protect against development of prediabetes or type 2 diabetes is unknown.

Purpose: To examine the association between purpose in life and change in blood glucose among 3,914 adults age ≥50 and without a history of type 2 diabetes or prediabetes in the Health and Retirement Study.

Methods: Baselinepurpose in life was measured using a 7-item, validated adaptation of Ryff and Keyes' Scales of Psychological Well-Being. Participants were then grouped into tertiles of purpose in life (high, medium, or low). We used multivariable linear regression to examine the association between change in HbA1c from baseline to 4-year follow-up and purpose in life. Multivariable logistic regression was used to examine the association between purpose in life and incident prediabetes or type 2 diabetes over the same time period.

Results: After adjusting for sociodemographic factors, body mass index, physical activity, and physical and mental health factors, change in HbA1c was 0.07 percentage points lower among participants with high purpose compared to participants with low purpose (95% CI, -0.12 to -0.02; p=0.011). Participants with high purpose had lower odds of developing prediabetes or type 2 diabetes compared to participants with low purpose (adjusted odds ratio 0.78 [95% CI, 0.62 to 0.98]; p=0.037).

Conclusions: Among older adults, greater levels of purpose in life are associated with a lower incidence of prediabetes or type 2 diabetes. Strategies to promote greater purpose in life should be tested as part of type 2 diabetes prevention efforts.

DEVELOPING A CULTURALLY TAILORED DIABETES SELF-MANAGEMENT PROGRAM FOR CHINESE AMERICANS WITH TYPE 2 DIABETES

Bin Xie, PhD[1], Yawen Li, PhD[2], Wei-Chin Hwang, PhD[3], Zhongzheng Niu, MS, MD[1], Xiaomeng Lei, BS[1], Ruizhi Yu, MD[1], Jamie Q. Felicitas-Perkins, MPH[1], Shabana Masood, MS[4], Kelsey Lawler, MPH[5], Diana Zhao, BS[6]

[1]Claremont Graduate University, Claremont, CA; [2]San Diego State University, San Diego, CA; [3]Claremont McKenna College, Claremont, CA; [4]Claremont Graduate University, Clarmeont, CA; [5]Scripps College, Claremont, CA; [6]Stanford University, Stanford, CA

Background/Aims: Despite having lower age- and sex-adjusted body mass index, Chinese Americans (CA) evidence higher risk for developing Type 2 diabetes than non-Hispanic Whites. Unfortunately, few attempts have been made to culturally adapt evidence-based diabetes interventions to this at risk group. The goal of this study is to develop a culturally adapt evidence-based intervention program for CA patients with Type 2 diabetes. A series of formative research under an integrative top-down and bottom-up community-participatory approach was conducted to identify areas for cultural adaptation.

Methods: A systematic review of diabetes self-management programs was conducted to evaluate strengths and weaknesses of extant evidence-based interventions. Five focus groups were conducted in the San Gabriel Valley region of Southern California with 23 CA participants (14 females and 9 males). Participants also completed a questionnaire regarding their diabetes self-management. On average, participants had a diabetes history of 18 years, and they were all first-generation of immigrants with 17 (73.9%) originally from mainland China and the rest from Taiwan, Hong Kong and Vietnam.

Results: Review of the literature indicated a number of areas where cultural adaptations can potentially take place such as communications with health professionals, medication adherence, family support and stress coping, dietary control and physical activity. Descriptive analyses with the questionnaire survey revealed that the average score was 9.96 out of 14 for diabetes knowledge, 2.93 out of 6 for distress, 2.61 out of 5 for diabetes quality of life, and 6.73 out of 10 for diabetes self-efficacy. Focus group results showed that most participants felt depressed when they were first diagnosed with Type 2 diabetes. Problems they encountered in their management of disease included lack of adequate communications with physicians or other health practitioners (e.g. clinical dieticians) on diabetes treatment and control, lack of culturally appropriate health education and materials, lack of access to training on how to optimize diabetes self-management. The biggest challenges they faced are dietary control and glucose monitoring.

Conclusion: Our formative research highlighted needs and directions for developing a culturally tailored diabetes self-management program for CAs.

DIABETES-RELATED DISTRESS AND INSUFFICIENT SLEEP FOR PERSONS WITH TYPE 2 DIABETES MELLITUS EXPERIENCING HEALTH DISPARITIES

Kerry Littlewood, Ph.D., MSW[1], Kerry Littlewood, Ph.D., MSW[1], Abhishek Pandey, MD[2]

[1]AAJ Research and Evaluation, Seminole, FL; [2]University of Arizona, Seminole, FL

Background: Diabetes-related distress, referring to “patient concerns about disease management, support, emotional burden, and access to care,” is substantively related to symptoms of depression, but a separate and distinct construct(Fisher, Skaff, Mullan, Arean, Mohr, Masharani, Glasgow, & Laurencin, 2007). Similar to depression, distress is significantly and positively associated with HbA1c(Fisher, Skaff, Mullan, Arean, Glasgow, & Masharani, 2008), and is highly responsive to intervention (Fisher, Hessler, Glasgow, Arean, Masharani, Naranjo, & Strycker, 2013). Fisher, Gonzalez, & Polonsky (2014) suggest studies clarify diabetes related distress so that appropriate and targeted patient-centered interventions can occur. Additionally, insufficient sleep has been associated emotional distress related to chronic diseases, such as T2DM (Liu, Croft, Wheaton, Perry, Chapman, Strine, McKnight-Eily, & Presley-Cantrell, 2013). Furthermore, few studies have examined insufficient sleep as it relates to disease-related distress (DD) in persons with T2DM.

Purpose: This study uses data from a Diabetes Self-Management Education Program to explore the relationship between insufficient sleep and DD. Descriptive, anovas and logistic regression are used to examine these relationships.

Results: Ninety-seven persons with T2DM (mean HbA1c = 8.79 ± 2.42) participating in a DSME Program at a southern urban community non profit hospital enrolled in this study. The majority of these patients were obese (mean BMI=38.56±8.20). Only 11% reported normal sleep, with 41% reporting short sleep (< 6 hours). 28% (n=22) reported distress meeting clinical thresholds. 73% (n=16) were also short sleepers [x^2(1, *N*=78)= 8.71, p=.003]. A logistic regression was performed to ascertain the effects of short sleep on the likelihood that participants would have clinical distress. The regression model was statistically significant, x2(1)=1.56, p < .05

Conclusions: We’ve found that people with T2DM who have insufficient sleep are five times more likely to experience clinical levels of distress. Interventions promoting healthy sleep may improve distress and ultimately improve disease management for those in need. Future research could more closely examine the relationship between sleep and distress.

DISORDERED EATING, NEGATIVE EMOTIONS, AND TYPE 1 DIABETES MANAGEMENT DURING LATE ADOLESCENCE

Ashley C. Baker, B.S.[1], Deborah Wiebe, MPH, PhD[2], Eunjin Lee, Ph.D.[3], Michelle Litchman, PhD, FNP-BC, FAANP[3], Cynthia A. Berg, Ph.D.[3]

[1]University of California Merced, Merced, CA; [2]University of California, Merced, Merced, CA; [3]University of Utah, Salt Lake City, UT

Late adolescence is a difficult time for those with type 1 diabetes (T1D), in part due to increased risk behaviors such as disordered eating (e.g. binge eating and insulin restriction). Disordered eating behaviors are more common among those who have high negative affect (i.e. depressive symptoms), which itself is associated with poorer glycemic control. These associations have generally been studied as a function of individual differences in negative affect and disordered eating rather than considering within-person daily processes. The present study examined whether negative affect was associated with individual differences and within-person day-to-day changes in disordered eating, and whether disordered eating was associated with glycemic control independent of negative affect. Adolescents recruited during their senior year in high school (N = 219; 59.6% female; 77% non-Latino Caucasian, 12% Latino, 5% African American) completed surveys evaluating their depression symptomology and insulin restriction with the intent to control weight; glycemic control was measured with HbA1c assay kits. Participants then completed a 2-week daily diary indicating daily binge-eating and daily blood glucose levels. At the individual difference (between-subjects) level, adolescents who restricted insulin to lose weight had higher depressive symptoms (*r*=.36), and poorer HbA1c (*r* = .15, *p*s < .05). Adolescents who restricted insulin also reported higher daily depressive symptoms (*r*=.23) and higher daily binge eating (*r*=.27) on average over the subsequent two weeks (*ps* < .05). Regression analyses revealed that associations of insulin restriction with HbA1c was marginally significant when depressive symptoms were covaried (β**=**.18, *p*=.07). At the daily (within-subjects) level, adolescents were more likely to report binge eating on days that they experienced heightened depressive symptoms, and this association occurred independent of a tendency to restrict insulin (coefficient (SE) = .30 (.15), p = .04). Finally, at the daily level, binge eating was associated with higher blood glucose levels independent of depressive symptoms that day, coefficient = 17.46 (SE = 6.98), p = .013. Findings demonstrate that risky disordered eating behaviors are more common in the context of negative affect, and that there are both individual and daily contextual factors that may be targeted to promote better diabetes management in this vulnerable population.

ECOLOGICAL MOMENTARY ASSESSMENT TO MEASURE MOTIVATORS AND BARRIERS TO BLOOD GLUCOSE MONITORING IN YOUTH WITH TYPE 1 DIABETES

Jennifer L. Warnick, BA, Sarah Westen, MS, David Janicke, PhD, ABPP

University of Florida, Gainesville, FL

Background: Type 1 diabetes (T1D) is the second most common pediatric chronic illness; adequate disease management requires daily monitoring of children's blood glucose (BG) levels. BG levels are often poorly controlled during adolescence, a time when youth are becoming more autonomous. Ecological momentary assessment (EMA) is the repeated sampling of behaviors and experiences in real time in the natural environment. The current study used EMA via text-message delivered surveys to evaluate the immediate motivators and barriers to BG monitoring in adolescents to better understand T1D treatment adherence in youth.

Methods: Adolescents between the ages of 11-21 with T1D were recruited during routine outpatient endocrinology appointments at the University of Florida Shands Hospital. Adolescents received 3 text messages per day for 10 consecutive days with a link to a brief survey which asked if the adolescent checked his/her BG the last time he/she ate, and why or why not. Descriptive and frequency analyses were conducted to assess the barriers and motivators to monitoring BG.

Results: 36 adolescents (mean age(SD)=16.6(2.7) years, 20 males, 78% Caucasian) with T1D answered a total of 592 surveys over a 10-day period (53.62% surveys answered). Of those who responded to the surveys, 71.5% indicated they had checked their blood glucose the last time they ate (10.3%=did not; 18.2%=hadn't eaten yet). The greatest motivator for checking BG was acknowledging it was important for health (97.1%), followed by being afraid of highs/lows (31.7%), and not wanting to upset doctors (26.9%) or parents (21.4%). Barriers to checking BG included forgetting (55%), ignoring (33.3%), not having a meter with them (30%), thinking it was not necessary (8.3%), and not wanting to check in front of others (6.7%).

Conclusion: This study provides preliminary evidence on the barriers and motivators of BG monitoring adherence. Given the greatest barrier to BG monitoring in this sample was forgetfulness, future research may examine the use of mobile health interventions to remind adolescents with T1D to monitor.

EVALUATION OF AN INTEGRATED RESEARCH PRACTICE PARTNERSHIP TO ADDRESS DIABETES DISPARITIES IN LATINO FAMILIES

Erica G. Soltero, PhD[1], Crystal Ramos, BA[1], Allison Williams, MSW[1], Yolanda Konopken, Registered Dietician[2], Elva Hooker, RD[2], Jennifer Mendez, Certified Group Fitness Instructor[3], Heidi Wildy, BA[3], Karen Davis, BA[3], Addey Rascon, RD[3], Matthew Sandoval, M.Ed.[3], Valentina Hernandez, BS[4], Scott Leischow, PhD[5], Omar Contreras, MPH[6], Gabriel Shaibi, PhD[7]

[1]Center for Health Promotion and Disease Prevention, Arizona State University, Phoenix, AZ; [2]St. Vincent de Paul Medical and Dental Clinic, Phoenix, AZ; [3]Valley of the Sun YMCA, Phoenix, AZ; [4]Mountain Park Health Center, Phoenix, AZ; [5]Mayo Clinic, Scottsdale, AZ; [6]Arizona Department of Health Services, Phoenix, AZ; [7]Arizona State University, Phoenix, AZ

Multi-sector, participatory approaches are needed to address the complex challenge of preventing type 2 diabetes and reducing health disparities in high-risk populations. Integrated research practice partnerships bring academic, community, and clinical partners together to develop and implement innovative strategies to accelerate the translation of research to practice and to improve the health of communities. This study aimed to evaluate the impact of one such partnership on building capacity for developing, implementing and assessing a community-based diabetes prevention program for Latino families.

The collaboration included a Federally Qualified Health Center, a family wellness program, a YMCA, and an academic research institution. The partnership was created to foster resource sharing, bidirectional exchanges of knowledge and skills, communication, and capacity building to deliver a diabetes prevention program to Latino families. Administrators and staff (*N*=12) from each institution completed the Community Impact of Research Oriented Partnerships tool, which uses a 7 point Likert scale (7=great impact-1=no impact) to assess perceptions of the personal and organizational impact of the partnership.

After the first year of planning and implementation, Partners reported that the partnership had a moderate to high impact on their personal knowledge development (*M*= 6.4±.2), personal research skill development (*M*=4.6±.5), organizational access to and use of information (*M*= 5.3±.2), and organizational development (*M*= 4.9±.4). Areas within the partnership that had the most impact included the collective ability to develop a shared mission, partner with a medical home, and improve capacity to engage in research. Areas of least impact included advocacy, securing additional funding, and engaging a broader range of collaborators.

These findings demonstrate that partnership activities are impacting personal and organizational capacity to engage in research. Capacity building has significant implications for the sustainability and expansion of the diabetes prevention program and will empower Partners to engage in future research opportunities. Similarly, improving personal and organizational knowledge through the use of health information can benefit the current program and improve other services within each institution. Evaluation of collaborative partnerships is essential to identify strengths within the partnership that can be leveraged and weaknesses that should be addressed.

