THINK BIG  WE DO™

# Part I: Introduction

THINK BIG  WE DO™

THE  
**UNIVERSITY**  
OF RHODE ISLAND

## Background

- Adherence to medical recommendations
  - Reduce preventable mortality, improve outcomes, save health care money
  - Sleep disorders have the poorest rates - around 65%

THINK BIG  WE DO™

## Background (continued)

- Obstructive sleep apnea
  - At least 2-4% of middle-aged adults
  - More prevalent in men
  - Repeated cessations of breathing
  - Daytime sleepiness, decreased cognitive performance, irritability, depression
  - Higher rates of mortality: hypertension, other cardiovascular disease
  - Poor adherence

THINK BIG  WE DO™

## Background (continued)

- Positive airway pressure (PAP)
  - The standard treatment
  - PAP device
  - Daily use data

THINK BIG  WE DO™

## Background (continued)

### **How do we analyze adherence behavior?**

- **Group-level**
  - Nomothetic
  - Many individuals
  - Small number of occasions
  - Inter-individual variability
- **Individual-level**
  - Idiographic
  - One individual
  - Large number of occasions
  - Intra-individual variability

THINK BIG  WE DO™

## The present study

- Secondary data analysis
- Address the issue of poor adherence with individual-level and group-level approaches
  - 1) Time series analysis
  - 2) Dynamic cluster analysis
  - 3) Group comparisons with variables associated with adherence

THINK BIG  WE DO™

# Part II: Methods and Results

THINK BIG  WE DO™

THE  
UNIVERSITY  
OF RHODE ISLAND

# Participants

- 161 patients diagnosed with OSA
- Five different sleep centers
  - CA, FL, CT, AL, Berlin
- 72.7% male
- Age: 21-75, mean age = 48.9
- Approx. 180 days of data per participant

THINK BIG  WE DO™

# Measures

- Hours per night
  - Connected to machine, pressure being administered
- Demographics
  - Age, height, weight, BMI, blood pressure, heart rate, education, ethnicity
- Sleep apnea variables
  - AHI, PAP pressure, ESS, FOSQ, PVT
- Psychosocial variables
  - ATUQ, VAS (perceived sleep quality, satisfaction comfort, benefit)

THINK BIG  WE DO™

# Time Series Analysis

- Idiographic method: separate analysis for each participant
- Nightly use
- Mean of the series, level, slope, autocorrelation, variance

THINK BIG  WE DO™

# Time Series Analysis: Results

- Heterogeneity of individuals
  - Mean, level, slope, autocorrelation, and variance
- Slope
  - Significant for 46.6% of the sample
    - 25.3% positive
    - 74.7% negative
- Autocorrelation
  - For most, very small

THINK BIG  WE DO™

# Dynamic Cluster Analysis

- Cluster analysis groups multiple variables on a single occasion
- Dynamic cluster analysis groups a single variable across multiple time points
  - 180 days = 180 variables for clustering

THINK BIG  WE DO™

# Dynamic Cluster Analysis: Results

# Group Comparisons

- Establish external validity of the clusters
- Demographic variables, sleep apnea variables, psychosocial variables
- Baseline, 30, 90, 180 days
- ANOVAs and chi-square tests

THINK BIG  WE DO™

# Group Comparisons: Results

- Mostly non-significant, small effect sizes
- Evidence for external validity

THINK BIG  WE DO™

## Notable comparisons

- Ethnicity
  - Not equally distributed, large effect at baseline
  - Participants that were black or African American more likely to be in the Poor Users Group
- ESS (sleepiness)
  - Significant differences, medium effect at day 90, medium effect at day 180
  - Poor Users reported the most sleepiness
- ATU-A (self-efficacy)
  - Significant differences, medium effect at day 90, large effect at day 180
    - Largest effect size of any of the variables
  - Great Users reported the most self-efficacy

THINK BIG  WE DO™

## Comments on comparisons

- Ethnicity
  - 79% of the sample was white, only 11% of sample was black
  - May be related to sleep center
- Self-efficacy
  - Intervention?

THINK BIG  WE DO™

# Part III: Discussion

THINK BIG  WE DO™

THE  
**UNIVERSITY**  
OF RHODE ISLAND

# Dynamic Typology

- Time series analysis and dynamic cluster analysis
- Allows for the consideration of subgroups in the data while still respecting individual differences

THINK BIG  WE DO™

## Take-home messages

- Individual-level differences are important for complex behaviors such as adherence
- Similar individual patterns over time can be grouped together
- External variables can be used to explore differences among these groups