EXPLORING TYPE II DIABETES AND HYPERTENSION: THE LIVED EXPERIENCE

Hollie Pellosmaa, PhD[1], Angela Liegey Dougall, PhD[2]

[1]The University of Texas at Arlington, Knoxville, TN; [2]The University of Texas at Arlington, Arlington, TX

BACKGROUND: Helping to reduce the occurrence, and improve the management, of Type II diabetes and hypertension is a major goal for primary care providers. To achieve these goals, it is important to elucidate how patients understand multiple factors of their conditions; such as what caused the condition, its associated symptoms, complications, and treatments. The overall aim of the current study was to elicit qualitative responses about these factors, in order to understand illness beliefs among diabetic and hypertensive patients. METHODS: Older diabetic (*N* = 27, mean age = 63 years) and hypertensive (*N* = 50, mean age = 72 years) adults recruited from the community took part in a 60-minute semi-structured interview, which covered the entire course of their disease. Four themes associated with each condition were analyzed using NVivo: (1) causes, (2) complications, (3) symptoms, and (4) treatments. RESULTS: Participants spent most of the interviews discussing their medical treatments; diabetics mentioned treatments 277 times, and hypertensive patients 580 times. Subjects focused on their prescribed medications as well as their diet and exercise regimes (or lack thereof), and to a lesser extent complementary and alternative medications. Diabetic participants were more likely to discuss the difficulty of adhering to diet/exercise plans, and they were less specific than hypertensives in acknowledging types of foods/exercises which were healthy. Interviews also focused on the complications (diabetic = 97, hypertensive = 269) and symptoms (diabetic = 115, hypertensive = 195) that the participants experienced or had heard about. Diabetic participants were more likely to discuss extreme complications and symptoms which they had experienced firsthand, whereas hypertensive participants often stated that they were asymptomatic but explained symptoms and complications which they had heard about from friends and family. A small portion of the interviews focused on the causes of the conditions (diabetics = 53, hypertensives = 145). CONCLUSIONS: These results highlight the lived experience of the participants, and reveal that there are differences in the participants' beliefs depending on which condition they had. Overall, participants focused on their daily actions and consequences of having a chronic illness. This research may lead to advances in the ways medical care is presented to specific elderly populations, thereby enhancing the lives of individuals.

GOAL-SETTING FOR TYPE 1 DIABETES MANAGEMENT

Tammy Stump, PhD[1], Deborah Wiebe, MPH, PhD[2], Cynthia A. Berg, Ph.D.[3], Michelle Litchman, PhD, FNP-BC, FAANP[3]

[1]Feinberg School of Medicine, Northwestern University, Chicago, IL; [2]University of California, Merced, Merced, CA; [3]University of Utah, Salt Lake City, UT

Diabetes management is a complex self-regulatory task, which requires consistent monitoring and adjustments. Such tasks may be aided by setting domain-relevant goals. However, not all types of goals may be equally beneficial. According to current research on goal-setting, the more specific a goal is, the better it will serve as a guide to behavior. For instance, whereas higher-level goals (e.g., ”get sugars down”) only specify a general target and not the means to achieve that target, a low-level goal (e.g., “test blood sugar before every meal”) specifies the precise behavior to perform, potentially making it more automatic to perform that behavior. Thus, diabetes-related goals that deal with low-level behaviors, such as performing blood glucose checks, may be more effective than higher-level goals, such as improving blood glucose or HbA1c levels.

In the present study, we examined predictors of the domains of goals as well as how these goals were related to diabetes-related management over the next two weeks among young adults with type 1 diabetes (*N*=239). At baseline, participants were asked to set a diabetes-related goal that they intended to work on over the next two weeks. Two coders categorized goals as belonging to one of six domains (Blood glucose checks, diet, insulin, blood glucose levels, HbA1c, Other). A subset of 20% of the goals were double-coded; agreement was 92%.

Baseline predictors of goal content were analyzed in a series of logistic regression models in which predictors (IQ, HbA1c, self-reported adherence, gender, and time since diagnosis) were entered simultaneously. Participants exhibited responsiveness to their current weaknesses; those with lower reported adherence were more likely to set a goal related to blood glucose testing, and those with higher HbA1c were more likely to set a goal related to their HbA1c level.

Next, in a series of multilevel models, goal domain was used to predict diabetes-related management reported in daily diaries (mean blood glucose, self-reported adherence) over the next two weeks. Overall, compared to the other domains, setting a goal related to blood glucose testing predicted worse management. However, during the two-week diary period, a significant decrease in mean daily blood glucose over time was observed only among those

who set a goal related to blood glucose testing, suggesting that this type of goal, which contains the specific behavior to be performed, assisted young adults to begin to change their behavior. Young adults with type 1 diabetes are more likely to benefit from setting realistic, short-term goals targeting specific behaviors.

INFLUENCE OF NEIGHBORHOOD DISORDER AND LEVEL OF EDUCATION ON DIABETES DISTRESS AND SELF-CARE

Naomi Kane, M.A.[1], Elizabeth A. Walker, PhD, RN[2], Clyde Schechter, M.A., M.D.[3], Elizabeth Seng, Ph.D.[4], Jeffrey Gonzalez, Ph.D.[4]

[1]Yeshiva University, New York, NY; [2]Albert Einstein College of Medicine, lrchmont, NY; [3]Albert Einstein College of Medicine, Cypress, CA; [4]Yeshiva University, Bronx, NY

Type 2 diabetes (T2DM) affects a greater proportion of socially and economically disadvantaged individuals. The conditions in which individuals live may have important consequences for diabetes self-care. This study examined the relationships between indicators of socioeconomic status, neighborhood disorder, and diabetes distress alongside diabetes self-care behaviors.

N= 941 adults with T2DM in suboptimal glycemic control were recruited for a larger telephonic intervention study in the South Bronx. *N*= 480 completed self-report measures assessing neighborhood disorder, diabetes distress, and diabetes self-care behavior. Regression examined main effects of individual and neighborhood socioeconomic factors on health behaviors; and moderation effects of individual and neighborhood level disadvantage on the association between diabetes distress and health behaviors.

Participants (*N*= 480) were predominately middle-aged adults (mean[SD]=56.4[11.7] years old), female (67%), Latino (68%), Black (28%), had incomes below $20,000 (77%), and completed the 11th grade or less (50%). Diabetes distress demonstrated stronger and more consistent relationships with self-care behaviors (R^2= .11, *p*< .001 for diet, R^2= .08, *p*< .001 for medication) than neighborhood disorder (R^2= .02, *p*= .131 for diet, R^2= .02, *p*= .021 for medication). Neighborhood disorder was independently associated with diabetes distress (*B*= .04*,* *p*< .001). The relationship between diabetes distress and both diet and exercise was significantly stronger among individuals with higher educational attainment (*ps*< .001*).* On the other hand, the relationship between diabetes distress and exercise was significantly stronger at lower levels of neighborhood disorder (*p*< .001).

Diabetes distress, unlike neighborhood disorder, was consistently associated with health

behaviors. Moderation results suggest the strength of the relationship between distress and self-care behavior is influenced by level of education and perceptions of neighborhood disorder. At lower levels of education and higher levels of neighborhood disorder, other factors besides diabetes distress may play a greater role in influencing diabetes self-care. It may be important for health professionals to factor in the neighborhood context when evaluating and addressing diabetes-specific distress.

INFORMATION, MOTIVATION, & BEHAVIORAL SKILLS BARRIERS TO ADHERENCE AMONG ADULTS WITH DIABETES IN SAFETY-NET CLINICS

Lindsay S. Mayberry, MS, PhD[1], Lyndsay A. Nelson, PhD[1], Chandra Osborn, PhD, MPH[2]

[1]Vanderbilt University Medical Center, Nashville, TN; [2]One Drop, Nashville, TN

Nonadherence to diabetes medication is common and associated with suboptimal glycemic control and a cascade of health problems. According to the Information-Motivation-Behavioral Skills (IMB) model of diabetes medication adherence, adherence to diabetes medications is determined by adherence-related information, personal and social motivation, and behavioral skills. This model has explained over 40% of adherence behavior among adults with type 2 diabetes (T2D) and low socioeconomic status using validated measures of the IMB constructs. However, *barriers* to diabetes medication adherence have not been identified using the IMB model as a guiding framework.

We conducted a thorough review of published studies reporting medication adherence barriers among adults with T2D and identified 36 unique barriers (31 general and 5 insulin-specific). We mapped each barrier onto Information (IN), Personal Motivation (PM), Social Motivation (SM), or Behavioral Skills (BS). Adults with T2D (N=102) receiving care at Federally Qualified Health Centers in Nashville, TN rated how much each barrier got in the way of taking their diabetes medicine(s) (1=not at all to 10=a lot). For each IMB model construct, we identified the most frequently endorsed (scored>1) barriers and averaged scores to examine bivariate relationships with participant characteristics (i.e., age, gender, race/ethnicity, education, income, health literacy [Brief Health Literacy Screen, BHLS], diabetes duration, insulin status, number of diabetes medications), medication adherence (Adherence to Refills and Medications Scale for Diabetes), and glycemic control (A1c) using nonparametric tests (Spearman's ρ/Mann-Whitney U).

Participants endorsed BS and PM barriers most frequently and ranked IN and PM as creating the largest (highest scored) barriers. Younger participants reported more IN (ρ=-.21), PM (ρ=-.25) and SM (ρ=-.21) barriers (all *p*ppppp

Identification of specific IMB barriers can improve patient education and by informing intervention content and priorities. Among adults with T2D and low socioeconomic status, adults' IMB barriers were associated with younger age, limited health literacy, and worse medication adherence and A1c. These findings, combined with prior validation of the IMB model of diabetes medication adherence, suggest targeting these barriers will improve adherence and, in turn, glycemic control.

MOTIVATING DIABETES SELF-CARE: PATIENTS’ PERSPECTIVES ON SOCIAL AND GOAL-BASED COMPARISONS OF DIABETES HEALTH STATUS

William Martinez, MD, MS[1], Kenneth A. Wallston, PhD[2], Gerald Hickson, MD[1]

[1]Vanderbilt University Medical Center, Nashville, TN; [2]Vanderbilt University, Pisgah Forest, NC

Background

Social comparisons, self-evaluation in comparison to others, can influence motivation and behavior. However, little is known about patients’ perspectives toward social comparison information regarding their diabetes health status. This study aims to understand patients’ perspectives on social-comparison information regarding their diabetes health status and how receiving such information might compare to goal-based comparisons (i.e., self-evaluation in comparison to a set standard such as hemoglobin A1C < 7).

Methods

We conducted semi-structured interviews with 25 patients with type 2 diabetes regarding social comparisons involving their diabetes health status (e.g., self-evaluation of their own A1C in comparison to others’ A1Cs). Using thematic content analysis, 2 independent researchers coded interview transcripts, reached consensus, and identified themes.

Results

Participants were 48% female, 68% white, 52% college graduates, mean age was 65 years (range: 45 – 81), mean A1C was 7.5% (range: 5.6 - 12.6%). Participants reported comparing their diabetes health status to others they knew with diabetes to varying degrees. Participants who compared themselves to others commonly reported comparing to others who were socio-demographically similar (e.g., same race/ethnicity, age, gender, neighborhood), and that these similarities made the comparisons more relevant to their self-evaluation. Themes included desire for information about one’s diabetes health status compared to similar others, belief that this information would be motivating either to improve (if doing worse than most others) or maintain their self-care behaviors (if doing better than most others), and that this information was more “personalized” and motivating than comparisons to a standard goal (e.g., A1C < 7). If faced with social comparison information that indicated that their diabetes health status was worse than the majority of similar others, eleven participants described a desire for information about what the others were doing differently (e.g., taking a different medication, eating differently), and said they would use this information to improve their own diabetes health status.

Conclusions

Providing patients with social comparison information about their diabetes health status may increase motivation for self-care and promote information seeking among some patients.

Program ACTIVE II: Treating Major Depression in T2DM

Objective: Program ACTIVE II (R18DK092765) is a multi-state comparative effectiveness study of cognitive behavioral therapy (CBT) and community-based exercise on depression and glycemic outcomes in adults with major depressive disorder (MDD) and type 2 diabetes (T2DM).

Research Design and Methods: The study utilized a 2X2 factorial repeated measures RCT design in which participants were randomized to: CBT (10 individual sessions), EXER (12 weeks of community-based exercise), CBT+EXER (10 individual CBT sessions and 12 weeks of concurrent exercise) or usual care (UC). Participants were assessed at baseline and post-intervention (POST). Participants were recruited from Indiana, Ohio, and West Virginia using a community-engaged research (CEnR) approach. Community partners in mental health and exercise provided interventions to participants.

Results: The sample (N=140) was mean age 56 years (SD=10.7), 77% female, 71% White, 52% married and 34% completed high school or trade school. At POST, participants assigned to CBT, EXER, or CBT+EXER reported fewer depressive symptoms ($p < .01$), improved automatic thoughts ($p < .04$), improved physical quality of life (QOL; $p=.01$), and improved diabetes distress ($p < .01$). Participants in EXER and CBT+EXER reported improved diabetes-specific QOL ($p < .01$) compared to UC. Pairwise comparisons showed the odds of achieving at least partial remission from MDD for CBT and EXER groups were 12.6 and 5.6 times the odds for UC, respectively ($p < .03$). Odds of full remission for CBT, EXER, and CBT+EXER were 5.3 to 6.5 times the odds for the UC group ($p < .01$) as assessed by psychiatric interview. For participants with a baseline HbA1c≥7.0, EXER resulted in a clinically meaningful 0.7% improvement in HbA1c ($p < .03$).

Conclusions: Program ACTIVE is a set of manualized interventions that has demonstrated clinically meaningful improvements in depression and glycemic outcomes in adults with

T2DM. These interventions are beneficial to behavioral health and exercise professionals to increase access to depression treatment for patients with T2DM.

PSYCHOLOGICAL STRESS, SOCIAL SUPPORT, AND GLUCOSE REGULATION IN A LOW-INCOME MIGRANT COMMUNITY ON THE U.S.-MEXICO BORDER

Daniela G. Vital, B.S.[1], Selena Lopez[2], Jessica McCurley, M.S.[3], Linda C. Gallo, PhD[4]

[1]University of California, San Diego, San Diego, CA; [2]UC San Diego, San Diego, CA; [3]SDSU/UC San Diego, San Diego, CA; [4]San Diego State University, Chula Vista, CA

The global increase in type 2 diabetes (T2DM) prevalence has become an urgent public health concern. Migrants and other low-income individuals living near the U.S-Mexico border are at elevated risk for T2DM due to poor access to medical care, disrupted employment, psychological stress, and lack of social support. Prior research has shown a relationship between psychological stress and the development of glucose dysregulation and T2DM. Social support is associated with better health and may influence the relationship between stress and glucose regulation. This cross-sectional study explored the association of self-reported psychological stress with clinically measured glucose regulation in a convenience sample of individuals seeking free medical care in Tijuana, Mexico in 2016, and explored whether social support moderated this relationship. Participants were 165 Hispanic/Latino adults $\geq$18 years old who spoke Spanish or English. Stress was measured using the 4-item Perceived Stress Scale (PSS); social support was assessed via the 12-item Interpersonal Support Evaluation List (ISEL). Glucose regulation was determined by point-of-care hemoglobin A1c (HbA1c) percentage. Participant mean age was 46.9 years (SD = 11.7) and 76.4% were male. The majority (74.5%) reported history of migration to the U.S., 78.9% reported at least one experience of deportation out of the U.S., and 35.8% reported intent to migrate to the U.S. in the next year. Mean HbA1c percentage was 6.1% (SD = 1.8), which falls in the range of prediabetes. Mean PSS score was 7.1 (SD = 3.0, range = 0-16); mean ISEL-12 score was 19.5 (SD = 6.8, range = 0-36). Stress was significantly associated with glucose regulation ($r = .24$, $p < 0.01$). Adjusting for age, sex, and education, individuals who reported higher stress had significantly higher (poorer) HbA1c values ($\beta = 0.14$, $p < .01$). This relationship remained significant after controlling for previous diabetes diagnosis. Social support was negatively associated with stress ($r = -.42$, $p < .01$), but not associated with glucose regulation, and did not moderate the relationship between stress and glucose regulation. Psychological stress is a prevalent and potentially modifiable determinant of cardiometabolic risk in low-income individuals and migrants living along the U.S.-Mexico border. Interventions for stress reduction and management may reduce risk for diabetes and decrease individual and public heath costs in both the U.S. and Mexico.

RACIAL DIFFERENCES IN PREVALENCE OF DIABETES AND DIABETES SELF-MANAGEMENT USING CALIFORNIA HEALTH INTERVIEW SURVEY (CHIS)

Tashi Lhamo, NA, Hee-Soon Juon, PhD

Thomas Jefferson University, Philadelphia, PA

Background: Diabetes affected 9.3% of the U.S population in 2012 and the prevalence continues to rise rapidly. Minority groups are affected by diabetes significantly at a greater rate compared to White Americans. Despite having lower BMI, Asian Americans are more likely to have diabetes compared to White. Among Asians, Asian Indians and Filipinos are found to have the highest prevalence of diabetes. Scholars have stated that 95% of the diabetes care is self-care. Therefore, the integral part of effectively managing diabetes is to practice good diet, physical activity, blood sugar monitoring, medication adherence and self-efficacy. Although diabetes management practices among different ethnic groups have been studied, little is known about diabetes management among Asian.

Methods: We used data from 2009 CHIS to study racial differences in the prevalence of diabetes and diabetes self-management. We performed a univariate analysis to describe the prevalence of diabetes among racial and ethnic groups. A multivariate logistic regression model (including age, gender, level of education, insurance, BMI, poverty level and regularity of exercise) was conducted with weighted analyses using svy from STATA version 13.

Results: Among 47,614 California adults, the prevalence of diabetes was 8.46% (95% CI 0.08-0.10). American Indians/Alaska Natives (26%, 95% CI 0.16-0.40) had the highest prevalence of diabetes among all race groups. White Americans had the lowest (6.3%, 95% CI 0.06-0.07) prevalence of diabetes followed by Asian Americans (7.75%, 95% CI 0.06-0.10). However, the disaggregation of Asian data indicates that Filipinos (12.4%, 95% CI 1.23-3.57) are significantly more likely to have diabetes compared to White. In multivariate analysis, being a male, older, having lower education, health insurance, low poverty level, being obese, and not exercising were associated with having diabetes. Among ethnic groups, Koreans are worst at self-managing diabetes.

Conclusion: Finding indicates that diabetes prevalence is increasing rapidly in Asians compared to Whites. It also highlights the importance of disaggregating data to understand diabetes prevalence among racial and ethnic groups. The difference in diabetes management demonstrates the importance of culturally integrated interventions to target these populations.

REPRODUCTIVE HEALTH AWARENESS AND COMMUNICATION IN DIABETIC ADOLESCENT LATINAS AND THEIR MOTHERS

Frances Peterson-Burch, RN BSN BA[1], Denise Charron-Prochownik, PHD, RN, CPNP, FAAN[1], Keirsten Montgomery, FNP-C[2], Dara H. Sorkin, PhD[3], Hiba Abujaradeh, MSN, RN[1], Patricia Schmitt, MPM[1], Ellen Olshansky, PhD, RN, WHNP-BC, FAAN[4]

[1]University of Pittsburgh, Pittsburgh, PA; [2]CHOC Children's, Orange, CA; [3]University of California Irvine, Irvine, CA; [4]University of Southern California, Los Angeles, CA

Funding: Eli Lilly USA H60-US-X002

Introduction: Diabetic adolescent Latinas are at increased risk for reproductive health (RH) complications, including poor maternal/child outcomes. Current recommendations require that preconception counseling (PC) start at puberty.

Purpose: To describe understanding of diabetes, sex, family planning, pregnancy, and PC among diabetic young Latinas (13-21 yrs.) and their mothers and to explore cultural modifications of a validated PC program for diabetic teens (READY-Girls).

Methods: Qualitative, descriptive study; used open-ended questions and markups of the READY-Girls book. Latina mothers and daughters reviewed pages from the book and wrote comments on pages. Analysis was guided by qualitative descriptive methods. Responses to questions and markups were transcribed for theme analysis. Three members of the research team discussed themes and consensus was reached.

Sample: 19 daughters and 13 mothers were recruited from a children's hospital. Most daughters (n=11) were 16-18 yrs.; 11 had type 2 diabetes (T2D) and 8 T1D.

Results: Major themes: 1) Lack of Latina mother-daughter (M-D) communication about sex and pregnancy (e.g., most M-Ds had not talked about sexuality or pregnancy; mothers want daughters to initiate conversations but daughters may be uncomfortable), 2) importance of diabetes management (most M-Ds reported healthcare providers (HCPs) discussed diabetes but did not provide PC or RH information), 3) diabetes complications on pregnancy (e.g., infant mortality, maternal death, infertility), 4) importance of safe sex, while difficult to discuss (e.g., both M-Ds expressed that talking about RH was important but "awkward", “embarrassing”; mothers were concerned about teen pregnancy; daughters stated that teen sex/pregnancy is seen as disappointing; most M-Ds stated their culture encourages delay of sex/pregnancy until marriage), and 5) lack of communication between girls HCPs about RH (e.g. only 5 daughters and 1 mother reported having heard of PC).

Conclusions: While diabetes information was provided by HCPs, deficits were reported in RH. Many M-Ds do not appear to be discussing RH amongst themselves. These data can help to modify a culturally-relevant PC program for young Latinas and support further research.

SELF- AND SOCIAL REGULATION IN EMERGING ADULTS WITH TYPE 1 DIABETES

Ascher Munion, BS in Psychology[1], Jonathan Butner, Ph.D.[2], Deborah Wiebe, MPH, PhD[3], Caitlin Kelly, M.A.[1], Sara L. Turner, M.S.[1], Cynthia Munion, PhD[1]

[1]University of Utah, Salt Lake City, UT; [2]University of UTah, Salt Lake City, UT; [3]University of California, Merced, Merced, CA

Self-management of type 1 diabetes (T1D) poses significant regulatory challenges where patients must simultaneously engage in self-regulation (regulating their thoughts, behaviors, and emotions) together with regulating their social context to facilitate optimal diabetes management and outcomes. Previous dynamic systems modeling with this sample during late adolescence revealed multiple facets of self-regulation were coordinated together and that facets of social regulation (disclosing to parents so that parents are knowledgeable and can help) were coordinated separately for mothers and fathers. Further, mothers' helpfulness specifically served to support adolescents' self-regulatory efforts. Due to normative developmental changes in relationships during late adolescence, with parents potentially becoming less involved, it is important to examine how self- and social regulation function in diabetes management in the face of these changes. The goal of the study was to investigate whether this same self- and social-regulatory structure characterized the self- and social regulation of these individuals one year later as these emerging adults managed their diabetes in the context of friend relationships. Emerging adults with T1D (N=203, M_{age} = 18.7) reported – for both mothers and fathers - how much their parents knew about their diabetes management, whether they disclosed to their parents, how helpful their parents and friends were for their diabetes management, as well as multiple facets of their own self-regulation surrounding diabetes care (negative affect, self-regulatory failures, and adherence behaviors) for 14 days in an online diary. Using a dynamical systems approach, a multi-level latent coordination model was used to first evaluate the coordinative structure of self- and social regulation and then identify which of the variables drove the changes in other variables in the diabetes management system. Consistent with patterns observed in late adolescents, the best-fitting model included separate factors for social regulation involving mother and father and for self-regulation. However, a shift emerged in the relations between these coordinated structures from the previous time point. Mothers no longer drove day-to-day changes in regulation, and fathers were much more distally connected. Neither mothers nor fathers significantly influenced changes in daily self-regulation surrounding diabetes. The results suggest greater independence between self and social regulation in the diabetes

management system during emerging adulthood than during adolescence, which is consistent with broader normative changes in the emerging adults' relationships with their parents.

SELF-CONTROL IS ASSOCIATED WITH ADHERENCE TO CERTAIN SELF-CARE BEHAVIORS AMONG ADULTS WITH TYPE 2 DIABETES

Lyndsay A. Nelson, PhD[1], Kenneth A. Wallston, PhD[2], Chandra Y. Osborn, PhD, MPH[3], Lindsay S. Mayberry, MS, PhD[1]

[1]Vanderbilt University Medical Center, Nashville, TN; [2]Vanderbilt University, Pisgah Forest, NC; [3]Informed Data Systems Inc., Nashville, TN

The initiation and maintenance of diabetes self-care behaviors (i.e., taking medications, eating healthily, exercising, and self-monitoring blood glucose) are critical for achieving optimal glycemic control and preventing diabetes complications. However, rates of self-care adherence remain low among adults with type 2 diabetes (T2D). Self-control is the ability to alter one’s emotions, desires, and behaviors to meet long-term goals, and may be a determinant of self-care initiation and maintenance. Associations between self-control and healthier eating and more exercise have been reported among people without diabetes and people with type 1 diabetes, but evidence of these relationships among people with T2D is limited. Therefore, we examined cross-sectional associations between self-control and adherence to diabetes self-care behaviors using baseline data from a diabetes self-care promotion intervention.

Adults with T2D who were receiving care at Federally Qualified Health Centers in Nashville, TN consented, provided patient characteristics (i.e., age, gender, race/ethnicity, education, income, insulin status, and diabetes duration), completed the Brief Self-Control Scale (BSCS), Adherence to Refills and Medications Scale for Diabetes (ARMS-D), Personal Diabetes Questionnaire (PDQ) to assess eating behaviors, the International Physical Activity Questionnaire (IPAQ), and the Summary of Diabetes Self-Care Activities (SDSCA) blood glucose monitoring subscale, and received a blood-drawn A1c test. We regressed each self-care behavior onto self-control, separately, first unadjusted and then adjusted for patient characteristics and A1c.

Participants (n=64) were 51.5±10.5 years old; 60% female; 61% non-White; 38% had ≤a high school degree, 61% had annual incomes < $35K; 53% were on insulin and reported being diagnosed with T2D for 8.6±6.5 years with an A1c of 8.7±2.0. Participants scored 30.3±5.2 on the BSCS (possible range 8-40). Higher self-control was associated with healthier eating in unadjusted (β=.38, $p < .01$) and adjusted (β =.34, $p < .05$) analyses, and with better medication adherence in unadjusted (β=.28, $p < .05$), but not adjusted (β =.24, p=.12) analyses.

Among adults with T2D, self-control was associated with both better adherence to medications and healthier eating, but was a stronger determinant of eating than taking medication. Self-control may be an overlooked reason some patients with T2D adhere to certain self-care behaviors while others do not. Future studies should examine these associations longitudinally with larger samples and different self-care measures. Finally, examining modifiable predictors of self-care (e.g., self-efficacy) as mediators of associations between self-control and self-care may identify targets for interventions among adults with low self-control.

STRESSFUL LIFE EVENTS AND GLYCEMIC CONTROL IN YOUNG ADULTS WITH T1D

Kevin L. Joiner, PhD, APRN, ANP-BC[1], Robin Whittemore, PhD, APRN, FAAN[2], Margaret L. Holland, PhD, MPH, MS[1], Margaret Grey, DrPH, RN, FAAN[3]

[1]Yale University, Orange, CT; [2]Yale University, School of Nursing, Orange, CT; [3]Yale University, West Haven, CT

Background: For young adults with type 1 diabetes (T1D), stressful life events may impact their ability to achieve glycemic goals, possibly by altering their ability to perform self-management.

Methods: Data from 4,745 participants (age 18 to < 31 years old) in the T1D Exchange Registry were analysed. Report of a stressful life event was defined as one or more positive responses on a 15-item stressful life events index created for use in the registry, and defined as a dichotomous variable (yes-no). Comparisons using Wilcoxon and χ^2 tests were conducted between participants who were classified as having a stressful life event vs. those who did not. Linear regression was used to test associations between stressful life events and A1c levels. Ordered logistic regression was used to test associations between stressful life events and frequency of missing insulin doses. Frequency of missing insulin doses was treated as a categorical variable with 3 values, never/rarely missing a dose (< 1x/week), occasionally missing a dose (1-2x/week), or often/freqently missing a dose (>2x/week). Regression models were adjusted for age, sex, and race/ethnicity.

Results: Nearly half (48.0%) of respondents reported having a stressful life event within the preceding 12-months. The most frequently reported stressful life events were problems at work or school (15.8%), financial problems in the family (14.5%), serious arguments with family members or a close friend (13.9%), and moved to a new home (12.1%). Compared to the group not reporting stressful life events, those that reported stressful life events were more likely to be female, have a lower household income, and have a higher level of educational attainment (all $p < 0.001$). The stressful life event group had a higher mean A1c 8.5±1.8% vs 8.2±1.7% ($p < 0.001$). Compared to a person not reporting stressful life events, an equivalent person reporting a stressful life event was more likely to miss insulin doses >2x/week (13.3% vs 20.0%), and less likely to miss insulin doses < 1x/week (64.5% vs. 54.7%).

Conclusion: These findings may indicate that for young adults with T1D the experience of a stressful life event may increase their risk of poorer glycemic control, possibly by disrupting

performance of self-management. Further exploration of these relationships may allow for the potential for future identifying those at risk and assisting them with more positive approaches to managing stress.

The source of the data is the T1D Exchange, but the analyses, content and conclusions presented herein are solely the responsibility of the authors and have not been reviewed or approved by the T1D Exchange."

ACCULTURATION IS ASSOCIATED WITH RESTRAINED EATING AMONG LATINO ADOLESCENTS

Christopher Johansen, MPH, Kim Reynolds, PhD

Claremont Graduate University, Claremont, CA

Background: Dietary behavior shifts among adolescents as they acculturate from their heritage culture to the receiving culture in the United States. Eating habits such as restrained eating have been understudied in Latino adolescents. As acculturation to the United States increases, exposure to social norms to maintain or lose weight might lead to an increase in levels of restrained eating as a means to control diet and improve weight status. The objective of this study was to explore the influence of acculturation on restrained eating among Latino adolescents in Southern California. It was hypothesized that greater acculturation would be positively associated with greater restrained eating.

Methods: Latino adolescents (*n* = 131) in Grades 9-12, aged 14 to 17 years, at public schools in Southern California were recruited and completed a single self-report survey using mini laptops. Acculturation was assessed using Unger's Acculturation, Habits, Interests Multicultural Scale for Adolescents, 5-item family support for dietary habits scale, and a 10-item subscale from the Dutch Eating Behavior Questionnaire to measure restrained eating. Multiple linear regression tested acculturation on restrained eating controlling for age, gender, BMI, SES and family support for dietary habits.

Results: As acculturation increased, ($B=0.254$, $p < .01$) restrained eating increased as predicted. BMI ($B=0.464$, $p < .01$) and family support ($B=.228$, $p < .01$) were positively associated with restrained eating, while SES ($B=-.199$, $p < .05$) was negatively associated with restrained eating.

Conclusions: Acculturation was positively associated with restrained eating among Latino adolescents. Future research should continue to examine acculturation as a predictor of restrained eating to delineate if this relationship holds in more ethnically diverse populations.

COMPARING MINDFULNESS-BASED WEIGHT MANAGEMENT TO CURRENT STANDARD PRACTICES

Teresa Lee, RD, LD, Kelly H. Webber, PhD, RD, LD

University of Kentucky, Lexington, KY

Background: Comprehensive approaches to weight loss that incorporate behavioral components are needed to address barriers to long-term weight loss maintenance. Investigating the practice of mindfulness as a behavioral tool to enrich weight loss programs is an emerging field of research.

Objectives: The purpose of this study was to compare the effectiveness of a 12-week mindfulness-enriched weight management program to a 12-week standard behavioral weight loss program on changes in weight.

Methods: This was a two-group randomized experimental design study. Adults (n=53) between the ages of 25 and 65 with body mass index between 28 and 45 kg/m^2 were recruited. The pool of participants was randomized into either the standard group or the mindfulness group, and then further subdivided into two smaller groups of 8 to 13 participants each. Each group met once per week for 60 minute sessions with a registered dietitian for twelve weeks. Paired t-tests were used to assess changes over time among participants. Independent t-tests were used to compare changes over time between the two groups. Pearson's correlation coefficient was used to determine associations between variables.

Results: 40 people completed the 12-week intervention. The sample was 90% white, 90% female, 48 ± 11.5 years of age on average, with an average BMI of 33.9 ± 4.3 kg/m^2. At 12 weeks, the mean difference in weight loss between the two groups was not significant (p=.45), with the intervention group losing 8.75 ± 7.8 lbs. and the standard group losing 6.35 ± 6.8 lbs. Mindful eating scores improved by 14% on average in the mindful group versus 6.6% in the standard group (p=0.18). Levels of general mindfulness improved by 6.9% in the mindful group versus 0.8% in the standard group (p=0.326). A change in mindful eating was correlated with weight loss in women (R=0.444, p=0.008), but not men (R=-0.833, p=0.167) in the entire sample.

Conclusions: Both groups produced significant weight loss, however, the two groups were not different at 12 weeks. The impact of change in mindful eating on weight was evident in

women, but not men; this suggests different causal pathways for overeating in women and men.

PERCEPTION VS. REALITY: IS IT MORE EXPENSIVE TO GROCERY SHOP ON A VEGAN/VEGETARIAN DIET?

Jaime Coffino, M.P.H.[1], Sydney Heiss, B.A.[2], Julia M. Hormes, Ph.D.[1]

[1]University at Albany, SUNY, Albany, NY; [2]University at Albany, SUNY, Delmar, NY

Introduction: Adhering to a vegetarian or vegan diet is associated with a range of health benefits, including lower risk of cardiovascular disease, hypertension, and type II diabetes. Despite these health benefits, Americans are predominately omnivores. A common argument against adopting a vegetarian/vegan diet is that it is more expensive than an omnivorous diet. This study aims to examine if there is an empirical basis for this concern by contrasting perceptions of cost of vegan and vegetarian diets with the actual amount of money spent grocery shopping by omnivores, vegetarians, and vegans. **Methods:** Community members (*n*=540, mean Age= 31.12, SD= 12.72, 79.7% female, mean BMI=24.22, SD=5.14) completed a computer-based battery of measures assessing food preferences and eating behaviors. **Results**: Using a paired samples t-test, it was found that omnivores view vegans as richer than themselves (t(158) = 3.31, p = .001), vegetarians view omnivores as richer than themselves (t(76) = -2.16, p = .034), and vegans view both omnivores and vegetarians to be richer than themselves (t(274)= -4.64, p < .001; t(274)= -4.07, p < .001). 52.3% of omnivores (n= 58), 13.3% of vegetarians (n=6), and 5.5% of vegans (n=10) agreed that a vegetarian diet is more expensive than an omnivorous diet [χ^2 = 90.83, *p* = < .001, ϕ=.52]. Similarly, 61.6% of omnivores (n=98) and 41.8% of vegetarians (n=33) thought a vegan diet is more expensive than a vegetarian diet [χ^2 = 8.42, *p* = .01, ϕ=.19]. Despite these perceptions, there were no significant group differences in reported amount of money spent on groceries in an average week (M = 103.86, SD = 78.42 in omnivores vs. M = 110.29, SD = 114.41 in vegetarians vs. M = 103.14, SD = 80.20 in vegans; F(2, 296) =.12, p = .89, = .001). **Discussion:** Although vegan and vegetarian diets are often perceived as more expensive, this study provides evidence that there is no difference in the amount of money spent on groceries per week between omnivores, vegetarians, and vegans. In fact, many countries around the world eat less meat because these diets are more affordable. It is important to educate people on the health benefits associated with adopting a vegan/ vegetarian diet and inform them that the cost barrier is a mere perceived, as opposed to a real, obstacle of adopting this diet.

PROMOTING HEALTHIER CHILDREN'S MEALS AT QUICK-SERVICE AND FULL-SERVICE RESTAURANTS: RESULTS FROM A FEASIBILITY STUDY

Nanette Lopez, PhD[1], Stephanie Anzman-Frasca, PhD[2], Sara Folta, PhD[3], Vanessa Lynskey, MPH[4], Anjali A. Patel, MPH, RD[5], Meaghan Glenn

[1]University of Southern California, San Diego, CA; [2]University at Buffalo, Buffalo, NY; [3]Tufts University, Boston, MA; [4]ChildObesity180 at Tufts University, Boston, MA; [5]Accents on Health, Inc. (dba Healthy Dining), San Diego, CA

Background: Energy dense restaurant foods contribute to childhood overweight. Promoting healthier kids' meals in restaurants may lead to increased sales of these items, thus improving children's nutrition and demonstrating to industry a demand for these items.

Methods: An 8-week intervention using four strategies (toy incentive, placemats, server prompts, signage) to promote healthier kids' meals was implemented at two locations each of a quick-service (QSR) and full-service (FSR) restaurant chain. Convenience samples of 1st-4th grade children and their parents (n=28) were surveyed regarding parent and child perceptions of intervention components. Restaurants' sales of healthier kids' meals were examined before and during the intervention.

Results: Parent and child-reported awareness of intervention components varied, with greatest awareness of the sign and placemat. At the FSRs, the percentage of monthly kids' meals sales from healthier kids' meals was 4.9% at baseline, 8.1% during implementation, and 6.3% at study end. The percentage of monthly sales from healthier kids' entrees at the QSRs increased from 61.7% at baseline to 61.8% during implementation, and ended at 63.1%; however, the percentage of monthly sales from healthier kids' side dishes decreased from 25.0% at baseline to 23.0% at implementation, and ended at 22.9%.

Conclusions: Initial study findings indicate promising strategies for future restaurant interventions, while also uncovering barriers that can inform future work. Given the mixed results for parent and child awareness of intervention components, future studies can build upon these findings and maximize the feasibility, effectiveness, and sustainability of efforts to promote healthier eating in restaurants.

SEVERITY OF DEPRESSIVE SYMPTOMS AFFECTS WEIGHT LOSS GOALS, EATING PATHOLOGY, AND DIETING BEHAVIORS IN COLLEGE WOMEN

Leila Azarbad, Ph.D.[1], Jacey Keeney, M.S.[2]

[1]North Central College, Naperville, IL; [2]Rosalind Franklin University of Medicine & Science, Marseilles, IL

College women are at particularly high risk for dieting and unrealistic weight loss goals, disordered eating, and depressive symptoms. A number of studies have explored how disordered eating behaviors and weight loss goals differ between depressed and non-depressed college women. However, few studies have investigated whether such behaviors and goals differ across various degrees of depressive symptomatology. The purpose of this study was to explore differences in weight loss goals, eating pathology, and dieting behaviors among college women screened as minimally depressed, moderately depressed, and severely depressed.

Methods: Participants consisted of 166 undergraduate women who completed the Center for Epidemiologic Studies – Depression Scale (CES-D), Binge Eating Scale, and Three Factor Eating Questionnaire. Participants also self-reported their dieting histories and self-efficacy, weight loss goals, and eating behaviors. Participants were divided into three groups using CES-D cutoff criteria previously demonstrated to correspond with minimal, moderate, and severe depressive symptomatology. ANOVA and post-hoc testing were used to explore differences among the three groups.

Results: Although there were no significant differences in BMI across the three depression groups, minimally depressed women endorsed a higher percentage of desired weight loss compared to moderately depressed women, $F(2,162) = 4.48$, $p=.013$, as well as greater dieting self-efficacy compared to severely depressed women, $F(2,59) = 2.16$, $p=.043$. Significant differences also emerged with respect to eating pathology, with minimally depressed women reporting lower levels of eating disinhibition than severely depressed women, $F(2,159) = 3.06$, $p=.049$, as well as lower levels of binge eating compared to both other groups, $F(2,157) = 6.65$, $p=.002$. With respect to dieting behaviors, severely depressed women initiated dieting behavior at an earlier age compared to moderately depressed women, $F(2,74) = 3.24$, $p=.044$, whereas moderately depressed women endorsed less weight loss via diet and exercise compared to minimally depressed women, $F(2,74) = 3.21$, $p=.046$.

Discussion: Results suggest that severity of depressive symptoms may affect eating behaviors

and weight loss goals differently in college women. Specifically, those with lower levels of depression may be at the highest risk for unrealistic weight loss goals, whereas those with higher levels of depression may be at the highest risk for eating pathology. Future studies should continue to explore how severity of depressive symptoms affects eating behavior and weight loss in college women, as doing so can allow for enhanced outreach and screening efforts aimed at this population.

THE ROLE OF LATINO CHILDREN'S ACCULTURATION ON THEIR MOTHERS' DIETARY INTAKE AND DIETARY BEHAVIORS

Sandra Soto, MPH, BSN[1], Elva M. Arredondo, PhD[2], Scott Roesch, Ph.D[2], Bess H. Marcus, Ph.D.[3], Holly Shakya, PhD[4], Guadalupe X. Ayala, PhD, MPH[2]

[1]SDSU/UCSD, San Diego, CA; [2]San Diego State University, San Diego, CA; [3]University of California, San Diego, La Jolla, CA; [4]UCSD, La Jolla, CO

Purpose. Though theories posit the importance of family-level factors on health behaviors, the role of children in mothers' dietary intake has received little attention. This study examined the relation between Latino children's acculturation and mothers' dietary intake/behaviors. We also examined the mother-child acculturation gap to identify the types of dyads related to mothers' lower diet quality. **Methods.** Baseline surveys were collected from 361 Latino mother-child dyads enrolled in a family-based dietary intervention. Dyads resided in Imperial County, CA, located on the US-Mexico border. Children were between 7-13 years old. Daily intake of fruits, vegetables, and sugary beverages, percent of calories from fat, weekly away-from-home foods, percent of weekly grocery dollars spent on fruits and vegetables, and summary scores of healthy and unhealthy dietary practices were examined. Bidimensional acculturation was assessed using continuous measures of Hispanic and non-Hispanic dimensions and acculturation groups (assimilated, bicultural, traditional, and marginalized). Three computation methods determined the acculturation gap: a) difference score in acculturation; b) match/mismatch in acculturation groups; and c) interaction between mothers' and children's acculturation scores. Separate regression models with child acculturation or mother-child acculturation gap were tested for each dietary outcome. **Results.** Having an assimilated vs. a bicultural child was inversely related to mothers' vegetable intake and positively associated with the likelihood of engaging in unhealthy dietary practices. The match/mismatch computation method demonstrated the most associations with unhealthy dietary outcomes (sugary beverage servings, percent of calories from fat, away-from-home eating, and engaging in unhealthy dietary practices). Overall, traditional mothers of assimilated children reported lower diet quality than others. **Discussion.** Results suggest that assimilated children may be important to their mothers' dietary intake/behaviors. Researchers should examine the potential mechanisms for how and under which circumstances assimilated children affect their traditional mothers' dietary intake/behaviors.

THE ROLE OF STRESS AND NEGATIVE AFFECT IN FOOD CONSUMPTION FOR INDIVIDUALS WITH COMORBID ADDICTION TO FOOD AND ILLICIT SUBSTANCES

Hannah Tuttle, BA[1], Nisha C. Gottfredson, PhD[2]

[1]University of North Carolina School of Global Public Health, Chapel Hill, NC; [2]UNC Gillings School of Global Public Health, Chapel Hill, NC

Individuals recovering from a substance use disorder (SUD) tend to experience excessive weight gain in the first year of recovery (Cowan et al, 2008). There has been little or no research into the nature of this phenomenon, or its consequences. Koob et al's (1997) theory of spiraling dysregulation suggests that people with food addiction (FA) during the early stages of recovery from a SUD might be prolonging a cycle of negative reinforcement, replacing an illicit substance with unhealthy food, in response to negative affect (NA) or daily stressors. In the long term, continuing the negative reinforcement cycle may lead to relapse.We examine eating patterns of N=108 people in their first 12 months of recovery from alcohol and drugs with an emphasis on 'self-medicating' with food (i.e., non-nutritive eating in response to daily stress or negative affect). We describe who in the sample meets criteria for FA, which was measured using the modified Yale Food Addiction Scale. We then test the hypothesis that who meet the threshold for FA will eat more calories and a diet characterized by a higher glycemic load (GL) on days when they report feeling higher levels of stress and NA.Participants received brief ecological momentary assessment surveys delivered to their personal mobile phones up to 4 times per day for 7 consecutive days. These surveys assessed affect and stress levels in the moment. There were up to 3 of these intensive measurement bursts, each spaced 6 weeks apart. Additionally, participants received a phone call from a trained interviewer to conduct a 24-hour dietary recall each day during the bursts. Nutritional information was coded using NDSR software.Because our outcomes were counts and daily data were nested within individuals, we applied generalized linear mixed models to assess the effect of daily stress, daily NA, and the interaction between daily stress and daily NA with FA on total calorie consumption (controlling for gender and weight) and total GL (controlling for total calories). People with FA, but not those without, consume more calories on days characterized by higher levels of stress. Whereas all people tend to consume a higher GL diet on days characterized by higher levels of NA, this was particularly true for people who met criteria for FA. We characterize participants with comorbid SUD and FA and those with SUD only.

USAGE AND PERCEPTIONS ASSOCIATED WITH HEALTHFULNESS OF VENDING MACHINES IN PUBLIC INSTITUTIONS

Teresa Smith, PhD[1], Holly Dingman, MS, RD[2], Courtney Pinard, PhD[1]

[1]Gretchen Swanson Center for Nutrition, Omaha, NE; [2]Children's Hospital & Medical Center, Lincoln, NE

Energy-dense snack foods are ubiquitous among vending machines, and though school settings have become a recent focus for intervention, little work has been done to assess vending machines at public institutions, worksites, and other key locations such as hospitals. The purpose of this study was to assess the healthfulness, usage and perception, and nutritional standards of vending machines in a sample of 13 public institutions, including hospitals, across a Midwest state. Data were collected using the Nutrition Environment Measures Survey-Vending (NEMS-V) to assess the healthfulness of foods and beverage options, a survey to assess employee perceptions and usage of vending machines at work, and interviews with designated representatives about practices and policies regarding nutritional standards of vending machines at their institutions. Of the 44 vending machines assessed, seven (each at different institutions) received a NEMS-V award because at least 30% of foods or 55% of beverages met nutritional criteria aligning with the 2010 Dietary Guidelines for Americans. Four institutions reportedly engaged in practices or policies with regard to purchasing requirements; placement, promotion, pricing policies; and/or comprehensive nutrient standard(s) for their vending machines, all of which had one award-level vending machine. Of the 520 employees surveyed, 12% reported purchasing food at least once per week and 20% reported purchasing a beverage at least once per week from the vending machine, though 40% reported that they would be more likely to use the vending machine if there were a greater variety of healthful options. While few (20%) reported that they perceived most foods and beverages in the vending machines at work to be healthy, employees of institutions with an award-level vending machines were significantly more likely to perceive the foods and beverages to be healthy ($X^2(1, N = 471) = 66.8$, $p < 0.001$). Given the prevalence of less healthful options available through vending machines, perception of employees that vending machines are relatively unhealthy, and lack of nutritional standards with regard to vending machines, these findings underscore a need for implementing evidence-based nutrition standards for vending machines in public institutions, especially among institutions where vending may be an important source for meals.

ADVOCACY AND INFLUENCE IN A NEW MEDIA LANDSCAPE: WHAT CAN WE LEARN FROM BIG MEDIA DATA?

Eric Leas, MPH[1], John Ayers, PhD MA[2]

[1]University of California, San Diego, San Diego, CA; [2]http://www.johnwayers.com/, Chula Vista, CA

The strategies that experts have used to share information about social causes have historically been top-down, meaning the most influential messages are believed to come from planned events and campaigns. However, more people are independently engaging with social causes today than ever before, in part because online platforms allow them to instantaneously seek, create, and share information. Big data analytics make it possible to rapidly detect public engagement with social causes by analyzing the same platforms from which organic advocacy spreads. To demonstrate these claim we evaluated several high-profile cases covering a range of subjects, including Leonardo DiCaprio's 2016 Oscar acceptance speech citing climate change, Charlie Sheen's HIV status disclosure, Brazilian President Lula's throat cancer disclosure which he attributed to smoking, and Awareness Days such as the Greater American Smokeout and World No Tobacco Day. Using news trends (Bloomberg Terminal news archives), social media (Twitter postings) and information-seeking (Google searches and Wikipedia page views) about the related health issues we can assess the impact of these events. Because these data are freely available in real-time our analytical strategy provides substantial lead time for experts to detect and participate in organic advocacy while an issue is salient. By amending our communication frameworks, building infrastructure for monitoring, and reacting to organic advocacy in near real time, we open novel possibilities for communication advocacy and research. we believe that ignoring organic advocacy and bottom-up communication approaches imperils the effectiveness of media advocacy and, ultimately, public health. The scientific community must adapt to the 21st century dynamic communication landscape and ready itself for the next opportunity to harness the agents of change.

DESIGN CONSIDERATIONS FOR MHEALTH TOOLS FOR SMOKERS NOT READY TO QUIT

Jennifer McClure, PhD[1], Predrag Klasnja, PhD[1], Jaimee Heffner, PhD[2], Sheryl Catz, PhD[3]

[1]Group Health Research Institute, Seattle, WA; [2]Fred Hutchinson Cancer Research Center, Seattle, WA; [3]University of California - Davis, Sacramento, CA

Most smoking interventions—including apps—are designed for smokers who are ready to quit. In contrast, most smokers want to quit someday, but are *not yet* ready, so existing cessation apps do not fully address their needs. If apps were designed for smokers not ready to quit, they could encourage and assist more people in quitting. But little is known about how to design these programs to be appealing and effective. To address this gap, we surveyed smokers online from across the U.S. (n=116) to assess whether they 1) were interested in mHealth tools to help them decide if, when, or how to quit smoking and 2) their preferred app features and functionality. Participants were adults who wanted to quit smoking someday, but were not yet ready to quit, and owned a smartphone. The sample was 72% female, 7% Hispanic, 69% white, and 41% only had a high school degree. Only 3% had downloaded a cessation app, but most were interested in an app to help them reduce smoking (88%) or decide if, when or how to quit (91%). Participants rated the importance and appeal of 35 specific app features, functions, and topical content. We also assessed the maximum they would be willing to pay for this app and what reputational metrics they thought were most important (e.g., app source, recommendation from doctor, user ratings). Features viewed as 'very important' included: password protection, a trusted source, and that the app does not access other personal information. Functions rated as 'very appealing' included: ability to track smoking and spending on cigarettes, earn points/rewards, and redeem these for gifts. Content rated as 'very appealing' included guidance how to quit and help managing withdrawal. Participants generally were not interested in video chat with experts or peers, sharing their progress with family/friends, or connecting via social media. These and other findings will be discussed. Overall, smokers not ready to quit are interested in smoking-focused apps, but their design and marketing may need specific tailoring. Results will be contrasted against findings from similar research with smokers who are ready to quit. Results are relevant to addiction treatment experts, design experts, and software developers interested in mHealth.

DEVELOPMENT OF A MOBILE APP TO ENGAGE AND EMPOWER BREAST CANCER PATIENTS

Tina L. Harralson, PhD[1], Kristen Scott, RN,BSN[1], Cori E. McMahon, PsyD[2], Mark Redlus, BS[1]

[1]Polaris Health Directions, Wayne, PA; [2]Cooper University Hospital/ MD Anderson Cancer Center at Cooper, Camden, NJ

Background: The emPower mobile application (App) was developed to engage and support breast cancer (BC) patients by increasing awareness of emotions, physical symptoms, and physical activity. The App offers a mobile connection between the patient, care team and other BC patients via the Apple Watch and iPhone. Procedure: To test the feasibility and acceptability of a native iOS App in a clinical setting, patients in active treatment for BC were recruited between Dec 2015-May 2016. Participants were given an Apple Watch and an iPhone 5s with a service plan, if they did not own an iPhone. Group training sessions were held at the Cancer Center lasting about 3 hours: approximately 1 hour of training/questions and 2 hours of socialization. Participants were alerted daily to complete a brief check-in on the Watch or Phone regarding subjective wellbeing, distress, pain, fatigue, sleep quality. They also received a daily “inspiration” and choice of physical, social, or mindfulness “challenge.” Optional questions regarding daily physical symptoms could be completed on the Phone if desired. Participants were also prompted to complete weekly and bi-monthly study questions on the Phone: 1) a weekly social support check-in, and 2) questions pertaining to depression (PHQ2) and anxiety (GAD2) every 2 weeks. The App interfaces with the Apple “healthkit,” which passively obtains active calories and steps from the Watch. Distress, pain, fatigue and active calories were presented in an interactive graph on the Phone revealing to the participant the interrelationships between these variables. This data was also available to the care team. Results: Twenty women with various stages of BC were enrolled in the study. Mean age 50 years (range= 27-66 yrs.); 80% White, 20% African American. Intake assessment completed at enrollment indicated 60% moderate to severe distress, 15% moderate to severe anxiety (GAD7), 20% moderate to severe depression (PHQ9). Data analyzed during the first 4 weeks of use indicated a trend toward increased number of steps taken (Week 1: Mean= 4262 steps, s.d.=3766; Week 4: Mean=5116 steps, s.d.=4293; p=.06) and a slight increase in active calories (Week 1: Mean= 215 calories, s.d.=128; Week 4: Mean=241 calories, s.d.=150; p= ns). Since the participants were in various stages of cancer and treatment, the small changes in activity were expected. Issues encountered during the study mainly pertained to use of Watch and Phone. Participants were evenly split regarding who completed check-ins on the Watch or Phone. Conclusion: Overall, the use of the emPower App proved feasible in a clinical setting and feedback from participants has been positive. One of the most advantageous features

noted by participants was support and knowledge gained from the cohort. This App can be adapted to all types of cancer as well to other chronic diseases.

HEALTH IT TO INCREASE PATIENT ACTIVATION: DEVELOPMENT AND USABILITY OF A PATIENT-FACING, DIABETES DASHBOARD

William Martinez, MD, MS

Vanderbilt University Medical Center, Nashville, TN

Background
This study aimed to develop and evaluate a patient-facing, diabetes dashboard embedded within an existing patient portal tethered to an electronic health record system to display social and goal-based comparisons of users’ diabetes health data and increase patient activation and improve self-management.

Methods
We performed a qualitative evaluation consisting of semi-structured interviews with 6 stakeholders and key informants (e.g., patient, endocrinologist, primary care physicians, nurse, diabetes educator, health psychologist) to discern content, support needs, and preferences regarding dashboard features and tools. We used grounded theory to analyze these interviews for themes. After prototype design, we conducted usability testing under controlled conditions with 8 patients with type 2 diabetes mellitus. Each patient participated in a single usability session using a “think aloud” process. Patients preformed standardized tasks within a dashboard prototype displaying fictitious patient data. Sessions were audio recorded and computer screen activity was captured using QuickTime Player. Transcripts and recordings were evaluated for common themes. Following testing, patients completed the Computer Usability Satisfaction Questionnaire which assessed their perceptions of the dashboard’s ease of use and the likability of the interface using a 7-point Likert scale, with seven indicating the highest possible satisfaction.

Results
Results showed that stakeholders and key informants desired a dashboard that: (1) displays diabetes health data in ways that facilitate patient understanding and promotes patient activation, (2) facilitates patient action in response to the data they see (e.g., request a test or vaccine, seek advice from their doctor), (3) provides diabetes education relevant to the data being displayed, and (4) facilitates goal setting, tracks progress, and celebrates accomplishments. Usability testing revealed problems with navigation, intuitiveness, design, and terminology. Satisfaction was greatest for "easy to learn to use" (mean 6.6) and lowest for "organization of information is clear" (mean 5.0). Overall mean satisfaction scores improved between prototype iteration one and two (means, 5.9 vs. 6.6).

Conclusions

This study demonstrated that diabetes stakeholders desire a patient-facing, diabetes dashboard that facilitates patients' understanding of their diabetes-related health data and facilitates and track action. Task-based usability testing demonstrated difficulties in navigation, medical language complexity, and organizational schema which led to improvements. The current study also demonstrates that usability testing can assist in making healthcare application interfaces for patients more useable and potentially more usefull.

ONE DROP MOBILE APP USERS REPORT IMPROVED GLYCEMIC CONTROL

Jeff Dachis, MA[1], Chandra Osborn, PhD, MPH[2], David Rodbard, MD[3], Brian Huddleston, JD[4]

[1]Informed Data Systems Inc., New York, NY; [2]One Drop, Informed Data Systems Inc., Nashville, TN; [3]Biomedical Informatics Consultants LLC, Potomac, MD; [4]Informed Data Systems Inc., Austin, TX

Objective: Most mobile health apps lack scientific evidence. The One Drop mobile app offers tracking of diabetes self-care behaviors and blood glucose (BG) values manually or automatically via Bluetooth-enabled meters, CGMs, and other health apps. The app includes a robust food library, medication scheduler, recipes, health tips, user polls, and community support ('likes', stickers, and data sharing). Users specify BG and self-care goals, and receive data-driven insights to draw connections between behaviors, goals, self-reported hemoglobin A1c and weight. In July 2016, we assessed A1c change among One Drop users self-reporting a diabetes diagnosis.

Method: We queried data on ~50,000 users, identifying those users with two A1c values at least 60 and no more than 365 days apart. A two-sided paired t-test assessed changes from first to last A1c. Two-sided independent t-tests assessed gender and diabetes type differences on the A1c change score, and Spearman's correlation coefficients assessed relationships between diabetes duration, tracking data, and A1c change.

Results: The sample included 133 users (63 males), including 41 with type 1 (T1D) and 88 with type 2 diabetes (T2D). Average diabetes duration was 12.4 ± 10.8 years with 44.2% using insulin and 50.4% using the One Drop medication scheduler. The average time interval between A1c values was 146.1 ± 76.7 days, with 3,225 ± 5,780 (range: 2-37,838) tracking entries during that period. A1c improved significatly from initial (7.8% ± 2.1%) to final period (7.1% ± 1.3%), two-sided $t=4.2$, $p < .001$, and the change in mean A1c was similar irrespective of gender or diabetes type. However, subgroup analyses by diabetes type revealed substantial A1c improvement among people with T2D (7.7% ± 2.2% vs. 6.9% ± 1.2%; $t=4.0$, $p < .001$), with a trend of improvement among people with T1D (8.0% ± 2.0% vs. 7.5% ± 1.3%; $t=1.7$, $p=0.09$). Changes in A1c were not associated with duration of diabetes or tracking intensity.

Conclusion: People with diabetes using the One Drop health app reported a nearly 0.70% reduction in A1c during 2-12 months of using it. Mean A1c change did not differ by gender or

diabetes type. Ongoing analyses of user data combined with results from a third-party trial will provide further evidence of One Drop’s self-care and clinical value.

PERCEPTIONS OF SOCIAL MEDIA ENGAGEMENT AND SOCIAL NORMS FOR WEIGHT LOSS

Melissa Napolitano, PhD[1], Meghan Mavredes, MPH[1], Laura L. Hayman, PhD, RN, FAAN, FAHA[2], Samuel J. Simmens, PhD[3], Jessica Whiteley, PhD[4]

[1]The George Washington University, Washington, DC; [2]University of Massachusetts Boston, Boston, MA; [3]George Washington University, Washington, DC; [4]UMass Boston, Boston, MA

Background: Examining social media engagement and encouragement as it relates to body weight can provide a channel for understanding the relative influence and impact of social contacts. Purpose: Assess and examine social media engagement, social norms for weight loss, and determine influences and differences by weight status or sex. Method: University students (N=165; mean age=21.8+3.1 years; mean BMI=31.7+3.6 kg/m^2; %female=80%; % non-white=42.4) completed: demographics, social norms for weight loss (i.e., social contacts approve or disapprove of weight loss/provide weight loss information or tools); social media engagement (6-items: “Facebook is part of my every day activity”, “I’m proud to tell people I’m on Facebook”, “I feel out of touch when I haven’t logged into Facebook”, “I feel I am part of the Facebook Community”, “I would be sorry if Facebook shutdown; “Facebook has become part of my daily routine” Cronbach’s alpha=.836). Results: Almost all (98.5%) reported close social contacts would somewhat or strongly approve if they were to lose weight, yet 79.1% reported close social contacts rarely or never provided weight loss information or tools. There were no differences in social norms for weight loss by weight status (overweight vs. obese) or sex. Most endorsed high levels of social media engagement, agreeing or strongly agreeing with Facebook being a routine (78.7%) and daily activity (82.9%), feeling Facebook proud (82.9%) and part of a community (57.7%), and disappointed if Facebook no longer existed (53.8%); yet, only 46.2% reported they would feel out of touch without Facebook. There were no differences in social network engagement by weight status or sex. Chi-square analyses examined the relationship between perceptions of social norms and social networking engagement. When examining the social norm of contacts approving of weight loss, there were significant results for Facebook being a part of one’s routine, a daily activity, and feeling proud to be part of Facebook (p’s < .05). No significant differences were found for the social norm of contacts providing weight loss assistance and social networking engagement. Discussion: Although most reported social contacts approved of weight loss, few reported contacts provided tangible weight loss support. Future studies are needed to examine the directionality of the relationship between approval of weight loss by social contacts and level of engagement in social networks.

PREDICTORS OF ENGAGEMENT WITH A SMOKING CESSATION APP

Kisha I. Coa, PhD, MPH[1], Ellen Beckjord, PhD, MPH[2], Maria Asencio, MS[3], Jason Choi, MS in Data Science [3], Brian Keefe, MA[1], Augustson Erik, PhD, MPH[4]

[1]ICF International, Rockville, MD; [2]UPMC Health Plan, Pittsburgh, PA; [3]ICF International, Fairfax, VA; [4]National Cancer Institute, Rockville, MD

Background: Mobile phones are increasingly being used to deliver smoking cessation interventions. One factor that limits the potential effectiveness of these programs is lack of maintained use of mobile cessation apps ("engagement"). There is a need to better understand factors that are associated with higher engagement with smoking cessation mobile health interventions.

Objective: To examine patterns of use and functionality that are associated with engagement among users of an evidence-based, publicly available smoking cessation app, QuitGuide.

Methods: Individual-level Google Analytics event data tracking and time stamping captured each user action in the app between August 2015 and June 2016. Classification and regression tree analysis (CART) was used to construct a model predicting the number of days a user was active in the app.

Results: 9,348 unique users downloaded the app. Most users were daily smokers (90.5%), reported their cravings were highest in the morning (51.0%), and smoked a mean of 16.2 cigarettes per day. Users were active in the app between 1 and 181 days – with more than half of users only being active 1 day (40.6%) or 2 days (18.9%). In the app, users can report being smoke free, a slip, a craving, or their mood. Tracking cravings and reporting mood were the most used features (53.0% of users reported each). CART analysis identified nine unique groups with varying average number of days in the app. Those who were active in the app for more days more frequently: (1) returned to the app after receiving local notifications (i.e., reminders encouraging to return to the app for support or tips); (2) reported being smoke free; and (3) tracked their cravings.

Conclusion: These findings suggest that specific features – local notifications and self-monitoring (days smoke free, cravings) – may encourage users to maintain use of a smoking cessation app. Also, particular support may be needed for individuals to maintain use of a cessation app beyond one or two days and before they achieve initial abstinence.

PROSTATE CANCER PATIENTS’ INFORMATION TECHNOLOGY USE, PREFERENCES AND NEEDS: A CROSS-SECTIONAL POPULATION BASED SURVEY

Jacqueline L. Bender, BSc, MSc, PhD[1], Deb Feldman-Stewart, PhD[2], Christine Tong, BScH, BEd, MA [2], Howard Pai, MD[3], Jacky WY. Au, BSc[1], Michael D. Brundage, MD, MSc[4], John W. Robinson, PhD[5], B. Joyce Davison, BN, MN, PhD[6], Arminee Kazanjian, DrSoc [7]

[1]Princess Margaret Cancer Centre, University Health Network, Toronto, ON, Canada; [2]Queen's University, Kingston, ON, Canada; [3]BC Cancer Agency – Vancouver Island Centre, Victoria, BC, Canada; [4]Queen’s University, Kingston, ON, Canada; [5]Tom Baker Cancer Centre and University of Calgary, Calgary, AB, Canada; [6]University of Saskatchewan, Saskatoon, SA, Canada; [7]University of British Columbia, Vancouver, BC, Canada

Objective: To determine how prostate cancer patients want to use the Internet for information and support, and barriers and facilitators to use.

Methods: Surveys were conducted in three provinces in Canada (BC,AB,SK) in 2014-15, using a modified Dillman mail-survey methodology. A random sample of ~55% of the population of men in each provincial registry diagnosed with prostate cancer in the last half of 2012 was surveyed.

Results: Response rates ranged from 46%-55% (N=1007). Mean age was 69 years old. 76% used the Internet, and 63% used the Internet daily. Younger age, higher education, higher income, urban residence and broadband Internet access were associated with Internet use. 74% accessed the Internet with a desktop/laptop 32% with a tablet, and 28% with a smartphone. 53% found it easy to get information from the Internet. 37% agreed that they felt confident using information from the Internet to help make health decisions (eHealth literacy). 31% felt that their confidence in using the Internet to help make health decisions had increased since being diagnosed with prostate cancer. Greater eHealth literacy was associated with better self-reported health status. From a list of 10, top barriers to using the Internet relate to low eHealth literacy inluding: not knowing what to trust (46%); not knowing if it was personally relevant (41%); and not knowing how/ where to search (20%). If access were easy, 58% would want to use the Internet for prostate cancer information. If there was a website designed specifically for men with prostate cancer, 20% would not use it. From a list of 13, top 5 features wanted in such a website were: library (64%); decision support tools (57%); navigation support tools (49%); links to trusted websites (46%); and health assessment

tools (43%). 28% would want it to include an online peer support forum. In this website, 50% or more would want information on: prostate cancer treatments (65%); disease progression (64%); how to manage treatment side effects (61%); personally tailored information (54%); and latest research (53%). Top facilitators for using such a website were: telephone support (40%); using the website with a family/friend (28%); or a personal/group training session (25-24%).

Conclusions: The majority of prostate cancer patients want to use the Internet as a source of information about prostate cancer, but many do not know what information to trust or how to find personally relevant information. To be optimal, prostate cancer websites should offer tailored health information focusing on treatment options and side effects, and include decision support tools and telephone technical support.

USE AND ACCEPTANCE OF A MOBILE APPLICATION TO PREVENT ALCOHOL MISUSE AMONG MILITARY PERSONNEL

Cynthia Simon-Arndt, MBA, MS[1], Suzanne Hurtado, MPH[2], Mary Jennifer McAnany, PhD[1], Emily Schmied, PhD, MPH[1]

[1]Naval Health Research Center/LEIDOS, San Diego, CA; [2]Naval Health Research Center, San Diego, CA

Background: Alcohol misuse is a serious and growing issue among active duty military servicemembers. There are many barriers to implementing military alcohol interventions, such as the organizational drinking culture, stigma against substance abuse treatment, and the transient lifestyles of servicemembers. The accessibility of mobile health applications (“apps”) offers a unique approach to reaching servicemembers, yet no prior research has examined the feasibility of employing this tool for alcohol misuse prevention in a military setting. The objective of this study was to assess the use and acceptance of a mobile app for alcohol misuse among servicemembers.

Methods: An original app, *Alcohol Determinator*, was developed specifically for Marines. App content was based on the principles of brief intervention and included five components: self-assessment with feedback, drinking log with goal-setting, blood-alcohol content (BAC) calculator, information, and resources. One-hundred fifty-eight active duty Marines were randomly assigned to an intervention group (n=65; 89.1% male, 49.2% White) or an attention control group (n=93; 86.8% male, 50.0% White). The intervention group received *Alcohol Determinator* and the control group received a popular fitness app. After one month, user ratings and app usage data were collected for both study groups via in-app tracking and electronic surveys.

Results: A majority of intervention participants agreed the app was easy to use (82.7%), was appropriate for Marines (74.5%), and would recommend it to another Marine (75.0%). In terms of content, intervention participants were most satisfied with the BAC calculator, feedback on money spent on alcohol and the drinking log charts. Group comparison tests showed intervention participants used the app less often than control participants during the observation period (p.05).

Conclusions: Servicemembers used and favorably reviewed the *Alcohol Determinator.* Mobile apps to prevent alcohol misuse built on evidence-based principles may be an appropriate intervention for this unique, at-risk population.

USING MHEALTH APPS IN SELF-MANAGEMENT INTERVENTIONS TO PROMOTE PHYSICAL ACTIVITY: RANDOMIZED CONTROLLED PILOT STUDY

Matthew Plow, PhD, Meghan Golding, BS

Case Western Reserve University, Cleveland, OH

Purpose: Examine the effectiveness of using commercially available mHealth apps in a self-management intervention to promote physical activity in 46 adults with mobility-impairing musculoskeletal or neurological conditions, such as arthritis, multiple sclerosis, and fibromyalgia.

Methods: Participants were randomized to one of three groups: (1) mHealth-based self-management intervention, (2) paper-based self-management intervention, and (3) contact-control intervention. All three interventions consisted of one in-person visit plus three phone calls over a six week period. Participants in the mHealth and paper-based intervention groups received a Google Nexus Tablet or a paper diary, respectively, to facilitate goal-setting, self-monitoring, and action planning. Participants in the control intervention received information on healthy behaviors without being taught self-management skills. Outcomes were administered at baseline and seven weeks. Three MANOVAs were conducted: (1) self-report physical activity (planned exercise and leisure-time physical activity, general physical activity, and employment physical activity), (2) psychosocial constructs (self-efficacy, self-regulation, and social support), and (3) physical function (PROMIS, 6-Minute Walking Test, chair stands, and arm curls).

Results: Both the mHealth and paper-based interventions had significant (Wilks' $\lambda = 0.71$, $F_{6, 76} = 2.34$, $P = .04$) and large effect size increases in planned exercise and leisure-time physical activity compared to the control intervention (Cohen’s d = 1.20 and d = 0.82, respectively). The mHealth-based intervention had non-significant but small to moderate effect size increases in planned exercise and leisure-time physical activity compared to the paper-based intervention (Cohen’s d = 0.47). Both the mHealth and paper-based interventions had non-significant (Wilks' $\lambda = 0.85$, $F_{6, 76} = 1.10$, $P = .37$) differences but moderate effect size improvements in self-efficacy (d = 0.48 and d = 0.75; respectively) and self-regulation (d = 0.59 and d = 0.43, respectively) compared to the control intervention. There were no significant changes in physical function within and between the three interventions. Participants were significantly ($P = .02$) more likely to track physical activity behaviors using the paper diary compared to the Google Nexus Tablet.

Conclusions: This study demonstrates the feasibility of conducting a larger randomized controlled trial to examine the use of mHealth apps in self-management interventions. We found that using commercially available mHealth apps in self-management interventions shows promise in promoting physical activity in adults with neurological and musculoskeletal conditions. Further research is needed to improve the usability of mHealth apps for adults with neurological and musculoskeletal conditions.

VIRTUAL GARDENING PILOT INTERVENTION INCREASES SELF-EFFICACY TO COOK AND EAT FRUITS AND VEGETABLES IN MINORITY YOUTH

Brooke Bell, BA[1], Lauren C. Martinez, PhD[2], Marientina Gotsis, MFA[1], H. Chad Lane, PhD[3], Jaimie Davis, PhD[4], Luz Antunez Castillo, MBA[1], Giselle Ragusa, PhD[1], Donna Spruijt-Metz, MFA, PhD[1]

[1]University of Southern California, Los Angeles, CA; [2]University of Southern California, Pasadena, CA; [3]University of Illinois, Urbana-Champaign, Champaign, IL; [4]University of Texas at Austin, Austin, TX

African American and Hispanic youth in Los Angeles have significantly higher rates of overweight and obesity than is reported for these children nationwide. Intake of fruits and vegetables (FV) has been inversely associated with body weight. School gardening programs have shown success in increasing preference of and improved attitudes towards FV, however implementation in urban settings has several limitations. Virtual Sprouts (VS) is a virtual gardening game developed for minority youth and their families. VS teaches users about FV, nutrition, gardening, and cooking through meaningful play.

In this quasi-experimental pilot intervention, elementary school students were enrolled in a 3-week program that included three VS gaming sessions, three in-school lessons, and three in-home activities, using a nutrition- and gardening-focused curriculum. Pre- and post-intervention questionnaires were used to assess psychosocial determinants of dietary behavior, including knowledge about and self-efficacy to eat FV. Data was collected on FV, whole grains, fiber, total sugar, added sugar, and energy from sugar beverages intake via the Block Kids Food Screener (‘last week’ version). Repeated-measures analysis of covariance models was used for continuous outcomes, controlling for age, sex, ethnicity, school, and free school lunch. Ordinal logistic regression was used for binary outcomes with the same covariates.

180 students from 3rd, 4th, and 5th grade classrooms in two Los Angeles Unified School District schools were randomized into intervention and control groups. After the intervention, the intervention group (n=116) had an improved self-efficacy to eat FV score (p=0.01), an improved self-efficacy to cook score (p=0.05), but not a significantly improved self-efficacy to garden score. There were no significant differences in dietary intake between intervention and control groups.

The results from this 3-week pilot study suggest that a virtual gardening game with a nutrition- and gardening-focused curriculum can improve psychosocial determinants of dietary behavior in minority youth.

COMMUNITY KNOWLEDGE OF SOCIAL DETERMINANTS OF HEALTH

Rachel Barth, MSW, Nikole Lobb Dougherty, MA, Emily Kryzer, MSW, MPH, Jasmine L. Williams, MPH, Jason Purnell, PhD, MPH

Washington University in St. Louis, St. Louis, MO

Background: Following the publication of a reporton the health and well-being of African Americans in St. Louis in May 2014, the *For the Sake of All* initiative has focused on engaging and disseminating information to community to increase knowledge of social determinants of health (SDH). Engagement approaches included community feedback meetings, discussion guides, action toolkits, and Community Action Forums (forums).

Methods: Six forums were held at community sites throughout St. Louis from October 2014 through June 2016. Each forum engaged community in a discussion of the impact of SDH on regional health disparities. Forum attendees' self-reported attitudes toward SDH were assessed upon forum registration (pre-event) and approximately 12-weeks following (post-event). Dissemination reach as well as reported changes in attitude were aggregated and assessed.

Results: A total of 426 people have attended the first four forums. Attendees have come from 36 unique zip codes and have been predominantly female (63%-84%), highly educated (70%-86% with at least a bachelor's degree), and affiliated with a community organization (23%-45%) and with higher education (14%-21%). In terms of race, between 41% and 53% of attendees have been white, 25%-34% black, 5%-7% other, and 15%-20% unreported. Each forum draws between 48% and 57% new attendees.

Preliminary results from paired samples t-tests comparing mean differences in pre- and post-event responses indicate small but significant changes in attitude regarding the extent to which health is affected by level of income (Pre M = 8.71, SD = 1.84, Post M = 9.45, SD = 1.00; $t(72) = -4.21$, $p < .001$), level of education (Pre M = 8.03, SD = 1.78, Post M = 8.95, SD = 1.33; $t(72) = -4.99$, $p < .001$), community safety (Pre M = 8.49, SD = 1.71, Post M = 9.27, SD = 1.06; $t(70) = -3.80$, $p < .001$), and having health insurance (Pre M = 8.85, SD = 1.68, Post M = 9.25, SD = 1.16; $t(72) = -2.37$, $p = .02$).There were no significant changes with respect to the influence of personal health practices, access to affordable care, or genetic makeup on health (all *p*s > .05).

Discussion/Conclusion: Public discourse about improving health has long focused on

improving access to health care and on individual health behaviors. Engaging community members in targeted education and discussion about the impact of SDH on health is one method by which public health researchers can shift this discourse to focus on advancing social and economic policy.

COMMUNITY TO CLINIC NAVIGATION TO INCREASE COLON CANCER SCREENING: A DISSEMINATION/IMPLEMENTATION MODEL

Usha Menon, PhD, RN, FAAN[1], Linda K. Larkey, PhD[2], Laura Szalacha, EdD[1]

[1]University of Arizona, Tucson, AZ; [2]Arizona State University, Phoenix, AZ

Community to Clinic Navigation to Increase Colon Cancer Screening: A Dissemination/Implementation Model

Usha Menon, PhD, RN, FAAN[1]; Linda Larkey, PhD[2]; Laura Szalacha, EdD[1]

[1] The University of Arizona

[2] Arizona State University

Background: Regular screening facilitates early diagnosis of colorectal cancer (CRC) and contributes to reduction of CRC morbidity and mortality. Recent increases in CRC screening utilization are not mirrored in poor and minority populations. CRC screening rates are particularly low for those without a primary care provider or clinic and who also have lower levels of education, income, and insurance. A large proportion of ethnically diverse and poor patients do not regularly visit primary care clinics, further lowering their likelihood for getting screened and underscoring the need to reach this population with effective interventions in community settings.

Purpose: We developed and tested a community to clinic tailored navigation intervention using a dissemination (randomized phase one) and implementation (non-randomized phase two) framework targeting low-income, diverse communities. The final outcomes were: a) clinic attendance, b) CRC screening, and tracking RE-AIM factors of dissemination.

Methods: We randomized 239 community sites to Education + Tailored Navigation (TN) and 116 to Education only. In phase one, all participants received education on CRC risk and screening. Those in the Education only group received up to 5 calls to inquire about appointments/screening. Those in the Education + TN group received up to 5 calls from navigators who assisted them with barriers using a tailored message bank, guiding them to schedule a clinic appointment. In phase two, all those who attended a clinic, regardless of previous group assignment, received TN from a trained study navigator to guide them to complete screening.

Results: Of the 416 participants who completed the baseline survey (53% Female, 47% Male, Mean age 61.5; SD=7.4; 52.7% Latino, 36% Uninsured); 25%; (n = 104) made clinic appointments, and 80% of these participants (n=65) completed a screening test. Overall, the Education + TN participants were 6 times more likely to get screened (54/209, 25.9%, OR = 6.28) than were Education alone participants (11/207, 5.3%).

Conclusions: Adding TN to community education was significantly more efficacious than Education alone, indicating TN was successfully translated into the community setting, with continuing implementation in the clinics to increase CRC screening rates. Reach, effectiveness, adoption, implementation and maintenance data will be discussed.

EXAMINING PARENT ENGAGEMENT IN A FAMILY-BASED CHILDHOOD OBESITY INTERVENTION: A QUALITATIVE STUDY

Emily Schmied, PhD[1], Emmeline Chuang, PhD[2], Hala Madanat, PhD[1], Jamie Moody, MS[3], Leticia Ibarra, MPH[4], Guadalupe X. Ayala, PhD, MPH[1]

[1]San Diego State University, San Diego, CA; [2]University of California, Los Angeles, Los Angeles, CA; [3]Institute for Behavioral and Community Health, San Diego, CA; [4]Clinicas de Salud del Pueblo, Inc, Brawley, CA

Background: Low parent engagement, or limited attendance at or active participation in planned program activities, is often cited as a barrier to the implementation and ultimately, the efficacy of family-based childhood obesity prevention and control programs. This qualitative study examined factors influencing parent engagement in a family-based childhood obesity prevention and control program.

Methods: Participants included 22 mothers (mean age=34.8 years) enrolled in a family-based childhood obesity prevention and control program. Semi-structured interviews guided by the Health Belief Model and Transtheoretical Model assessed parents' motivation for participating, facilitators and barriers to participation, and satisfaction with the program. Interviews were conducted in participants' language of choice (English=13.6%; Spanish=86.4%) in person (31.8%) or via phone (62.2%) following the conclusion of program activities. Interviews were transcribed and summarized. Data were analyzed for differences between parents who attended at least two-thirds of program activities ("high engagement") and those who did not ("low engagement").

Results: There were no significant demographic differences between parents who did and did not complete two-thirds of program activities. Parent engagement was influenced by children's level of support and enthusiasm for the program, and by parental expectations of program benefits to the family. Parents were highly satisfied with the program's content and the community health workers who delivered the program.

Conclusions: This study adds to emergent literature regarding parents' experiences in family-based childhood obesity prevention and control programs. Findings identify potential targets for improving engagement, such as strategies to engage additional family members to increase the support received by the participating parent.

FEASIBILITY AND ACCEPTABILITY OF GROUP VISIT FOR DERPRESSION IN PRIMARY CARE

Sona Hovsepian, MSW, ASW[1], Megan Johnson, MD[2], Sonya Gabrielian, MD, MPH[1], Alexander Young, MD, MSHS[1]

[1]Veterans Health Administration, Los Angeles, CA; [2]Kaiser Permanente, Los Angeles, CA

Background: Depression is common in primary care settings and is often chronic, recurring, and comorbid with chronic medical illness. Improving outcomes for depression and chronic medical illnesses requires patients to become educated, active partners in their care. Outpatient psychiatric care is frequently characterized by brief, infrequent individual medication management visits that often fall short of providing guideline-concordant care. Such visits are also insufficient for helping patients with chronic illnesses gain the knowledge, skills, and self-efficacy needed to promote treatment adherence and self-care.

Objective: To assess the feasibility and acceptability of a group visit for depression ("Medication and Self-Management to Empower Recovery (MASTER)") within primary care settings.

Methods: Within the VA Greater Los Angeles' patient-centered medical home, psychiatrists referred patients ≥ 18 years old with depression. Participants were scheduled for a series (16 weeks) of group appointments for depression in VA primary care. Each group was 90 minutes, split between psychoeducation, mindfulness, and a round-robin for medication adjustment and discussion of side effects for each patient. PHQ-9 scores were performed at baseline and group completion. Semi-structured questionnaires at the end of the 16 weeks and qualitative interviews at 3 months follow-up assessed patient experience of the groups, barriers and facilitators, and recommendations.

Results: Of the 9 veterans enrolled, a subsample (n = 6) ultimately completed an average of 7.8 support groups. 5 of the veterans completed the 3 month qualitative interviews. Veterans who completed the interviews would recommend the group to a peer. Some of the Veterans discussed additional topics they would like in the support groups; these were, veterans of different war eras, introduction to relaxation music, pain management for specific conditions. Veterans saw and average of 10.2 points improvement in their PHQ-9 score during the 16 weeks, identified enjoyable activities and coping skills at each session.

Discussion: Group visits for depression were feasible and acceptable in primary care. Veterans with a diagnosis of depression reported that they benefitted from depression support groups. This pilot experience suggests the need for a larger trial to assess the effectiveness of this hybrid treatment model medication management and group self-management support in primary care setting.

HEALTHY EATING ACTIVE LIVING: PILOT STUDY OF A MULTI-COMPONENT COMMUNITY-BASED PROGRAM AMONG LOWER-INCOME PREGNANT WOMEN

Shreela Sharma, PhD RD LD[1], Ru-Jye Chuang, DrPH[2], Courtney Byrd-Williams, PhD[3], Gregory Bounds, MPH[1], Sania Durrani, B.S., B.A.[4], Deanna M. Hoelscher, PhD, RD, LD[5]

[1]University of Texas School of Public Health, Houston, TX; [2]UTHealth School of Public Health, Houston, TX; [3]University of Texas School of Public Health, Austin, TX; [4]The University of Texas Health Science Center at Houston, School of Public Health, Friendswood, TX; [5]University of Texas School oF Public Health, Austin, TX

Healthy Eating Active Living (HEAL) is a multi-component, community-based, community health worker(CHW)-led six-week program designed to promote healthy eating, physical activity, and intention to breastfeed among Medicaid-eligible pregnant women in Houston, TX. Pregnant women are recruited through clinics and participate in weekly 90-minute facilitated and experiential, group-education sessions. The purpose of this pilot study is to evaluate the feasibility and effectiveness of HEAL in improving participants' dietary habits, home nutrition environment, and time spent in physical activity (PA), and intention to breastfeed.

This was a one-group pre-post evaluation design. Availability of fruits and vegetables (FV) (23 items), daily consumption of FV (24 items) and sugar-sweetened beverages (SSB) (1 item), perception (1 item) and frequency (2 items) of PA, and intention to breastfeed (4 items) were measured using self-administered surveys. Ninety-two Medicaid-eligible pregnant women completed both pre-and post- surveys from October 2014-September 2015. Wilcoxin signed-rank test and McNemar's test were conducted to evaluate pre- and post-intervention changes. Process evaluation was conducted weekly using participant surveys to assess program acceptability, and from CHWs through post-session facilitator survey to evaluate program fidelity.

Results showed that participation in HEAL significantly increased home availability of 11 FV ($p < 0.05$), daily FV consumption ($p < 0.05$), and decreased SSB consumption ($p < 0.05$). At post-intervention, significantly more women reported being physically active ($p < 0.05$), and being physically active for over 30 minutes per day ($p=0.03$), and at least 10 minutes at a time ($p < 0.05$). Significant increases in attitude and perceived benefit of breastfeeding ($p < 0.05$) were found at post-intervention, but not in intention to breastfeed. Among women intending to breastfeed, more women planned to continue after returning to work/school ($p < 0.05$).

Process evaluation showed that participants found HEAL sessions very helpful in improving their health behaviors (mean= 3.83, possible score range 0-4). Post-session facilitator survey showed high fidelity of program components (discussion topics 98.9%, physical activity 95.8%, and recipe demonstration 100%).

This pilot study demonstrates the initial feasibility and success of creating successful clinic-community linkage and using a CHW-led intervention to improve health behaviors among low-income pregnant women.

SUSTAINED IMPLEMENTATION OF A BIOBEHAVIORAL INTERVENTION BY COMMUNITY PROVIDERS

Marlena Ryba, PhD[1], Brittany Brothers, PhD[2], Stephen Lo, M.A. [1], Barbara L. Andersen, PhD[1]

[1]The Ohio State University, Columbus, OH; [2]Indiana University, Bloomington, IN

Background. There is accumulating research on dissemination and implementation (DI) of evidence based treatments (EBTs) for mental health. However, there is a paucity of research regarding the sustainability of these interventions. In the context of a DI effort, mental health professionals completed a 3-day training institute in an evidence-based biobehavioral intervention (BBI) for cancer patients aimed at reducing stress and enhancing mental health. Training was effective (Brothers et al., 2015) and clinicians were provided 6 months of implementation support (e.g. conference calls, web resources). **Purpose.** This study aimed to examine the 12 month sustainability of the providers' usage of the BBI. **Methods.** Providers in social work, psychology, and other licensed mental health professions from large medical centers, community facilities, and private practice all were BBI trained and then reported BBI usage (i.e., the percentage of the patients seen in the prior month that were treated with the BBI). During months 1-6 they were provided with implementation support but none thereafter. Usage rates at 2, 4, 6, and 12 months were reported. A generalized estimating equation with a logistic link function was used to evaluate the level of BBI usage over time. **Results**. The model estimated an average BBI usage of 60.1% (95% CI=53.4-66.4%) at 2 months, 66.3% (95% CI=59.8-72.4%) at 4 months, 68.4% (95% CI=62.2-73.9%) at 6 months, and 70.9% (95% CI=63.6-77.3%) at 12 months. There was a significant difference in BBI usage from month 2 to 6 (p=0.010) and 12 (p=0.005). **Conclusions.** This first dissemination cancer-specific psychological intervention shows success at all stages. There were early, high usage rates which steadily increased during a 6 month period of implementation support. Moreover, usage rates even climbed to rates exceeding 70% at 12 months. The paradigm used here for the successful training of mental health professionals provides guidance for the dissemination of other behavioral medicine psychosocial interventions to community providers.

THE INFLUENCE OF RISK FACTOR FEEDBACK ON PARTICIPATION IN A DIABETES PREVENTION PROGRAM FOR AFRICAN AMERICAN WOMEN

Heather Kitzman-Ulrich, PhD[1], Abdullah Mamun, MS[2], Leilani Dodgen, MPH[3], Kisa Gant, BS[3], Surendra Reddy Mandapati, BDS[3], Ike Eke, BA[2]

[1]Baylor Scott & White Health, Dallas, TX; [2]University of North Texas Health Science Center, fort Worth, TX; [3]University of North Texas Health Science Center, Fort Worth, TX

Background: Previous research has found that providing health risk data, such as diabetes (fasting glucose or HbA1c) or cardiovascular risk (total cholesterol, high density lipoprotein, low density lipoprotein), can serve as a call to action and increase participation in prevention programs. However, little is known on how provision of health risk data increases participation in prevention programs for African American (AA) women, who are disproportionally affected by diabetes and cardiovascular disease (CVD). **Methods:** Data collected during baseline measures of the Better Me Within randomized study were used to evaluate whether risk status provided at baseline was related to greater participation in a 16-week church based diabetes prevention program. Physiological data was calculated from a fasting blood sample collected through finger stick by trained research staff using a point of care test (Alere Cholestech LDX Analyzer) including total cholesterol (TC), high density lipoprotein (HDL), low density lipoprotein (LDL), and triglycerides (TRG). Fasting glucose (FG) and glycated hemoglobin (HbA1c) were calculated with a fasting blood sample using a point of care test (Bayer A1cNow). Attendance was tracked for each individual by week and a mean attendance score was calculated. **Results:** 263 AA women participated in baseline measures (M_{BMI}= 36.5+8.1; M_{Age} = 51.6+11.9), 43.3% had an annual household income < $50,000, 26% had a high school education or less, 77.2% had at least one risk factor for CVD, and 74.1% had at least one risk factor for diabetes. Of the 5 CVD risk factors evaluated (TC, HDL, LDL, TRG, BMI), only borderline high or high TRG (>150mg/dL) predicted greater participation (>70% attendance of 16 sessions). Neither diabetes risk factor (FG or HbA1c) predicted greater participation. The strongest predictors of participation were household income, with 66% of higher income as compared to 51% of lower income participants (p=.01); and education, with 65% of participants with a higher education as compared to 44% of participants with a lower education (p < .01), attending at least 70% of the 16-week program. Conclusions: Greater participation in health promotion programs have been associated with better participant outcomes such as weight loss or reduced diabetes risk. These findings suggest that real time physiological feedback, for the exception of TRG, does not predict greater participation, and that education and income may be key drivers of individual participation rates. Future

research should explore mechanisms for increasing participation in prevention programs by individuals with lower incomes and less educational attainment as they are at higher risk for chronic disease.

THE ROLE OF MIDDLE MANAGERS IN INNOVATION IMPLEMENTATION IN HEALTH CARE

Robin Urquhart, PhD[1], Cynthia Kendell, MSc[1], Amy Folkes, MAHSR[1], Tony Reiman, MD[2], Eva Grunfeld, MD, DPhil[3], Geoff Porter, MD[1]

[1]Dalhousie University, Halifax, NS, Canada; [2]Dalhousie University, Saint John, NB, Canada; [3]University of Toronto, Toronto, ON, Canada

Objective: To explore middle managers' role in and experiences with innovation implementation in the cancer system.

Methods: We conducted a grounded theory study using in-depth, semi-structured qualitative interviews of middle managers in two Canadian provinces (Nova Scotia, New Brunswick). Participants were purposively sampled, based on their involvement in implementation initiatives and to obtain variation in manager characteristics (location, years of managerial experience). Interviews were audiotaped and transcribed verbatim. Data were collected and analyzed concurrently, using an inductive constant comparative approach.

Results: Seventeen middle managers participated in this study. Collectively, they were involved in the implementation of a range of innovations in cancer screening, diagnosis, and treatment. The analysis revealed four main categories. Middle managers see themselves as being (1) **responsible for making implementation happen** in their programs/services. As a result, they take on varied tasks, such as leading committees/working groups, navigating bureaucratic processes, gathering information, and developing new operational processes. At the same time, they have (2) **limited decision-making authority** with respect to the implementation decision, with middle managers working within parameters set by upper levels of the organization. Their role during implementation is akin to that of (3) **team captain**, executing leadership tasks but also very much a part of the team effort. This is often challenging, since middle managers (4) **perform many roles**, both clinical and managerial in nature, with innovation implementation added on top of their regular duties. Consequently, most engage in much self-directed learning to help them succeed in these multiple roles.

Conclusions: Middle managers are given scant attention in the implementation literature in health care, where the focus is on senior leaders and frontline staff. As a result, their contribution is often seen as negligible. This study suggests middle managers play a leading role in implementation processes. Optimizing their capacity to fulfill this role may be key to improve innovation implementation in healthcare organizations.

THEMATIC CONTENT ANALYSIS OF PRACTITIONERS' INQUIRIES ABOUT INTERVENTIONS: IMPLICATIONS FOR RESEARCH IMPLEMENTATION

Margaret M. Farrell, MPH RD[1], Jordan N. Tompkins, BA, MAA[1], Wynne Norton, Kaelin Rapport, N/A[2]

[1]National Cancer Institute, Bethesda, MD; [2]National Cancer Institute, College Park, MD

Background: Improving communication and strengthening collaboration between researchers and public health practitioners is critical for effectively disseminating and implementing evidence-based interventions. To this end, NCI's Research to Reality (R2R) online community of practice convenes researchers and practitioners around a shared commitment to implement evidence-based, cancer-related (e.g., physical activity, tobacco control, screening, prevention) interventions in public health settings. Several dynamic approaches are used to facilitate dynamic communication and collaboration, including monthly webinars, question and answer (Q&A) sessions, and discussion posts.

Methods: This study explored the programmatic considerations most important to R2R community members through a content analysis of webinar Q&A sessions and related discussions. We used deductive coding for segments of text related to implementation strategies (Powell et al 2015; Wang 2016) and intervention adaptation (Wiltsey-Stirman et al, 2012), and inductive coding to explore thematic patterns from participants' questions. This coding schema was applied to 62 transcripts of webinar presentations (Q&A section only) and the related online discussions over a 6-year period (2010-2016).

Findings: Several themes emerged from the content analysis, including queries around institutional support, sustainability, tools and resources. Community members requested additional information from presenters about contextual variables of research studies (e.g., the role of partnerships in implementing disease prevention and public health initiatives) as well as evidence-based programs. Practitioners consistently sought to better understand variables that made an intervention effective and sought guidance on the most appropriate implementation strategies for their projects.

Implications: While a number of resources are designed to implement evidence-based health programs, the strategies and programmatic considerations most salient to practitioners are difficult to elicit but essential to address. These data highlight additional information researchers should include in their intervention presentations, summaries and publications

when communicating with practitioners. By addressing the priority concerns of practitioners, researchers can to improve communication and enhance the actual, widespread implementation of promising public health interventions across jurisdictions.

TRAINING STUDENTS IN UNDERSERVED HIGH SCHOOLS ALONG THE US-MEXICO BORDER TO IMPLEMENT PROJECT STUDENTS ARE SUN SAFE (SASS)

Loescher J. Lois, PhD, FAAN[1], Sarah Rawdin, MPH, BSN, RN[1], Gail Emrick, MPH[2], Tashina M. Machain, BA[2], Denise A. Spartonos, BA[1], Alice Pasvogel, PhD[1], Riley E. Johnson, CITI[3], David Campas, B.S. Public Health [4]

[1]The University of Arizona, Tucson, AZ; [2]Southeast Arizona Area Health Education Center, Nogales, AZ; [3]University of Arizona Cancer Center Skin Cancer Institute, Tucson, AZ; [4]University of Arizona Health Promotion Research Assistant, Tucson, AZ

Background: Skin cancer is a major public health issue in the US and Arizona with overexposure to ultraviolet radiation (UVR) a known cause. Most people living near the rural Arizona-Mexico border are Hispanic; skin cancer incidence is rising within Hispanics. Youth are prone to UVR overexposure, yet few skin cancer prevention programs target rural and underserved youth. Schools are ideal intervention settings, but teachers in border-area high schools have limited time and resources for skin cancer prevention education. Educators and researchers at the University of Arizona (UA) have successfully implemented Project Students are Sun Safe (SASS) in urban schools. In the current model, UA health sciences students (peer leaders) take a one-semester skin cancer prevention academic course: online modules on skin cancer epidemiology, types, prevention and communication, followed by in-person skills evaluation. Trained peer leaders implement, in community classrooms, a brief SASS lesson (basic epidemiology, skin structure, skin cancer, UVR and protection strategies, and tanning consequences), reinforced by three interactive activities. Adapting this model for high school students will allow further dissemination and implementation of SASS, especially into rural and underserved schools.

Purpose: To report preliminary findings on the training of border-area high school students to deliver SASS, specifically a) adaptation process of the college course; b) strategies to engage the students in training; and c) evaluation of the feasibility and efficacy of the training.

Methods: Using a CBPR framework, our research team and community partner with a longstanding relationship with border-area high schools, jointly adapted the SASS training modules and classroom lesson. Eighteen students from 3 border-area high schools were offered the online training. They completed the online pretest and posttest at 3 weeks, measuring skin cancer prevention risk, knowledge, attitudes, and behaviors. We monitored successes and challenges of our strategies.

Results: The adaptation process of several months reduced the modules from 5 to 3. The students had no experience in online learning, which required adjustments in training. The majority of trainees were female, Hispanic, and had skin cancer risk factors: 83.3% were raised in Arizona; over 70% reported skin susceptible to sunburn, with 35% having 2+ sunburns the past year. Following training, sun-safety knowledge improved (p = .002), perceived seriousness (p = .000) and risk (p = .02) were more favorable, and self-reported sun safety behaviors improved (p < .005).

Conclusions: We successfully adapted SASS sun-safety training to youth living along the US-Mexico border. These students had stronger skin cancer risk factors than we anticipated. In January 2017, these students will take a final posttest to assess longer-term efficacy of training.

USE OF CONTENT CURATION, TAILORED CAMPAIGNS & SOCIAL MEDIA OUTREACH TO SUPPORT LATINO HEALTH

Amelie Ramirez, DrPH[1], Rosalie P. Aguilar, MS[2], Lisa Ellis, BA[3], Amanda Merck, MPH[4], Eric Moreno, MA Communications[5], Cliff Despres, BJ[1], Kip Gallion, MA[1]

[1]UT Health San Antonio, San Antonio, TX; [2]Salud America! /UT Health Science Center at San Antonio, San Antonio, TX; [3]Salud America, San Antonio, TX; [4]Salud America!, San Antonio, TX; [5]University of Texas Health Science Center at San Antonio, San Antonio, TX

Use of Content Curation, Tailored Campaigns & Social Media Outreach to Support Latino Health

BACKGROUND: By 2023, it is expected that 30% of public school students will be Latino. Despite rapid population growth and a longer life expectancy, Latinos face disparities in childhood obesity, diabetes, asthma, and certain cancers, which greatly reduces their quality of life and leads to increased costs of health care. In 2014, approximately 73% of Latinos reported using their smartphones to access health information from the Internet. *Salud America!* engages its 50,000+ member network through multi media content, research and e-communications aimed at empowering local level leaders and helping build their case for healthier, more resilient communities.

METHODS: Between Jan-Aug 2016, 3 SA! curators developed an average of 41 geo-tagged blog posts, 33 resource posts and 3 full-length feature role model stories per month. Tenets from social cognitive theory were used to craft campaigns and disseminate messages to support the growth of the *SA!* network and to raise intentions to advocate for policy and systems change. Research, infographics, and videos were used to highlight key issues affecting Latino childhood obesity rates. Materials were disseminated via @SaludToday's social media channels in addition to monthly e-news blasts and weekly #SaludTues Tweetchats. Facebook ads, and Google adwords were also used boost content.

RESULTS: In 8 months, SaludToday's Twitter account generated 2,500 tweets.The network gained 2,000 new followers and produced 17,000 engagements (all organically grown) on Twitter. On Facebook, SaludToday gained over 3,700 new fans and produced over 27,000 engagements. Twitter and Facebook are currently the most popular tools of engagement, however SaludToday's Instagram was the fastest-growing social media channel, with 14.08% follower growth (July-Sept. 2016). Facebook ads and boosted posts have increased user

engagement rates.

CONCLUSION: Social media engagement is a powerful way to reach audiences. Since implementing the use of paid ads, Facebook became the *SA!* webpage's primary source of social traffic. The role that *SA!* curators have in the *SA!* network has become central to the *SA!* hub. Public health officials should consider allocating resources to content curation and social media marketing.

E-MENTORING VIA TEXT MESSAGE: A MODEL FOR MAINTAINING PROFESSIONAL RELATIONSHIPS AND PROVIDING MENTORSHIP FROM ACROSS THE SEA

Zachary Jacobs, MD, Amy Kennedy, MD, Brian Primack, MD, PhD, Thuy Bui, MD

University of Pittsburgh Medical Center, Pittsburgh, PA

Background: International medical service affords the opportunity to work with and provide mentorship for local physicians-in-training. However, these relationships tend to rapidly dissipate after a brief stint abroad. Similarly, local mentor-mentee relationships may also quickly diffuse once participants transition to a new roles and/or institutions. For this reason, electronic mentoring (E-mentoring) may be a useful way to complement traditional face-to-face mentoring. The aim of this study was to assess the feasibility of using a mobile application (app) to sustain pre-existing mentoring relationships between Global Health residents at the University of Pittsburgh Medical Center (UPMC) with local Malawian medical students.

Methods: In 2015, we developed a mentoring group involving UPMC Global Health residents and local medical students at the University of Malawi College of Medicine. The group met weekly for eight weeks during our stay in Malawi. After our return to our local institution we maintained these relationships using the text-messaging program WhatsApp. Each week we sent inspirational quotations and clinical pearls relevant to practice in the resource-limited setting. These quotations and pearls were tailored by each resident based on her/his in-person experiences with the Malawi residents.

Results: There are currently a total of 31 members in the WhatsApp mentoring group. From March 2016 until the present, there have been a total of 76 unique unsolicited student responses to the weekly messages. This represented an average of 10 responses per month and 3 responses to each individual teaching post. One hundred percent of the 76 student responses were positively valenced, with responses expressing gratitude, positivity, and interest in the information provided.

Conclusions: These findings suggest that it is feasible to leverage the text-messaging program Whatsapp to maintain mentor-mentee relationships that end due to distance. While we used this platform to provide weekly inspirational messages and clinical pearls with local medical students at the University of Malawi College of Medicine, the specific nature and frequency of communications can be tailored based on the particular needs of mentors and mentees. In the future, we hope to provide prompts to encourage students to pose their own clinical questions and experiences, and also to share strategies for coping with stressful situations.

A TWITTER ANALYSIS OF MEASLES AND VACCINATION CONVERSATION DURING THE 2015 MEASLES OUTBREAK

Loren Saulsberry, PhD [1], Vish Viswanath, PhD[2]

[1]Harvard T.H. Chan School of Public Health, Cambridge, MA; [2]Harvard T.H. Chan School of Public Health, Boston, MA

Background: An evolving communications landscape has made social media applications like Twitter a popular platform for conveying opinions to a broad audience. Given its increased utility as an information exchange tool, Twitter provides insight into public views and perceptions that could impact health-related behaviors. We evaluated Twitter discourse on measles and vaccines during the 2015 measles outbreak to determine the evolution of dominant themes of the online conversation and identify how Twitter was used for communication during this critical public health event.

Methods: We analyzed over 745,000 posts on Twitter related to measles and vaccines during the 2015 measles outbreak (December 7, 2015-May 7, 2015) using social media analysis software provided by Crimson Hexagon. We captured relevant conversation from Crimson Hexagon's data library of all public Tweets. We established the key messages driving online conversation, traced the evolution of those themes, and determined the online authors with significant influence.

Results: The online conversation on measles and vaccines evolved over time with some messages gaining popularity. Twitter discourse included vaccination advocacy, criticism of vaccines and support for anti-vaccination movements, descriptions of personal experiences with measles/vaccines, and news reporting. Twitter users also shared stories from news organizations, locations of newly confirmed measles diagnoses, and information on persistent measles cases. News and public health organizations were some of the most influential authors on Twitter.

Conclusions: Posts on Twitter discussing measles and vaccinations became increasingly polarized (supportive or oppositional) towards vaccination during the outbreak. Twitter was an online news source and a sentinel for the spread of measles for its users. Twitter's capability to reach large audiences presents an enormous potential to impact public views that influence behaviors. Since news and health organizations were influential Twitter authors during the measles outbreak, Twitter may be an impactful channel for disseminating vital public health information during critical, fast-moving public health emergencies. While

traditional research approaches often focus either on how messages are transmitted or received, Twitter analysis enables real-time assessment of media messages about the outbreak, the public's reactions to unfolding events, and the evolution of both over time.
